

XI. N4

The India Rubber World Index

VOLUME LI

October 1914, to March, 1915

VOLUME LII

April 1915, to September, 1915

NEW YORK:

THE INDIA RUBBER PUBLISHING CO.
1915.

A

Abrading Machine, New.....	*659
Accelerator, Vulcanization.....	323, 493
Accelerene.....	129
Accessories, Rubber Stamp.....	*497
Accidents, Prevention of Electrical.....	143
Adams, Arthur H., Death of.....	502
"Adamson" Hose Wiring Machine.....	*440
Aerial Preparedness.....	(Editorial) 583
AERONAUTICS—	
Balloon Contract Awarded by Navy Department.....	508
Navy Dept. Asks Bids on Dirigibles.....	400
Manufacture of Balloon Fabrics in Europe.....	649
Rubber in Military Aviation.....	*368
Parachute for the Aeroplane.....	18
Testing of Balloon Fabrics.....	*69
"Aeroplane," Rubber in the.....	*665
Africa, French Occidental, Future Production.....	230
German East, Rubber in.....	519
Gold Coast, Para Rubber From.....	230
Rubber on the Gold Coast.....	519
African Rubber in the London Market.....	45
Agricultural Colleges, Eastern and Western.....	49
Air Bag for Repairing Tires.....	661
Brake Hose, Machine for Armoring.....	661
Pump Connection, Rubber.....	*91
Spring, Cox.....	*621
Akers, C. E., Death of.....	453
Akron Rubber Trade.....	26, 83
151, 218, 285, 342, 458, 513, 562, 618, 676	
Albumen, Egg and Rubber.....	494
Aldrich, Nelson W., Death of.....	454
Alcemic Rubber.....	*284
Alkylated Creosol as a Preservative.....	648
Alodium.....	*438
Amazon, The Lower.....	(Book Review) *204
Trade Conditions.....	353
America and the European War.....	125
American Advertisements Barred from German Papers.....	(Editorial) 476
Banks in South America.....	(Editorial) 61
Export Trade Directory.....	(Book Review) 259
Express Co. Helps Rubber Club.....	662
Chemical Society, Fiftieth Meeting.....	397
Manufacturers and the War.....	(Editorial) 181
Planter in Mexico Raided.....	339
Rubber Boots for the Allies.....	108
Among Rubber Collectors in So. American Hinterland.....	*62
Amusement Resort Devices.....	*329
An Even Hundred Million Americans.....	(Editorial) 311
Analysis.....	
Chemical, An English View.....	428
Machine for Repairing Rubber for.....	601
of Insulating Materials.....	265
of Rubber.....	127, 264
of Rubber and Compounds.....	378
of Rubber Goods and Insulation.....	265
of Rubber Substitutes.....	652
Reagent for.....	647
Analytical Chemistry, Too Much.....	256, 462
Analytic Method for Sulphur in Rubber.....	493
Anniversary, Congratulations on Twenty-fifth.....	209
Antwerp, Belgium and Its Rubber Trade.....	*120
Imports of Crude Rubber.....	*120
Ancient and Honorable Artillery Company Record.....	(Book Review) 274
Apparatus for Testing Impermeability of Fabrics.....	*660
Appeal of Joint Committee on Embargo.....	147
Apron Feed for Mining Mills.....	489
Apsley Rubber Co., Thirty Years' Progress.....	335
Argentina, Cotton in.....	573
Tires in.....	573
Armies of the World, Use of Rubber in.....	*124
Arminius, Statue of, in Rubber.....	*184
Armor Plate, Rubber for War Ships.....	290
Armored Hose.....	489
Army and Navy Requirements, British.....	96
Asbestos and Cement Sheet Making Machine.....	*439
and Rubber Compound, a New.....	133
Packings.....	68
Production.....	665
Associated Manufacturers of Electrical Supplies.....	397

ASSOCIATIONS—

Associated Manufacturers of Electrical Supplies.....	397
International Association for Rubber Cultivation in Netherlands East Indies.....	571
Mechanical Rubber Goods Manufacturers' Association Joins Rubber Club of America, Inc.....	203
Motor and Accessory Manufacturers, Meet.....	250
National Association of Cotton Manufacturers, Financing New Crop.....	24
National Association of Shoe Wholesalers.....	281
Para Commercial Association, Anniversary.....	231
Rubber Growers' Association of London.....	192
Rubber Trade Association of New York.....	79, 145, 203
Society for Testing Materials, Annual Meeting.....	611
Society of Chemical Industry, Annual Meeting.....	679
Waste Material Dealers, Banquet.....	*393
At Any Rate It Is Fine for Guayule.....	(Editorial) 4
Athletic Accessories, Rubber in.....	*90
Atomizer for Hospital Use.....	*534
Auction Sales, Suspension of British.....	162
Australia, Rubber Goods, Exports from.....	625
Austria, Rubber Conditions in.....	350
Austrian Rubber Regulations.....	463
Auto-Bus and Trolley.....	(Editorial) 313
Auto Camp Bed and Tents.....	*541
Auto-Ped, The.....	492
Automobile Chamber of Commerce, National Motor Truck Exports.....	337
Automobile Engineers, Proceedings of Society of.....	262
Exports for 1914.....	66
German Restriction of Use.....	385
Salon for 1915.....	262
Show, New York's Fifteenth.....	*260
Shipping Tire-Equipped, to Neutrals.....	662
Rubber in Ford Cars.....	690
Tire Treads.....	*263
Aviation, The Part Rubber Plays in.....	*368

B

Babcox, Edward S., Delivers Address.....	443
Bag, Changing, for Photographers.....	*91
Waterproof.....	*328
Bait, Rubber.....	*498
Bakelite—a Substitute for Hard Rubber.....	*483
Bakelite Patents Declared Valid.....	666
Balata, "Non Separable" Belt.....	482
in Dutch Guiana in 1914.....	683
Imports and Exports.....	357
Industr., The War and the (British Guiana).....	*107
Industr., The War and the (Dutch Guiana).....	170
Monopoly in Dutch Guiana.....	352
Ordinance in Dutch Guiana.....	352
Ball, Hollow, of New Design.....	*89
Mold and Press.....	*600
Temps, Inflator and Scales.....	*543
Ball, Golf, "Diamond Ace".....	*437
Painting Device for.....	*199
"Whippet".....	*383
Balls, New Rubber.....	*654
Balloon Contract Awarded by Navy Department.....	508
Fabrics, Manufacture of, in Europe.....	*649
Fabrics, Testing.....	*69
The Squawker.....	598
Balloons, Toy.....	*270
Making Gas Bags and Fabrics for.....	183
Banking Procedure in Brazil.....	353
"Bantam" Soles.....	330
Barr, Guy—Mention of Paper on "Rubberized Fabrics".....	326
Barthelmy, Henry—Reclaiming Rubber Solvents.....	324
Basin, Wash.....	*268
Bavatia, A Rubber Market in.....	410, 528
Botanical Gardens.....	*258
International Rubber Exhibition.....	168, 207

Rubber Congress Awards.....	258
Papers Read at.....	*257
Rubber Market.....	528
Trading Direct with.....	465
Bates, Andrew J., Death of.....	346
Bathing Novelties and Accessories.....	*381, *540
Bathtubs, Folding, for the Army.....	460
Bead (See also Tire Bead).....	
Adjusting Device.....	*491
Fabric Tearing Machine.....	*490
Forming and Covering Apparatus.....	*491
Trimmer, Johnston.....	*272
Trimmer, Meir's German.....	*332
Beck, Raymond.....	(Portrait) 25
Bed, Auto Camp.....	*541
Cushion.....	*268
Pan.....	*268
Beer's Quick Acting Vulcanizing Press.....	*41
Being Independent When You're Not.....	640
Belgium, Mr. Buckleton's Home for.....	148
Belgium and Its Rubber Trade.....	120
Belgian Congo, <i>Funtumia Elastica</i> in.....	571
Bell, Alexander G.....	(Portrait) 424
Belligerent Countries, Foreign Trade of the.....	10
Belt, Balata "Non Separable".....	482
Belt and Packing Machine.....	*659
Benedict, E. C., Commodore, British Government Thanks.....	445
Entertains Musicians.....	556
Rescues Crew.....	338

THE TEST THAT TELLS

Ten or Fifteen years' continuous service without interruption for repairs has often been obtained with Bristol Recording Instruments. The unique simplicity of construction of

RECORDING
INSTRUMENTS

is responsible for their great durability and reliability in long continued service.

Take the case of Bristol Recording Gauge, Model 10, Serial No. 4038, which was shipped August 26th, 1900, and never returned for repairs until December 1st, 1913, when this recorder was found to be in fine working order except for replacement of the inking pen.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE FLOOD-TIDE OF OPPORTUNITY.**

SOMETIMES it happens that reasons, astronomical and meteorological, are combined to bring upon a coast a high tide, the memory of which lives in history, legend and song. Whether it brings disaster or opportunity, the high-tide of a lifetime or of centuries brings the time for action. This year of 1914 brings to American exporters a high tide of opportunity such as they have not known before and will not know again. They have had seven years of practically unchecked prosperity.

The old threats of unsettling the monetary standard are as dead as that of danger from the French and Indians. We have a financial law satisfactory alike to conservative bankers and to merchants anxious for expanded credits—a law which, in the opinion of most financiers, makes forever impossible the recurrence of the old-time panics. The Panama Canal has been opened, giving easy access to new markets and giving the American a position of vantage at the meeting place of the commerce of the world. The tariff law recently enacted opens our markets to return cargoes from the countries of the south—wool, meats, lumber and sugar being added to the free list, which already held the great staples of coffee,

rubber and cocoa. Steps have already been taken under the new banking act to establish American branch banks in the most important cities of South America and such banks are certain to be multiplied, having close relations with the existing South American banks.

With this flood of opportunity comes the tremendous fact of the great European war, which in a moment absolutely annihilates the export trade of the country holding second place among the trading nations of the world. Until peace is declared, or there is accomplished the improbable event of Germany obtaining control of the sea, the great export trade of that country lies open to pre-emption on the part of whoever is sufficiently alert and enterprising for the task. The British are going after this trade with all the energy they may summon, but they have the distraction of a war which has threatened their national life and a war expenditure of not less than three million dollars a day, and they have plenty to do in looking after the trade which they already possess.

The old complaint of lack of direct lines is in a fair way to be obviated. Americans may now go into the markets of the world and buy ships as they may buy other things necessary to commerce and industry. Our country, during the next twelve months, will have more money free for the best-paying enterprise than all the rest of the world combined. Nothing stands in the way of a vast extension of American trade, except the failure of the manufacturers to take full advantage of their opportunity.

If they look for "easy money" by marking up domestic prices and say, "Who cares for abroad?" they will get their answer soon enough. They will enjoy their ease for a year or two and then find themselves hard pressed in their own markets by the competitors they have allowed to distance them in the trade which might have been theirs. They must go after the Spanish-American trade with promptitude and vigor. They must make immediate and intelligent effort to find what classes of goods are wanted in the various countries and send agents who speak Spanish and who understand the business and social customs of the people whose trade they are to solicit—not demand. They must get out attractive and intelligible catalogs in the language of the country to which they are going. They must take pains to fill the little orders with exactly the goods the customer desires. They must obey shipping directions implicitly and to the last letter. If they fail in this regard, they lose all that effort has gained. They must give as good credit as their customer has hitherto received from Euro-

pean houses. The new banking law will enable them to get the money necessary for this feature, if they should need it. For reasons not necessary to be described, the feeling toward us in Spanish-America is better than for a long time past. If the American manufacturers go into this magnificent market with the proper spirit—and manners—their children and their children's children will enjoy the profits of that trade.

THE WAR AND THE ENGLISH RUBBER TRADE

WHAT effect the war has had upon the rubber trade in Germany can only be surmised, as the channels of communication between that country and the outside world are to a great extent closed, but it can safely be conjectured that, outside of those lines that would contribute to the efficiency of Germany's military and naval operations, the rubber trade of that Empire is in a state of at least temporary paralysis. The effect of the war on the rubber trade in England is described in considerable detail in the letter which appears in this issue from our regular English correspondent. He states, as would naturally be assumed, that the companies engaged in the manufacture of rubber flooring for tents, motor tires for transport wagons and ambulances, rubber sheeting, elastic bandages for hospital use and other articles used by the army and by the Admiralty are running on government orders that keep them at full capacity during the entire twenty-four hours, but other companies whose products are intended for use in peaceful vocations are generally operating only on part time. This is due, to a certain extent, to the large number of men who have been withdrawn from work in the factory to go with the forces in the field—in one case a thousand employees having left a company for military service—but even to a greater extent this idleness is due to the decreased demand for merchandise generally.

The English manufacturers appear to have all the rubber that is needed under the present conditions of the trade, and with the exception of one chemical—zinc oxide—the English supply of which has come largely from Liege in Belgium, the supply of compounding ingredients promises to be ample. But the present situation in England is another illustration of the fact that while war excites certain lines of industry—those that contribute to military equipment to feverish activity, the effect upon all other lines is deadening and in time disastrous.

MR. COWEN AND THE MARKS PROCESS.

IN the very interesting lecture delivered by Mr. L. J. Plumb before an English commercial school in England recently, the speaker said, speaking of the Marks alkali process: "It is probable that he received his first knowledge as to the effect of caustic soda on rubber from his superior, Mr. Robert Cowen. As early as 1890 Mr. Cowen in private conversations had discussed the possibilities of using caustic soda for reclaiming, and there is no question but he made a number of experiments along these lines."

It happens that the editor of THE INDIA RUBBER WORLD was a close friend of Robert Cowen and, living in Boston, was a very frequent visitor at the factory of the Boston Woven Hose & Rubber Co. When the little laboratory was first installed and the young men from the Massachusetts Institute of Technology brought in, he met them all and their work was thoroughly gone into. Mr. Cowen was a fine machinist and an inventor, but he was not a chemist. As the writer remembers it, he was wholly in favor of the acid process for reclaiming. When Mr. Marks succeeded with his alkali process and went on record as to its great future value, it was put down as a bit of youthful enthusiasm not to be taken seriously. When Mr. Marks resigned to join the staff at the laboratory of the Revere Rubber Co. his alkali process was not even considered. It was not until he had made a success of it that others were said to have suggested it, to have experimented along the same lines or to have anticipated him. Were Robert Cowen alive today he would in his frank way give Mr. Marks full credit for his process.

A WAR TAX ALTHOUGH NO WAR.

NOTWITHSTANDING the Government's determination to maintain strict neutrality during the present disturbed conditions in Europe, it cannot altogether escape the effect of those unhappy conditions. Customs receipts have fallen off to such an extent that the Administration has been compelled to cast about for sufficient revenue for the efficient operation of government functions. The measure before the Senate Finance Committee—known as the War Tax Revenue Bill—which is designed to raise a yearly revenue of about a hundred million dollars, lays a particular burden upon the brewer, wine grower, tobacco producer and purveyor of amusement. On the rubber manufacturer as such no special

burden is laid, but indirectly he, with all others actively engaged in the transaction of business, will have to pay a stamp tax on various documents for instance, promissory notes, insurance policies, deeds and mortgages.

It is the contention of the minority party that the Administration might better economize in sundry directions than to increase tax rates, but economy is a virtue more generally preached by the opposition party than practised by the party in control. The subject of taxation is one that has received the best attention of the economists for generations but there is one variety of tax that none of them has yet appeared to be able to devise—a popular tax.

NORTH AMERICAN BANKS IN SOUTH AMERICA.

MENTION was made in the August issue of this publication of the purpose of the National City Bank of New York to establish branch organizations in Rio de Janeiro, Buenos Aires and probably other cities in the republics to the south.

American banks are greatly needed in South America. The European banking houses established there have hitherto accommodated the ordinary routine of American trade, but they have naturally withheld the full measure of interest and solicitous support accorded to enterprises of their own nationality. The English and German bankers have transacted the larger part of the business pertaining to foreign commerce and have steadily extended a network of branch banking institutions and exerted their influence to the advantage of European trade. European banks not only finance trade between their own countries and South America, but also between the various Latin-American nations. They supply their home offices with ratings and characteristics of South American firms and individuals. The German trade was extended largely by aid of longer credits than are granted by other countries, and German banks have been made more minute in their service and organization.

BRITISH WAR ON GERMAN TRADE.

BRITISH merchants and manufacturers have followed their government in declaring war on everything German. For the time being, Germany, as a competitor in foreign trade, is down and out. Except for an insignificant amount of trade going to Holland, Switzerland and Scandinavia, German exports can go only as far as her armies may march. In a few months, or years, peace will be declared and Germany will go out among the na-

tions of the earth to pick up the trade she has dropped. Will she find it? The English are determined that she shall not. Newspaper organizations and private workers are calling with all their energy upon the British business men to deal a blow to the foe by going after the trade of Germany and Austria in every quarter of the globe. It is urged both as a patriotic duty and as sound business policy. It is held, looking from their own standpoint, of course, that they are engaged in a righteous war and that a blow which weakens the enemy is one which should be delivered if possible; that the great losses brought to them by the war they may honorably recoup in this way; that a realizing sense of the trade going to irrevocable loss will move the enemy to a desire for early peace, and that, finally, the British want all the trade they can get.

With characteristic British thoroughness, the campaign is being organized and forces mobilized for the attack. The Board of Trade has made special arrangements for an exhibition of samples of goods of German and Austrian make. Statistics of the trade of the hostile countries are furnished to the manufacturers, who thus can see the magnitude and location of each market and exactly what goods have been going there. Short of having the orders rounded up for them it is hard to imagine what further the manufacturers could ask. At the same time they are being warned that they have more to do than merely to pick up derelict trade. The Germans have been very thorough in their methods. The offer of unsatisfactory substitutes would be only a stop-gap performance, holding the customer for the German manufacturer until the latter was able to supply the customer's wants.

A heavy blow has been dealt to hostile foreign competitors by canceling, under certain conditions, "blocking" patents held by subjects of Austria and Germany. This was at first reported in such a form as to create a misapprehension. It is not intended to interfere with any patent under which active manufacture of the patented article is going on in Great Britain, but only with those which under British laws forbid the manufacture of an article which is made in Germany. Upon the payment of a fee of two pounds, any British subject can obtain permission to manufacture any article covered by one of these "blocking" patents. The applicant must also show his "bona fides" that he actually intends to carry out in good faith the manufacture which the patent has hitherto blocked. In the matter of drugs and chemicals this is likely to have an important effect, many articles essential to present-day arts being held as a close monop-

oly by German firms and sold at prices enormously in excess of cost and ordinary profit.

Manufacturers are just now inclined to hold back for assurances that if they put large capital into a new enterprise this capital will not be rendered valueless by an early peace and a restoration of the blocking patent. It is likely that these assurances will be given. In the meantime, the vast and well-oiled machinery of the British Consular Service will be working in every quarter of the globe in a way which can scarcely fail to be of as great damage to the German material interest as that being waged by the armed hosts now on the battle fields of Europe.

SHIPPING LATEX TO LONDON.

REPORTS which apparently emanate from London have recently come across the water to the effect that a group of English capitalists, having secured from an inventor a secret process for treating latex, intend to ship it direct from the plantations to England and convert it into rubber by this new process. All of which is interesting, but hardly likely to occur.

In the first place, the shipping of latex to London, New York and other points quite distant from the place of gathering is no novelty. To be sure it never has been shipped in large quantities, for there has been no reason to make such shipments, but wherever any quantity of latex has been desired for purposes of experiment or exhibition it has been found possible to ship it without having its qualities noticeably affected during transportation. And in the second place, there would be no advantage in shipping latex in bulk to a considerable distance from the plantation, for any process capable of converting latex into rubber in London would be capable of bringing about the same result on the plantation or in the forest.

GERMANY'S VAST MANUFACTURES.

THE stupendous German manufacturing trade which on the day that Emperor William handed his passports to the British Ambassador passed into the things that were, has a more than academic interest to a country like ours, which ranks fourth in manufactured exports among the nations of the world. Some day, we may be sure, Germany will again be one of the great exporting countries. But at the present time she may be considered as completely eliminated from the field of international commerce. Speaking in round

figures, the exports of manufactured goods recently amounted to about two thousand million dollars a year for Great Britain, fifteen hundred million for Germany and seven hundred million for the United States—the exports of the latter being largely of a sort in which cost of raw material is the chief factor and not the “added value,” which makes export trade profitable to the exporting nations. France has hitherto exported rather more manufactures than the United States, while Austria lags behind with less than half as much, or about \$250,000,000. This is quite a tidy bit of trade, however, and it is prostrate along with that of Germany. A feature of great interest is the fact that fully ten per cent. of the great German export trade found a market in the British Empire. This trade is not readily going to Germany after the close of the war. In the British Colonies, in Spanish America and in the Far East there are rich markets waiting for somebody—markets which Germany supplied but can do so no more.

These statistics of German rubber manufacture are of special interest to readers of this magazine.

AT ANY RATE IT IS FINE FOR GUAYULE.

THE mighty conflict in Europe has put the Mexican situation very much in the background, but the turbulent little republic still goes on its merry revolutionary way. But in all this gratuitous—one might almost say grotesque—loss of life and property, the humble guayule shrub is deriving a distinct benefit, for it is getting a much needed rest. Three years ago, when the factories were busily extracting its rubber content, it appeared to be approaching a condition of practical extinction, but since the overthrow of the Madero regime the guayule shrub is about the only thing in Mexico that has been left undisturbed! It needed the rest badly and has used it to great advantage. When the Mexicans get tired out with shooting one another, as they will some day, and settle down for a brief period of tranquility, guayule should once more be an interesting feature of the rubber market.

THERE ARE FOUR LINES OF RUBBER MANUFACTURES in which the Germans took the lead: Rubber Toys, Hard Rubber, Ocean Cables and Asbestos and Rubber Packings. With their export impossible and the factories idle, the opportunity for American and English rubber manufacturers is obvious.

TIRES ARE CONTRABAND BECAUSE THEY ARE A PART of military equipment. Why not because they are explosives?

What I Saw of the War.

By the Editor of THE INDIA RUBBER WORLD.

MORE than a year ago I promised to attend the Rubber Congress to be held in Java in September, 1914. It seemed more than likely that from that gathering would come an immense amount of good to the whole rubber planting world. It was up to the scholarly Dutch to solve the final problems and show the way to cheaper and better plantation rubber. That was expecting a great deal, but their record in cinchona and other tropical products justified such belief.

To do my part I had, first, a hundred lantern slides to show the planters just how rubber was manipulated when it got to the factory; second, an essay showing what manufacturers desired in crude rubber, and, having acquired the cup habit, I had presented a cup. Moreover, although the committee had offered to give me a generous sum for expenses I had refused it. Hence, optimistic, sure of a welcome, positive that the congress would be great in results, I made ready to go by the shortest route. That was by an Italian line to Genoa, Italy, and thence by a Dutch boat to Batavia. Premonitions of evil I had none. Prophetic hints were of no effect. For example, Edgar Beecher Bronson, the war correspondent, the night before my departure said: "Sure you are not going into *Closed Territory*?" I assured him that big game hunting or war would not come within my ken. Nor when Dr. Hornaday, sending me his book on the birds of Java, wrote on the fly leaf a happy phrase about my going to the "firing line" did it stir me.

ON THE DUCA D' AOSTA.

The embarkation was without tremor. Finding the one steward who would talk a little English and good Spanish we settled down to enjoy the trip. By a bit of good luck we became friendly with one of the wireless operators. He spoke English slowly, but wrote it exceedingly well, and was good enough to post the news in English for the benefit of the six English-speaking passengers. Five days out we learned that Austria and Serbia were at war. There came reports of what Germany, Russia, France and England said they would do, if either of the others did certain things. Then the occupation of Belgium and the big war was on.

*Mr. Bronson's book "In Closed Territory" is a personal narrative of big game hunting in East Africa.

In spite of the excitement we played deck and ate three meals a day and enjoyed ourselves.

Passing Gibraltar at three in the morning a half dozen British war ships slid by and out to sea. Two days later out of the morning haze came a cruiser head on at full speed as if she meant to cut us in two. We stopped and signal flags bobbed up and down, and the wireless, frantically chattering, told the story of who and what we were. We satisfied the investigator, and in a curve that rolled up a huge wave she steered off. Then as it grew lighter we saw that she was a scout for the French fleet, some fourteen vessels of which we could make out in the distance.

Our first call was at Naples, where the American Consul was discovered up to his eyes in work issuing passports and quieting hysterical women travelers. He had little news and no cables. The next day we reached Genoa, and gladly paid a bandit five lire (a dollar) to take our luggage off the ship and deliver it to a brigand who for another five lire took it into the custom house, where a freebooter put it on the baggage wagon for ten lire. We reached the hotel without further depletion of our store of ready money.

The next day things moved rapidly. First to the Dutch line, where a cable from Java announced that the Congress was postponed; then to the American consulate which was crowded with other Americans; and all we could learn was that we must report there every day. No bulletins, no news, no newspapers! Then to the bank to find that letters of credit were not honored.

My host at the "Miramara" was a Swiss and, luckily, a fellow townsman of the late Dr. Jacques Huber, of the Musee Goeldi at Para. The mention of Dr. Huber's name worked wonders. My American money was taken or exchanged at full value. The assurance was given that we could have what we wished and pay whenever letters of credit were good again. Nevertheless I made the daily rounds of the banks, and finally things loosened up a bit; one gave five pounds, another four and one twenty. My request was always for fifty

But Italy was mobilizing and war seemed imminent; so we decided to go either to England, Spain or Portugal. To the British consul we went, and he told us of the "Cretic" sailing the next day. A few quick trips to the American consul

THE EDITOR OF THE INDIA RUBBER WORLD
"ON WATCH."

RESTING ON THEIR WAY HOME.

papers showing citizenship, to Cook's office for drafts for passage against my letter of credit, to the White Star office to exchange the drafts for tickets, and we were steerage passengers bound for England.

After a last visit to the cable office that accepted money for cables that never were sent, we went aboard the boat, first buying steamer chairs, and prepared to make ourselves comfortable. It was easy to see that the boat was overcrowded, ergo so would the dining saloon be. Five dollars to the head steward placed us in the "first sitting." That meant breakfast at eight, instead of nine or ten. Then we hunted a good place for our chairs—one cool but not cold, and not likely to be swept by rain. Then we looked the baths over, and a very little figuring showed that many would perforce go bathless. Then we faced the steerage. We were located in Compartimento 2, Cuccetta N. 5 and 6. It took some time to find it, but by getting the stairways located, and guided by the galley smells first and the bilge odor second, it became in time quite easy. It was bad, but not so awful bad—better at least than many of the Central American boats, for there were no pigs, dogs, crying babies or seasick women. There were several fleas, and one could find bed bugs, and that in spite of the formaldehyde odor that spoke of recent fumigation. Naturally the steerage was in the bowels or rather the intestines of the ship. Our "compartimento" was a big room, filled with racks made of gas pipe, double tiered, on which lay narrow burlap mattresses filled with hay. On each was a red wooden blanket and a single white sheet—clean, too. The ports were open and the air was warm, but sweet. We did not sleep there, preferring to take mattresses and blankets up four flights of slippery stairs and camp

under the stars. As cabin passengers and all felt the same way, the decks were fairly well cumbered, and a wonderful variety of pajamas and bath robes was displayed.

There were only eighty Americans, and the six hundred Britons took the whole affair as a matter of course, so there

was no guying and little horse play, and soon the whole proceeding became as matter of fact as if it had been a life-long custom. There was one break in the solemnity. A huge man, said to be a distinguished scientist, elected to bed down on a hatch, where the smoking-room lights were brightest. He wore a thin cotton night-shirt only, and as he stood up to make his bed his anatomical idiosyncrasies were plainly displayed. An occasional wet sponge thrown by a compatriot, and the sewing up of the night-shirt in no way dis-

composed him, and he continued his shadowgraphs to the end of the voyage.

Most of the regular crew had gone to the wars and the raff that were shipped in Genoa were very able and persistent thieves. They went through the steerages and looted trunks

and stole suitcases, until one hundred of us were made special police. We stood two-hour watches, day and night, and thus put an end to their thieving. Stewards were few and overworked (so were bath towels), and passengers turned to and wiped dishes. Indeed, the American ladies, too, both wiped and swiped, for guests though we were the souvenir instinct was too strong to be resisted, and

after-dinner coffee cups and spoons disappeared like magic. This, too, in spite of the fact that the bulletin board in the main saloon bore these verses:

Moses, lawgiver for all time,
Wrote for the sons of men

"PRINCE UDINE"—FIRST SHIP TO LEAVE GENOA WITH STRANDED AMERICANS

THE "CRETIC"—THE FIRST SHIP TO LEAVE GENOA WITH BRITISH REFUGEES.

THE MIDLAND ADELPHI HOTEL, LIVERPOOL.

the Midland Adelphi Hotel, Liverpool.

A model code of moral laws.
The old Commandments, ten.
"Thou shalt not steal" seemed plain enough.
To this clear-minded seer;
Today we feel he should have said
"Thou shalt not souvenir."

We were sailing under "sealed orders" for England, but whether London, Southampton, Liverpool, or other port, none knew. Reaching Gibraltar, Liverpool was announced as the destination. Thereafter we stole along through the night, ports shrouded, deck lights out, and blankets hanging on the smoking-room windows. About noon each day a battle-ship appeared and telegraphed the course for the next twenty-four hours. No news, or next to none, was received, as the wireless was used only for admiralty purposes.

Among the British passengers were many whom I knew—rubber planters from the Malay States, a young Englishman connected with the Booth office in Para, the superintendent of public works in Barbados, and so on. A Boston Minot, one of the editors of the "Youths' Companion," organized the Free Masons aboard, some sixty in number, one-half of whom were English and the rest Americans, and a sort of informal lodge meeting was held daily, where we all became well acquainted.

By Spain and Portugal we ran and finally reached the mouth of the Mersey. Presumably it was defended by mines, for we

equally congested. Finally, at two in the morning, beds were found in a boarding house, and we slept the sleep of the "bust."

It looked as if real hardships were in sight, but the next morning I met by accident a rubber friend, who hurried to the Adelphi Hotel, one of the best in Europe, secured the rooms of some Americans who were leaving that day, brought around fifty pounds in English money, and did his best to make us comfortable. The next day, by special favor, the banks allowed me to draw all I needed on my letter of credit.

A brief look at English business convinced me that there was little doing in any line, so passage home was negotiated. So

crowded were the outgoing boats that Deck "D" on the old "Campania" was the best in sight, and I received it thankfully.

I was not the only rubber man caught by the war. I heard of numbers of them, and found that F. C. Hood was also quartered at the "Adelphi." He had been caught in Berlin, and with his wife and son journeyed to Norway, there taking ship to a port in Scotland. The Hoods also slept on deck, and arriving at the Scottish port were forbidden to land—army orders. Mr. Hood managed to get ashore, saw the chief of police, and arranged that in the event of the boat leaving that evening for Norway, they be arrested and taken to the police station for examination. This ingenious plan, however, was not necessary, for at the last moment the rule was waived and they came ashore.

With some time on my hands, I visited rubber stores, general stores, talked with manufacturers and filled up on information.

READING THE WAR NEWS—A COMMON SIGHT IN ENGLAND.

SOLDIERS DRILLING ON THE GOLF COURSE, ENGLAND.

were guided by wig-wags, on boats stationed at intervals, and we zig-zagged slowly along, and at seven in the evening made fast to the pier. A wait of two hours ensued for the discharge of the luggage. Once ashore, instead of the usual orderly British custom house, we found a mob of frantic passengers, harassed officials and incompetent porters. The war had taken baggage trucks and men, and upset all system. At eleven o'clock our baggage was cleared, loaded on taxis, and hotel hunting began. All of the large hotels were choked with Americans—so full that it was hard work to get anything to eat. The little commercial hotels, the temperance hotels, and the pensions were

VESSELS OF THIS SORT ARE MORE OFTEN SEEN THAN MERCHANTMEN.

Again and again the question was asked: "Where in America can I get this?" "What rubber manufacturers make that?" And I gave addresses by the score. The interest seemed chiefly to center about small specialties in hard rubber and grades of

garden hose, stoppers, etc., that had been aforetime purchased in Germany. Finally we embarked, and except for the bad air down on deck "D," were comfortable. As for dangers, there were none apparent, in spite of shrouded lights and top speed.

The tales of war experiences on the part of other travelers are many, and have been told and retold in the daily press.

THE CAMPANIA CROWDED WITH AMERICANS.

One thing was patent, however, and biased the judgment of all the { English } were mighty good to Americans and the re- { German } { French } cipients of courtesies believed that they would win.

SOME LIGHTS ON THE WAR.

THE editor of THE INDIA RUBBER WORLD talked with many in the trade during his recent stay in England. Some of the views are embodied in the following paragraphs:

The head of an English firm who sold supplies to rubber companies on the Continent, said:

"Two months ago I had an income of £30,000 a year. Today I am out of business. My factories are shut down and I cannot pay my clerks. Thousands and thousands of pounds owed me on the Continent are absolutely lost until the war is over, and no assurance of ability to pay even then.

"If I were young enough I should enlist to fight the Germans, or, rather, the German military idea. I know that at heart my many friends among the German manufacturers are not my country's enemies. This war was not of their seeking. It is a terrible setback for the rubber industry."

Another said: "I am running day and night shifts getting out truck and ambulance tires. Most of the good motor buses and motor trucks in England, as well as many motor cars, have been commandeered by the government. They took over all the stocks of tires that were in sight, English, French, German and American, but that was not half enough. So we are striving to make up the deficiency."

Still another said: "My best men have enlisted, but as orders are slack we get along running about half time. Hope the war is a short one; else we shall lose heavily."

Still another said: "We are busy, but are nevertheless helping our men to enlist. Numbers of us belong to a Trade Association, and we guarantee the following to men who are eligible for the army or navy:

"(1) A minimum of four weeks' full wages from the date of leaving; (2) re-engagement on return guaranteed; (3) half-pay during absence from duty for married men from date when full pay ceases; (4) special arrangements with single men who have relatives entirely dependent upon them; (5) after war, all Territorials to be given three weeks' holiday, provided that two weeks are spent in camp. The response has been quick and satisfactory, and already several hundreds have expressed their intention of enlisting, and the numbers are rapidly growing."

A young aviator who was for some time a rubber worker sent home the following from France, as an accurate summing up of the relative efficiency of French and German types of dirigibles:

"French airships have been doing excellent work, and have so far escaped unscathed, although often under fire. One of them, starting from Maubeuge, flew over Treves and beyond, returning safely to its shed. On the other hand, we have bagged several Zeppelins.

"The reason for this apparent invulnerability of the French airships is simple. By reason of the elasticity of our gasbags we can safely maintain a very high altitude, beyond ordinary gun range. This is impossible with the rigid shell of the Zeppelin, which cannot bear the expansion of gas, more particularly in this hot weather; so the French have a distinct advantage in airships."

The cancellation of German patents was thought a good move by most, but one cable manufacturer said:

"We own the British rights for an important German patent. Now I wonder if that will be cancelled. And if it is, what can we do about it? We paid thousands of pounds for it. I fancy there will be many such cases."

Regarding the cargoes of seized ships the Foreign Office publishes in the "Supplementary London Gazette" as full a list as may be. The Government is also soon to publish a list of those detained in Belgian, French and Japanese ports. Seized ships are brought before the regular prize courts, and those interested in the cargoes are represented by attorneys at these courts. If the goods are not contraband they are speedily released.

A British manufacturer wrote to the "London Times" this regarding the great Siemens Cable Works:

"According to Somerset House, the great and old-established firm of Siemens Brothers (Limited), of Woolwich, has a paid-up capital of £600,000 in 120,000 £5 shares, and of these 120,000 shares no fewer than 70,782 are held by members of the Von Siemens family in Berlin, the address being 'Verwaltungsgebäude Siemensstadt bei Berlin' (Administration Building, Siemenstown, near Berlin.). That is to say, Messrs. Siemens Brothers (Limited), of Woolwich, are absolutely controlled by the immense Siemens and Halske concern in Berlin. Out of 49,000 odd shares held in this country, about 39,000 belong to two gentlemen whose affiliations are certainly German. The 70,000 odd shares held in Berlin probably represent a steady drain of somewhere about £35,000 a year from this country to Germany from one firm alone, and without a solitary countervailing advantage.

"That is a sufficiently serious matter, but the interesting point to which I think public attention should be drawn is that it is stated in technical circles in London (with what truth I know not) that the British Government has given large orders for war material to Messrs. Siemens Brothers because the Government cannot help itself. It must have the war material, and the big British firms are working night and day on Government orders and can do no more. In other words, a considerable portion of the profits from British orders for war material to fight Germany will go to Germany to help Germany to fight us."

In the same issue appeared a list of other German-owned firms, among which were: The Continental Tyre and Rubber Co. (Great Britain), Limited, with a capital of £25,000, £24,000 of which is held in Germany;

The British Ceresit Waterproofing Co., Limited, capital £5,000, £4,950 held in Germany;

Calmon Asbestos and Rubber Works, Limited, £30,000, all held in Germany;

Armaduct Manufacturing Co., Limited, capital £6,651, £5,252 held in Germany.

Regarding debit and credit accounts between belligerents the managing director of Nicholson's Raincoat Co., Limited, offers the following:

"According to figures extracted from Whitaker, the imports from Germany to this country for the year 1913 were £70,000,000, and our exports to Germany £59,500,000; therefore we may assume that we are debtors to Germany on balance by about £10,500,000.

"Further, if we allow an average of two months for settlement of accounts, it would appear that one-sixth of the annual turnover of £130,000,000 is constantly owing. Therefore there is in suspension at the present time probably £21,000,000 debtor and creditor between Great Britain and Germany alone. By the proposed scheme this sum could be quickly liberated, to the immense benefit of commerce and industry in our own country.

"In the case of my firm, we are creditors to a considerable amount and if we could receive this sum from firms who are debtors, through the medium of a clearing-house, it would enable

us to provide further occupation for our 500 workpeople and thus help the nation generally."

In spite of the appeal on the part of American users, England has definitely stopped the export of aniline oil.

Prof. Atwood, of the American Association of Commerce, Berlin, known to many in the rubber trade, did good work in helping stranded Americans during the first of the war panic.

Some one played a mean trick on an Akron youth, employed in a British rubber factory. As he was about to start off on a vacation, he was ordered to appear at police headquarters, where information had been lodged that he was a German, and that he had not registered. In spite of his protestations he was ordered not to go more than five miles from the station, and his vacation trip became impossible.

Ernest E. Buckleton, president of the Northwestern Rubber Co., Limited, is doing a lot for the Red Cross, furnishing yarn for socks, material for bandages, and enthusiastically stirring up volunteer workers to prepare these materials.

The report that Germany had hundreds of tons of synthetic rubber and that domestic factories were using it in lieu of natural rubber and thus suffering no inconvenience is generally discredited in England.

Dr. Joseph Torrey, at Litherland, is editing the papers read at the last London Rubber Exhibition preparatory to issuing them in book form. He is greatly handicapped by the impossibility of securing corrected proofs from authors resident in France, Belgium and Germany.

EUROPEAN RUBBER NOTES UNDER WAR CONDITIONS.

During one of the battles near Muelhausen, Alsace, the villa of George Chatel, director of the Automobile and Aviation Co., of that city, was struck by a shell and Mr. Chatel and his wife both killed.

The Agricultural and Industrial Exhibition which was to have been held in Rovno, Russia, this fall, has of course been postponed. If the conditions warrant it, it will be held from August 28 to September 15, 1915.

The India Rubber, Gutta Percha and Telegraph Works Co., Ltd., of London, will pay half wages to the wives and families of all its employees who enlist in the service, and employment will be found for them on their return.

Owing to the important foreign contingent in Mincing Lane, many of its representatives have been called to arms by one or another of the belligerents. Among them is Mr. Robert Kahn, of Hecht, Levis & Kahn, who has been summoned to the French colors.

It is reported that M. Michelin, of Clermont-Ferrand (France), the tire manufacturer, has established a fund equaling \$200,000 for the benefit of French aviators who may perform acts of exceptional heroism during the war.

REDUCTION IN BRITISH RE-EXPORTS OF RUBBER.

The more immediate effect of the war upon the English rubber market is shown by the re-exports to other countries from England during the month of August of the years 1913 and 1914.

	1913.	1914.
Russia	1,286,200	63,200
Germany	1,602,500	652,500
France	876,200	467,900
United States	4,242,100	2,184,600
Other countries	1,010,600	474,300
Total	9,017,600	3,842,500

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

THE WORLD'S MERCHANT MARINE.

NOW that the opportunity has arisen for greatly increasing the merchant marine of the United States—a development which has been desirable for a great many years—it is interesting to glance at the present merchant marine of the leading countries of the globe, and to compare it with conditions a generation ago.

The world's merchant marine statistics issued not long ago by the French Registry Office gave the total number of steamers and sailing vessels forty years ago and at the present time, or, more accurately, just prior to the outbreak of hostilities, as follows:

1874-75 Sailing vessels, 59,280; with average of.....	14,521 tons
Steamers 5,365; " " "	3,424 "
1913-14 Sailing vessels 21,924; " " "	5,630 "
Steamers 17,135; " " "	23,841 "

The following statement is given of the mercantile marines just prior to the war, of England, Germany, France and the United States, in the two classes:

	Sailing vessels, 1914.	Steamers, 1914.
England	4,945	6,594
Germany	1,041	1,510
France	877	612
United States	2,993	1,103

STATISTICS OF STEAMERS.

Figures of the number of mercantile steamers belonging to 16 nations, early this year, were as follows:

	Steamers, 1910.	Steamers, 1914.
England	5,453	6,594
Germany	900	1,510
United States	551	1,103
France	526	692
Norway	657	1,266
Japan	332	803
Italy	258	537
Holland	224	451
Sweden	497	940
Austria	167	315
Russia	435	622
Spain	377	438
Greece	108	312
Denmark	318	470
Belgium	73	132
Various countries	580	890

Thus while England had 6,594 mercantile steamers, Germany had 1,510, France 692, Russia 622, Italy 537 and Austria 315.

THE WAR AND THE ENGLISH RUBBER INDUSTRY.

According to English advices, the ordinary cotton goods trade has been at a standstill, while the demands for government purposes have been of an unprecedented character. This applies specially to goods for hospital purposes.

The rubber industry in general has important orders for the various government departments affected by the war. These include equipment for the motor trucks and commercial vehicles now being ordered largely to replace the horse-drawn vehicles taken for military purposes. Permanent benefit is expected to the rubber trade from the impetus thus given to the motor for commercial purposes. Among the government contracts which have been received is one placed with the Dunlop company for 10,000 pneumatic tires. The Midland Rubber Co., which had been supplying the government's requirements in solid tires for army transports, has had a marked increase of that business. Orders have also been received from the government for miscellaneous rubber products.

The Foreign Trade of the Belligerent Countries.

ONE of the questions naturally suggested at the outbreak of hostilities in Europe has been the effect, immediate and more remote, on the foreign trade of the countries involved. The foreign trade of Germany, of course, for the time being is non-existent, and the commerce of England, France, Austria and Russia is naturally very much reduced. But the particular feature of this situation that interests American manufacturers is to discover if possible how much of this international trade hitherto enjoyed by these different countries can be secured for the United States and how much of this new business will remain permanently in this country after the restoration of peace.

The first step in the discussion of this matter is to review the character and extent of the imports and exports of the European countries particularly concerned. With that in view tables have been prepared, which are given below, showing briefly the entire volume of imports and exports of England, France, Germany, Belgium and Austria, and more particularly the exports of rubber manufactured goods from the first three.

TOTAL COMMERCE OF THE BELLIGERENT NATIONS.

THE table below gives the total imports and exports of the various countries now at war, including merchandise of every kind. The values are given in United States currency.

	Imports.	Exports.
Great Britain, 1913.....	\$3,845,169,795	\$3,175,585,670
France, 1913	1,700,000,000	1,260,000,000
Germany, 1913	2,673,750,000	2,478,150,000
Austria, 1911	667,000,000	516,200,000
Belgium, 1911	870,135,289	691,007,450
Servia, 1911	22,277,105	22,564,856
Russia, 1911	526,690,500	770,555,500

United States, 1913-14 (for comparison): Imports, \$1,893,925,657; exports, \$2,364,579,148.

ENGLISH EXPORTS OF WATERPROOFED GARMENTS.

For the First Six Months of 1913 and 1914.

The value are given in currency of the United States, taking the present exchange basis of a pound, viz., \$5.

To—	1913.	1914.
France	\$37,425	\$49,585
British South Africa.....	65,565	62,995
British East Indies	104,985	118,785
Australia	109,130	146,465
New Zealand	180,115	78,480
Canada	873,235	629,725
Other countries	1,306,487	1,342,540
Total	\$2,676,942	\$2,428,575

ENGLISH EXPORTS OF RUBBER FOOTWEAR.

To various countries not specified. For first six months of this and last year.

	1913		1914	
	Pairs.	Value	Pairs	Value.
British manufacture	620,808	\$275,660	653,268	\$307,685
Foreign and Colonial manu- facture	38,424	30,790	26,616	11,190

ENGLISH EXPORTS OF RUBBER TIRES.

To various countries not specified. For first six months of this and last year.

	1913.	1914.
Rubber tires and tubes, British manufacture.....	\$1,979,925	\$1,493,260
Foreign and Colonial manufactures.....	8,460	8,580

ENGLISH EXPORTS OF OTHER RUBBER MANUFACTURES.

To various countries not specified. For first six months of this and last year.

	1913.	1914.
Rubber manufactures (except waterproofed apparel, footwear and tires), British manufacture	\$4,264,310	\$3,771,925

FRENCH EXPORTS OF RUBBER GOODS FOR 1913.

	Tons.	Value.
Elastic fabric	143	\$587,200
Elastic piece goods.....	35	90,600
Belting, hose, valves, etc., of rubber, whether or not combined with other materials.....	1,509	2,935,000
Card clothing	33½	7,800
Rubber clothing	83¾	384,200
Rubber footwear	65	100,400
Tires, covers, etc., for vehicle wheels.....	4,993	17,826,000
Asbestos manufactures, spun, woven, or molded	2,570	1,218,400

GERMAN EXPORTS OF RUBBER AND ALLIED MANUFACTURES.

THIS table, based on the latest available statistics, shows the annual value of the exports from Germany of crude rubber, rubber manufactured goods, accessory materials and articles with which rubber is closely associated. It shows also the countries to which these exports went.

GERMAN VIEWS OF THE WAR.

German reports indicate that the rubber factories producing goods for the army have been very busy in some departments, such as sanitary and hospital supplies, bicycle and automobile tires, and the accessories of aviation. This occupation will, however, it is considered, hardly offset the loss of regular business in other departments.

The most important German rubber works are provided with a supply of crude rubber for the next few months. As, however, the military authorities have seized all the available benzine, benzole, etc., there is a dearth of solvents.

A German rubber expert thus expresses his opinion as to the situation:

"The success achieved so far by our arms leads us to hope for the early conclusion of peace. It is in that case not to be doubted that our industry will again be busily occupied, and that it will succeed in making up for the severe losses caused by the war, besides making a progressive development.

Although in a more favorable position than that occupied by fancy goods, toys and industries dependent on fashion, the manufacture of rubber goods was much affected by the outbreak of the war. The lack of skilled workmen, drafted for the war, has been severely felt."

GERMAN EXPORT PROHIBITIONS.

According to German official proclamations of August 27 and 31, explanatory of previous notices, the following articles are subject to prohibition of export and transit commerce:—surgical wadding and gauze, rubber for goods for drainage tubes, bandages, etc., as well as surgical instruments and appliances. Asbestos, graphite, rubber waste and cleaning wool are likewise included in the export prohibition.

BRAZIL AND THE WAR.

By our foreign correspondents.

EVENTS have passed in rapid times. Within ten days of the declaration of war the "Revista" of the Amazonas Commercial Association at Manaus published a liberal discussion of the question, while ten days later, the Pará Commercial Association at a special meeting, considered the effect of the war.

The "Revista" stated that it was as yet impossible to foresee what other nations would be drawn into the conflict, nor to predict its duration and probable effects. It was added that Amazonas would suffer from the disturbance of the world's financial centers and from the derangement of navigation, upon which it relied for the distribution of its products, being dependent on the outside world as to imports and exports to a greater extent than any other Brazilian State.

Among the earlier acts of the association was to oppose the arbitrary rise in the prices of food-stuffs, on which subject assurances were received from retailers and distributors that it was only contemplated to make such advances as were absolutely necessitated by the increased cost of provisions and the fluctuations of exchange.

Under these circumstances the "Revista" urged the taking up of other products instead of limiting the activity of the State to rubber, as had been the case for nearly half a century. Amazonas now had an opportunity of realizing a fair price for its rubber in view of the conditions of the markets of consumption.

As previously announced, the meeting of the Pará Commercial Association was held on August 19 at its new quarters, being composed of landlords and rubber merchants. The chair was occupied by Senhor Rebello, Jr., president of the association, who explained that the object of the meeting was to find ways of meeting the present crisis. Two courses were presented: That of the State government, which proposed through the intervention of a bank to buy the rubber coming on the market and to ship it to America; or the plan of J. Marques that his firm should act as intermediary for all the consignments of the article, shipping it to America on account of the different owners. It would receive 8 per cent. with one per cent. commission. The firm of J. Marques would advance 80 per cent. of the market value to the owners of the rubber.

After the two proposals had been read to the meeting Senhor Rebello commented on them. He expressed disapproval of that submitted by the government of the State and favored that of J. Marques, stating his cooperation with a view to its acceptance.

MORANTZ'S LAW.

The principal clauses of the "Morantzum" law, enacted on August 1, by the National Congress provided for the granting of a maximum extension of payments, ranging from 30 to 120 days, of obligations resulting from bills of exchange, promissory notes, and drafts for their non-payment, and it subjected exporters to a 10 per cent. tax.

AMAZONAS RESERVISTS RETURN HOME.

Senhor Rebello explained that his return to Manaus was due to the fact that it was his duty to return to his home, and that he was not able to continue his efforts. Rates for the voyage from Manaus to Belém were 100 reis for the war.

NINE BRAZILIAN VESSELS.

Mr. Morgan, in a speech before the Chamber of Deputies, stated that the Brazilian government had declared its neutrality and will maintain it, and that it was not possible for the Brazilian government to send vessels to the war.

THE RUBBER COUNTRY.

The rubber country is a vast area, covering the entire Amazon basin, and is the source of the rubber supply for the world. The principal

countries containing a German population are: United States, 2,000,000; Russia, 1,800,000; Brazil, 400,000; France, 500,000; Canada, 300,000; England, 100,000.

The "Folha do Norte" of Pará, lately wrote: "We Brazilians owe the Germans perhaps more than we do any other nation. We are, however, not Germans, nor French, nor Russians, but above all Brazilians. Being in many cases descended from Germans, we have to treat our progenitors with respect, while maintaining complete neutrality in this European struggle."

NEUTRALITY OF BRAZIL.

In the early days of August the Brazilian Government issued a decree asserting the neutrality of that country during the present struggle. This attitude has been strictly observed by the press and in official circles. The movements of the reservists in following the calls of their respective countries have been in no way impeded by the federal authorities.

PAOLO CORDELLIER GONE TO THE FRENCH ARMY.

M. Paolo Cordelier, local representative for the rubber firm of De Lagotellerie & Co., has left Pará for Europe to join the French colors. A substitute was transferred from Manaus to take his place.

INTERRUPTIONS OF STEAM COMMUNICATION.

At an early date during the hostilities the Lloyd Brasileiro issued a notification that during the war there would only be three departures on the monthly Northern service, the steamers leaving Rio on the 10th, 20th and 30th of each month.

The Northern and Eastern services of the Booth line were suspended until August 6, when orders were received by wire to resume sailings, both for America and Europe.

BRAZILIAN COAL.

In view of the prohibition of English coal exports, attention has been given in Brazil to the geological studies made in the United States and Germany of Brazilian coal, with a view to its utilization in the natural state or as briquets. An analysis shows: Ashes, 35 per cent.; sulphur, 3 to 5 per cent., and moisture, 5 to 11 per cent.; the remainder being composed of carbon and volatile substances.

RUBBER STOCKS IN PARÁ.

Statistics to July 31 showed the following situation:

June 30 stock	2,012
July receipts	1,370
July shipments, Para to America	3,382
July shipments, Para to Europe	1,203
July shipments, Para to Europe	800
	2,102

Stock July 31 1,280

This quantity was composed of 250 tons in first hands and 1,024 tons in second hands. The latter quantity included 798 tons in the hands of the Bank of Brazil, and 70 tons each with Messrs. Zarges and J. Marques. The remainder was in the hands of smaller holders.

Para receipts from August 1 to August 20 were 615 tons (560 rubber and 49 caucho). This total shows a comparative decrease from that of the entire month of July of 1,370 tons.

BRAZILIAN VESSELS FOR TRADE INTERCHANGE.

Ambassador Edwin V. Morgan cables from Rio de Janeiro to the Bureau of Foreign and Domestic Commerce at Washington that the Minister of Finance of Brazil is arranging to dispatch to the United States five vessels of the Brazilian Lloyd with consignments of coffee from Santos and Rio de Janeiro, and rubber from Pará, which are returning back cargoes of prime necessities.

The writer, in an opinion on South American rubber—"The Rubber Country of the Amazon," by Henry C. Pearson.

Rubber Aboard the Fighting Fleet.

THE rubber markets are generally sorely taxed but to long to meet the needs of the battling navies of the world and to make up the losses incurred to warfare all at. The public at large does not know it, but this material of nature's providing plays a large part in making the man-of-war the efficient fighting machine it is today. Indeed, if one were to reduce its varied uses to a question of pounds, every first-class dreadnought would show its indebtedness to the measure of many tons.

The more formidable India rubber serves to make the battle-craft the further that vessel goes toward maintaining peace on, when that becomes impossible. England with her fleet has made it reasonably safe for her merchant craft to maintain their trade routes with but little fear of hostile interference, and it is

when an extensive subdiaphragm being constructed to divide a number of narrow areas of moderate spaces. It is constructed in an inner bottom, and the internal spaces are divided into small compartments and each made airtight, so as to

susceptible of inspection. This inspection is necessary in order that the steel spaces are not rusted away by the paint and corrode the plates to dangerous thickness. Hence the need of rubber in these subdivisions, and to a great extent a watertight closure is, however, made watertight by employing gaskets or collars of the best rubber in packing system. On a larger scale, the ship is partitioned off by bulkheads of steel, and in order

to facilitate inter-communication between these active centers for in these spaces are placed engines and boilers and auxiliaries in different compartments or their own, there are

CRUISERS WHICH HAVE LED THE WORK IN WATER-PROOFING ON SHIPBOARD.

CRUISERS AND DREADNIGHTS.

ONE OF THE LARGEST DREADNIGHTS.

doubtful if her dreadnoughts and her battle-cruisers could do this without the helpful service of rubber in manifold directions.

The modern man-of-war is a gigantic steel hove-mill, the

sliding or swinging doors, the closing of which, when closed, should be absolutely watertight. They would not be watertight, in fact, without the aid of rubber.

but for the rubber used. In these two directions alone, not to mention others, the safety of a ship in time of accident mainly depends, for a leaky manhole or an insecure door might easily lead to grave consequences if not to the loss of the craft itself.

But a ship that can keep the sea in all kinds of weather, either

no less than the amount required must be used to meet this gauge of efficiency. Piston rods and valve stems must not exude an excess, and here is where rubber packing saves the day. The coal and water problem is a still nicer one. Salt water is not used in marine boilers. The ship starts upon her voyage with

her boilers charged with fresh water and with a reserve supply in suitable tanks or in the double bottom spaces. When more is needed, it is obtained by distilling the sea water. Distilling sea water calls for heat in the form of steam, and the steam is produced by the coal or the oil fuel, as the case may be. It is surprising what a leaky joint in a hot water pipe or a small escapement in a steam feed or a stuffing box will represent in the way of waste in the course of twenty-four hours. Therefore, only the best of rubber packing will answer.

Of course, many of the decks not exposed to the weather are covered with rubber tiling and rubber mats at the foot of ladders and the approaches to heavy steel doors are a necessity, likewise so are the treads on gangways covered to prevent slip-

HOW THE UNITED STATES NAVY LAYS NAVAL DEFENSE MINES.

guarding the paths of commerce or pursuing the foe, must be something more than merely secure below decks. It is quite impossible for her to drive along into heavy seas and to have her decks smothered with the great tumbling masses of water unless her hatches and her sky lights as well as portholes be proof against the sea's invasion. Here, once more, rubber packing and rubber seatings meet the emergency and make it possible to close these openings perfectly. But there must be communication at many points beneath the waterline between the sea and the interior of a man-o'-war. Some of these openings are for the purpose of flooding compartments in case of fire,

others are passages by which the sea water can be drawn into the ship for a variety of services. In every case, however, a suitable valve stands sentinel between the breach and the inner vitals of the craft, and that these valves may be tight when closed, rubber packing is employed. Indeed, one might go on interminably and enumerate these necessary but not spectacular services of india rubber, but enough has been said to show how the fundamental fitness of the ship as a structure hinges in certain essential particulars upon the part played by this valuable material in the humble form of mere packing.

When it comes to the activities of the craft, such, for instance, as the motive machinery, then rubber packing of a different sort is demanded. The modern dreadnought carries steam at a higher pressure than that generated by the boiler, and a tremendous amount of scorching energy has to be held within bounds at every joint, stuffing-box, etc. A premium is paid to the engineering force in our men-o'-war which keeps its consumption of coal and water and oil below a certain standard or maximum. Oil is sent into the machinery for lubrication under pressure and no more and

ping as the fighting men hasten up and down upon their various missions. Rubber stops keep doors from banging, and similar buffers check the blows of the innumerable ponderous masses that swing and move in their different services on shipboard. Naturally, there are miles of rubber hose for cleaning decks and for battling with fire, and Jacky must have his rubber boots as well as his rubber clothes in order that he can stand watch when the storm blows and the stinging spray sweeps the ship from stem to stern. Down in the sick bay and the dispensary the surgeon has his rubber bandages, and vulcanized rubber utensils of many sorts, not to mention rubber tubing and the insulations

A FLOTILLA OF ITALIAN SERRAMARINES.

of his X-ray equipment. Indeed, rubber is just as much present there as it is in the operating room of a large hospital, for the ship's surgeons have a crew of more than a thousand to minister to in the biggest of up-to-date dreadnoughts. There are scores upon scores of lesser directions in which rubber is alone ade-

quate on a fighting ship, but these cannot all be detailed here.

In the strictly fighting end of the naval vessel, rubber meets the needs as nothing else will, and the wonderful precision of the modern naval artillery is very largely due to the aid rendered by this material. The gun pointer, or rather the gun pointers, for there are two of them for each big gun, are the men that

MAKING THE RUBBER CAPPED "EYE" FOR THE GUN POINTER.

keep the muzzles of the weapons pointing steadily at the target anywhere from 10,000 to 16,000 yards away. No matter how their ship may roll, it is their duty to swing the rifle to right or left or up and down—one man controlling the horizontal movement while the other controls the vertical—holding it always straight at the object far away. To do this, these pointers must hold their eyes pressed against a telescopic sight, holding them there even when the gun is fired and the sight jarred by the shock of the explosion. But for the cushion of soft rubber the men's brows would be cut to the bone and their expert usefulness destroyed in a few moments. Again, the small, rapid-fire guns, those spit-fires that are designed to destroy submarines and to keep other torpedo craft at bay, have a habit of jarring their pointers in recoil something after the fashion of a kicking mule. No human shoulder could stand this pounding but for the intervening pad or tubular buffer of rubber provided.

The latest mechanical device designed to help the man behind the gun is a telescope that "floats" horizontally, no matter how the ship may pitch and roll, because it is mounted upon a small stabilizing gyroscope. This mechanism is placed in the so-called "spotter tops" of the military masts, where crouch the men who watch the splash of the range-finding shots and telephone below how much "over" or "short" the gunners have estimated the distance. The spotters trace the fall of the projectiles through these telescopes, even though the mast tops are sweeping through wide arcs like agitated whips. The stabilizing gyroscopes that make this service possible are driven by wee electric motors, and only the perfect insulation of rubber makes their performance possible. This brings us to other uses of the gyroscope on ship-board and, incidentally, to the employment of rubber insulation. The gyroscopic compass is rapidly displacing the old magnetic compass aboard men-o'-war, and the gyroscope is now employed to record at various places in a ship diagrammatically the way

the craft is turning in relation to a fixed point which cannot be seen but toward which the men of the torpedo tubes must set their weapons ready for launching. But the most startling use of the gyro is for stabilizing a vessel so that she will roll but little even when the sea is very rough. One of our illustrations shows one of two gyros fitted to the United States torpedo boat "Worden," and the manner in which they performed has blazed the way for their use on battleships. Apart from insulating the electrical connections, rubber also serves to make air-tight the casings in which the gyros are spun in a partial vacuum.

We have heard much about the submarine mine and the torpedo of late, but it is highly probable that many do not know the ways in which rubber makes these weapons of destruction the sinister instruments they are. In the automobile torpedo rubber packing is extensively used and necessary, but it is not of that we want most to speak. The torpedo would not fulfil its mission properly if it could not run at a uniform depth below the surface of the sea—that depth being far enough down to get below the protecting belt of armor and to hit a ship where she is least able to withstand such a blow. The depth-regulating device consists fundamentally of a diaphragm of soft rubber directly exposed to the pressure of the sea water on the outside and to the thrust of a spring on the inside, all the while keeping the water from getting into the body of the torpedo and thus altering its nicely adjusted buoyancy. The pulsing of this rubber diaphragm is the means by which the rudders controlling submergence are operated. In the submarine mine, the prime service of rubber is one of insulation, but there are forms of these weapons that are likewise held at a predetermined depth through the action of a rubber diaphragm akin to that in the torpedo except that the actual buoyancy of the mine is juggled. Of course, we are speaking of naval mines and not military mines which are operated from a shore station.

As must be recognized, every fighting ship today has a wide and varied electrical installation, and none of this service would

ONE OF THE BIG STABILIZING AND ROCKING GYROS. THE SPINNING WHEEL IS INSIDE OF THE CYLINDRICAL CASING. NORMALLY IT ROTATES IN A FORE-AND-AFT PLANE, BUT WHEN TURNED FROM SIDE TO SIDE IT EXERTS A PUSH LIKE THE SHIFTING OF TONS OF WEIGHT UPON THE DECK OF A VESSEL.

be possible but for rubber in one form or another, and the United States Government, as do most other maritime nations, imposes a very high standard for all of these preparations. The submarine is entirely electrical in its propulsion when submerged, and only the very best of insulation is permissible, for a chance spark through any defect would be pretty certain to invite disaster if not destruction. So, too, the hull must be kept perfectly watertight and all hatches must be so fashioned that their covers can be screwed tight against seatings of the best of soft rubber packing. A leak of sea water might be quite as dangerous as a short circuit, because if that water found its way into the storage batteries it would lead to the generation of that insidiously suffocating chlorine gas which has already asphyxiated more than one submarine crew.

No up-to-date ship of war is complete without her wireless outfit, and the readers of THE INDIA RUBBER WORLD know already

DIVING OUTFIT.

how much rubber helps to make this wizardry of the air possible; and just as messages go and come through the atmospheric ocean so, too, knowledge of what is happening in the depths is sometimes quite as necessary to the warship. If the craft be injured below water, if there be some doubt as to the structural condition of her bottom, or if an anchor be fouled or lost, then a man must be sent overboard for inspection or for search. Here is where the naval diver fulfils his mission, and here, likewise, is where rubber makes his important work possible.

WHERE DID THEY COME FROM?

TO THE EDITOR OF THE INDIA RUBBER WORLD, DEAR SIR:

A New York newspaper man passing an establishment which combined the functions of a retail hardware store and a junk shop saw a window full of queer looking objects and carrying that illuminating placard: "Do you know what they are? We don't, but we have a lot of them and are going to sell them at a quarter each if we can find anybody fool enough to buy them." The newspaper man did not fit the description of the desired customer, but the mystery weighed upon him until good fortune brought him to the fount of knowledge which overflows in the pages of THE INDIA RUBBER WORLD. He saw a picture and from that moment he knew more than the junkman. It was an india rubber tapping knife.

"HENDERSON RUBBER."

FOR years the object of a certain group of chemists has been the manufacture of a synthetic rubber. The methods of approaching this subject vary greatly, but the ultimate object has always been a chemical compound having all the characteristics and the same chemical composition as true rubber. What is known as "Henderson Rubber" is an entirely new product; it is not a synthetic rubber nor is it a rubber substitute.

Its basis is raw hide scrap. This as it comes from the dealer is very hard and tough and difficult to cut or work with ordinary tools. The scrap is first treated to remove all impurities, and is then given a further chemical treatment which partly breaks down the hide. This reaction is accompanied by a change of the relation of the atoms in the molecule and what appears to be a colloidal arrangement is set up. The material is then in a very unstable condition and must undergo further treatment which results in a product of great stability. The treatment not only preserves and stabilizes the substance but also has an effect in the finished product on its affinity for true rubber. The product is then cleaned, masticated and sheeted out and is ready for the market.

It has the appearance and many of the characteristics of light plantation crêpe. It is tough, very nearly as elastic, and may be worked in the same way. Used in rubber mixings it is said to increase tensile strength and resiliency. It is used in the same manner as rubber, except that a certain percentage of rubber should be present in soft goods if the product is to be vulcanized.

Henderson Rubber, it is claimed, resists oxidation and keeps down deterioration, thereby increasing the life of the article. When used with reclaimed rubbers of all grades it is said to improve their quality very materially and also to have the faculty of taking up a large percentage of minerals.

Its uses, so the manufacturers assert, are as varied as those of rubber and it may be used to advantage wherever rubber is used, either in soft or hard goods. It is on the market and is being used in molded goods, frictions and surfaces for belting, auto-casings and tubes, hard rubber and ebonite goods.

RUBBER DISC SHOCK ABSORBER.

The majority of the automobile shock absorbers that have been placed on the market in the past operate either by means of steel spring resistance or by the friction of steel discs. However, here

THE SHOCK ABSORBER WITH THE RUBBER DISCS.

is a newer type of shock preventer which takes up the shock of the road by virtue of the graduated resistance of a series of rubber discs. The illustration shows one of these devices set above the spring between the axle and the frame of the car, to control the action of the spring as it moves up and down. The device comprises a series of inclined planes of high carbon steel working against discs of brass on the principle of the wedge. As these wedge-like discs operate, they expand and contract other discs of rubber. This rubber cushion rapidly increases in resistance the farther it is compressed, so that a heavy shock meets with a corresponding resistance while a light shock encounters small resistance.

What the Rubber Chemists Are Doing.

SOME AMERICAN WORK ON SYNTHETIC RUBBER.

IN the "Journal of the American Chemical Society" (April, 1914), L. P. Kyriatides describes some highly technical work which is of interest to the rubber industry, as it indicates a possible method of making synthetic rubber, and were it not for the high cost of the raw materials used and the complicated and costly process of manufacture it might be of commercial value.

The first article is entitled "Observations on some Barbier Grignard Reactions." The reaction relates to the action of ethyl-magnesium bromide on various substances and in this case chlor-acetone was the substance acted upon. This reaction produces oxides. The author has improved the original method by substituting ethyl-chloride for the ethyl-bromide which was used in the original Barbier Grignard process, being acted upon by metallic magnesium in the cold in ethereal solution. The author claims that by substituting the ethyl-chloride excellent results were obtained.

The product of the reaction was methyl-butylene-oxide. In the following article, entitled "New Process for the Preparation of Unsaturated Hydrocarbons with Conjugated Double Bonds," it is revealed that these are attempts to make synthetic rubber, as the "conjugated double bonds" are the necessary characteristic of all the proposed raw materials.

The sub-head of this latter article is "Pyrogenetic Decomposition of Oxides." A number of experiments was tried, but the successful one was the dehydration of methyl-butylene oxide made by the previous process by distillation through kaolin heated to 450. The reaction was carried on in a vacuum with an absolute pressure of less than 1 mm. The hydrocarbon (isoprene) showed a constant B. P. of 35-36. This liquid was treated with a coil of sodium wire and thus polymerized according to Harries' directions. A tough product was obtained which vulcanized to a product resembling leather more than rubber.

This seems to be about the only work done on synthetic rubber in America. At least it is the only work the results of which have been given to the public and, taken in connection with Patent No. 1,106,290 of August 4, 1914, and previous patents No. 1,094,317, 1,094,223, 1,093,922 and 1,093,923, which were granted to L. P. Kyriatides and R. B. Earle, and assigned in each case to the Hood Rubber Co., it shows at least some attempts by Americans to make some progress in a line which has been heretofore monopolized by Europe.

PROPERTIES OF RUBBER SOLUTIONS.

W. A. Caspari has been doing extensive experimental work on the osmotic properties and physical constants of caoutchouc solutions. This is published at length in the "Journal of Chemical Society" (London) for August, 1914, pp. 2141-2150.

He states that while the osmotic pressures exerted against a semi-permeable diaphragm by various colloids in aqueous solution have been frequently determined, their real significance is a matter of some doubt, owing particularly to the usual presence of some small amount of foreign electrolytes. But when the solvent is non-ionizable matters are simplified and extremely viscid solutions like caoutchouc may show peculiarities of their own.

Osmotic pressure measurements are usually for the purpose of determining the molecular weight, but are more reliable when the solutions approach the character of crystalloids. The cryoscopic and ebulliscopic methods usually fail to measure osmotic quantities of colloids, but by direct measurement of the pressure inside a semi-permeable septum greater delicacy is obtained.

The following figures were obtained with fresh caoutchouc in benzene:

Percentage in Solution	Pressure M. M.	Atmospheres	Viscosity
5.26	45 (Hg.)	.059
3.59	360	.030
2.95	251	.021
2.10	137	.011	3.196"
1.48	77	.006	989"
1.01	42	.003	374"

Here it will be seen the osmotic rise increases faster than the concentration. The viscosity was determined by the flow through the capillary tube of the Ostwald viscosimeter. On deviscifying the caoutchouc by boiling the solution for 80 hours the following figures were obtained:

Percentage in Solution	Pressure M. M.	Atmospheres	Viscosity
9.95	37 (Hg.)	.048	287"
6.89	330	.028	150"
4.11	165	.014	68"
2.06	71	.006	35"

In both cases the osmotic rise seems to depend on physical condition rather than the concentration. To prove this viscous solutions were put on one side, the osmometers and the deviscified solutions of same strength on the other. Also, the depression of freezing point in benzene solution is so small as to be of little value.

In experimenting the author used benzol and gasoline (boiling point 80°-120°) for the permeable diaphragm. Cylindrical cells of white porous earthenware were found suitable; for their solution the cell pores were blocked with cold vulcanized caoutchouc. This was done by soaking them in 10 per cent. solution of deviscified caoutchouc, placing them under a vacuum to remove air. Then after a few hours' more soaking they were immersed in sulphur chloride to cure.

The osmometer was of glass, consisting of a widened part with stopper like the top of a bottle cemented into the earthenware cell, and a manometer tube came out the side of the glass top. This whole arrangement was lowered into a wide cylinder containing the outer solvent. Deresinified plantation rubber was used containing about 3 per cent. nitrogenous and mineral matter.

The more viscous solutions invariably showed an osmotic rise against the less viscous. Similar experiments were made with gutta percha. Considerable speculation is indulged in in accounting for the results obtained, but it appears that the final conclusions were that a convergence of the molecular weight values of caoutchouc towards 100,000 is indicated and gutta percha is shown as 40,000, which is considerably smaller.

SWELLING OF VULCANIZED CAOUTCHOUC.

F. Kirchof (Kolloidchem Beih., 1914, 6, pp. 1-22. Also in the Jour. Chem. Soc., August, 1914, page 633) has examined the swelling of vulcanized rubber by measuring the increase in weight of thin discs of Pará after immersion in benzene, carbon tetrachloride, carbon bi-sulphide and benzine (naphtha of .74 sp. gr.).

The results show that the maximum swelling of caoutchouc decreases as the vulcanization increases. The maximum swelling was attained in 24 hours. The specific influence of each liquid runs parallel with the solvent power. The swelling velocity increases slowly with the rise of temperature. The relation between the extensibility and the vulcanization coefficient is similar to that existing between the swelling capacity and the degree of vulcanization.

THE VISCOSITY OF RUBBER SOLUTIONS.

D. Spence and G. D. Kratz (*Kolloid Zeit.*), 1914, p. 262, have shown that the viscosity of a rubber solution may be lowered to almost that of the solvent, and then the insoluble nitrogenous portion may be easily separated. Sunlight and heat assist in reducing viscosity. One hundred grains of washed and dried rubber were treated with 1S. of benzine containing 0.3 to 0.5 per cent. of tri-chloro-acetic acid and warmed. After 48 hours with occasional shaking it was settled, decanted, washed with the solvent, then with pure benzine, then dried and extracted with benzol, washed with alcohol and dried.

In four samples plantation rubber gave nitrogen as follows: 9.83 per cent., 10.90 per cent., 11.58 per cent. and 12.08 per cent. It is soluble in 1 per cent. Na.O.H. and precipitates with dilute acid. It agrees in nitrogen contents and reactions with the glucoproteins.

Hard cure Pará gave 7.75 per cent., 9.6 per cent. and 10.3 per cent. nitrogen. The insoluble constituent of balata contained 5 per cent. N. and specimens of proteins from *Funtumia elastica* showed N. 9.5 per cent. and 11.5 per cent. These results establish the fact that the nitrogenous constituent of rubber is a complex of protein and carbo-hydrate—probably a gluco-protein. The proper factor for nitrogen is probably 10 instead of the usual 6.25.

Clayton Beadle and H. P. Stevens seem to have carried out an extensive series of tests on viscosity of Pará rubber and at the same time tested vulcanized samples of the same rubbers. They have contributed a rather voluminous article in the "Chemical World" (London) of August, 1914, but a large part of it is devoted to comments on previous work of themselves and other authors, and no detailed figures are given to show just what their results were.

THE UNION OF SULPHUR WITH RUBBER.

Mr. F. Ahrens, in "Gummi-Zeitung," No. 28, p. 490, makes a contribution to the vulcanization of rubber in which he points out that rubber does not add sulphur in the ordinary conception as charcoal does in the case of dyes, gases, etc. He thinks that blooming shows the presence of a "solution product" and a "reaction product." The relation of the two changes continually until equilibrium is reached, the chemically combined sulphur increasing and the free or dissolved sulphur diminishing in amount. He claims the phenomenon of reversed action is frequently noticed in vulcanized goods. As an example he cites the analysis made of two identical samples, one analyzed directly after making and the other analyzed after aging several months. The rubber used was low grade. In the fresh sample the total sulphur was 15.80 per cent., acetone soluble sulphur 7 per cent. and combined sulphur 5.9. In the old sample the total sulphur was 13.60 per cent., the acetone soluble sulphur 9 per cent. and the combined sulphur 2.83 per cent. This seems a remarkable change in composition and one not often observed. The author thinks that the old sample has eliminated the sulphur as H_2S . The decrease in combined S. tends to the conclusion that this is less firmly bound in the old sample. Pará is said to show much less variation, and it is concluded that the particular nature of the Colloid requires the S. to be present in something more than the mechanically dissolved state.

The Industrial Chemical Co. with executive offices at 200 Fifth avenue, has recently erected a new plant with a capacity double that of the old one. This company makes "Alba Whiting" a specially prepared rubber white, so well adapted for rubber compounding use that this department of the business has increased 100 per cent. within the past two years. It is claimed to be economical both in cost and continuous use. This company also makes an excellent grade of rubber black.

SUBSTITUTE FOR RUBBER AND GUTTA PERCHA.

THE increasing use of both india rubber and gutta percha has turned the attention of industrial chemists to the production of substitutes therefor; and among these is a series which has been brought out by Dr. Zuhl and Herr Zimmermann, of Berlin. The intention is, of course, to produce a substitute for the two flexible vegetable substances, which shall have the same chemical and physical properties and be equally valuable for insulating against electricity. It is based on the fact that Chinese wood oil, which, as is well known, when heated at high temperatures is transformed into a mass resembling caoutchouc, can also be similarly changed when treated with chloride of sulphur. If the wood oil in question is mixed with resin or resinous substances, as for instance pitch, asphalt, or the like, and then subjected to the action of chloride of sulphur, there will be produced a substance which may be employed in the same manner as india rubber or gutta percha. It is desirable to heat the mass thus obtained to about 160 degrees C., after mixing it with a certain percentage of sulphur.

If it be desired to make artificial gutta percha, pitch, asphalt or similar substance—better still, paraffin wax—should be added to the resin before these are added to the wood oil and heated. Or the oil may also be treated with the sulphur chloride, and then the pitch, resin, etc., added. A less convenient method, but which also leads to good results, is said to consist in heating the mixture of resin, pitch or the like, with the wood oil to 200 degrees or 300 degrees C. for a long time, and then vulcanizing.

The proportions given in the German patent papers (No. 119,635) are as follows:

For making gutta percha: Two kilograms of paraffin wax are melted with 6 of pitch, $2\frac{1}{2}$ of wood oil added, and the mass stirred until thoroughly homogeneous. Then 1.1 kilograms of sulphur chloride are added slowly and well stirred; next, about 100 grams of fine pulverized sulphur, and the mass is then heated about one hour to 160 degrees C.

For making india rubber, 2 kilograms of pitch are mixed with 1 kilogram of wood oil and heated under pressure about 8 hours to 280 degrees C. The product is vulcanized with 250 grams of sulphur chloride.

A subsequent process, tending to increase the tensile strength of the products, consists in dissolving 100 grams of crude rubber in 300 of melted naphthalin at the lowest practicable temperature, then adding to the solution 400 grams of Chinese wood oil and 700 of some resin or resinous substance as pitch, asphalt, or the like. The naphthalin must then be driven off by steam heat, which effects the vulcanization of the mass.

Or one kilogram of the material produced by following the directions in the first patent mentioned is dissolved in 3 kilograms of naphthalin, and then 100 grams of caoutchouc dissolved in 300 of naphthalin are added. The latter being driven off by distilling with steam heat, the mass is ready for use.

A PARACHUTE FOR THE AEROPLANE.

Obviously the drawback to all aeroplanes is the great possibility of coming too suddenly to earth. A number of parachutes have been invented for the personal use of the airman, the purpose being that if anything happens to the aeroplane he can cut loose from it, letting it take its own course, while he, buoyed by his parachute, drifts down quietly and safely to earth. But a more comprehensive parachute has recently been devised which aims to keep up the entire machine. It is folded away in a little box over the flyer's head and has ropes attached to all corners of the frame. If anything happens to the machine the pilot releases the parachute, which opens up above and brings pilot and aeroplane both gently to earth. At least this is the theory.

Some Neglected Near-by Markets—IV.

SALVADOR.

THE average American who is able to remember the names of all the Central American Republics feels a distinct pride in his accomplishment and naively refers to the excellence of the memory which has preserved this knowledge since his grammar school days. They are, in his estimation, spots on the map, representing insignificant and ill-defined regions outside of all civilized travel, steaming with tropic heat, inhabited mostly by savages, mosquitoes and boa-constrictors; the chief industry, revolutions, and the chief product, miasmatic fevers. This ignorance is not far from the level of that found in a few remote corners of New England, where they believe that all the people west of the Mississippi are a rude, ungodly lot who carry revolvers and express their emotions in broadsides of profanity.

But the man who is proudly able to reel off the names of the five republics—or six, if we count Panama—will decline to locate them unless he has a map at hand. When he looks at the map he fixes their relative importance or unimportance by the space which they occupy and, accordingly, gives Salvador a very low place. It is true that, on a map of North America, Salvador does not make a very big showing, but there are considerations other than geographical extent. The country having the least area of all the counties in the United States is New York County, New York, which is not a negligible quantity in the affairs of the nation. Salvador has a population as great as that of the State of Kansas, though its area is less than that of any American State except Delaware, Connecticut and Rhode Island. This is a point well worth the exporter's attention. A sparsely settled territory may have a great future, but a thickly settled country has an indubitable present. And there is no need to argue the elementary proposition that in a densely settled community the problems of transportation and distribution are reduced to a minimum. Salvador has a population of about 250 to the square mile, a density nearly ten times as great as that of the United States. This is made more impressive when we reflect that a like density would give our average American townships of thirty-six square miles a population of no less than nine thousand. The population of Salvador, moreover, is industrious, thrifty and peaceable. About half of it is of Indian blood, while the remainder is chiefly of mixed European and Indian extraction. A minority of pure whites exists, forming a sort of natural aristocracy of wealth and education, but separated by no hard and fast lines from the cultured element among those of mixed race. The negro element is small, chiefly foreign and confined to the sea-coast towns.

Are the Indians civilized? They are, and have been since long before the coming of the white man. They belong to the Tlascaltecan branch of the Aztec family, who submitted to their Spanish conquerors exactly as our own Saxon ancestors submitted to the Normans, and the reproach is no greater in one case than in the other. Peaceable, unarmed, unorganized farmers, they were no match for trained soldiers equipped with the best weapons the times afforded and urged on by greed of gold and power. But the Indian, as did the Saxon, has stayed and multiplied and it is no longer a reproach to belong to the conquered race.

If we imagine the population of Kansas settled on 10 of the 105 counties of that State, we would see that it was well worthy the attention of our manufacturers. And when we realize that Salvador is little further from New York than Kansas itself, it is really time for our business men to sit up and take notice. Only a thrifty and industrious people can

exist in such numbers on so small a territory, and such a people are always good customers. The farms of Salvador are really a series of gardens, interspersed with villages and towns. The soil in many districts is fourteen feet deep and everywhere of amazing fertility. In fact, this very fertility is the chief difficulty with which the tiller of the soil has to contend. The weeds spring up behind him in the row he has sown. A few weeks of fallow turns his garden into a miniature jungle. But, as may be imagined, no slothful and slipshod methods are followed in a country which supports 250 to the square mile more than one person to every three acres—and exports millions of dollars' worth of agricultural products. Within the limits of this little republic is grown every garden product of the tropic and temperate zones. The hot coastal belt is but little more than ten miles wide, the remainder of the country being salubrious uplands, with forest-covered mountains intersected with fertile and cultivated valleys.

The far-famed Balsam of Peru is a product of Salvador and nowhere else. Its misnomer dates back to the time when Spanish America was either "Mexico" or "Peru" and

—Pan American Union.

A BALSAM TREE IN A FOREST IN SALVADOR.

everything coming by way of Panama was considered Peruvian. It is the product of a leguminous tree known as *Myrospermum peruviae*, but which the botanists of the region very reasonably ask to have called *Myrospermum salvadorensis*. It would seem, however, that the generic synonym, *Myrospermum*, is preferable, in view of the manner in which the characteristic product is obtained. It is a lofty tree, frequently reaching a hundred feet in height, with the characteristic

leaves of its tribe and a yellow, one-seeded pod. This balsam is secured by incision of the bark in much the manner that rubber is obtained. It will flow at any time, but the best results are had in the dry season, which coincides with the inclination of the "balsameros," who find occupation in other industries when the rains are coming down. This balsam is a fragrant oleo-resin, having medicinal virtues recognized today as well as centuries ago. The tree begins to yield a product of value when about twenty-five years old and with proper care will continue to yield for fifty to seventy years. The wood is valuable for furniture, being similar in color and quality to rosewood, which belongs to the same family.

The great staple of Salvador is coffee, of which, in round figures, eight million dollars' worth annually is produced for export. This is about one-twenty-fifth as much as the coffee exports of mighty Brazil, with a territory nearly five hundred times as great. In the production of gold Salvador, area for area, exceeds any other country on the face of the earth. Its commerce, with ten million dollars of exports and more than six millions of imports, has increased about 50 per cent. within four years past. Something more than a third of its imports come from the United States, chiefly cheap cotton cloths, flour, machinery and the coarser forms of hardware—all staples which sell themselves and give only moderate profit, leaving the cream of the trade and profits to European merchants, who have twice as far to carry their goods, which often cost more to produce than do the American.

In this busy, energetic little state American rubber manufacturers can find a ready market for several lines of goods. Belting and other lines of mechanical goods are called for in constantly increasing quantities, as the native manufacturing industries are passing rapidly from the household to the factory stage; every village is planning for electric light and power; the mines of gold, silver and other minerals are steadily increasing their output, and scientific equipment and the plantations are using machinery more and more with each passing year. When we remember that the farms of Salvador are really gardens and that the only weather contingency which the gardener dreads is that of drought, it ought to be the business and pleasure of one or several American manufacturers to teach the Salvadoreans the uses and virtues of garden hose. The streams are there in abundance and the dams and reservoirs will not be long lacking when the cultivators of the soil realize that they can remove the last chance of failure in producing their crops. The numerous cities and villages, with their large proportion of wealthy and cultured people, offer a market for druggists' sundries which will compare favorably with many portions of the United States. Rubber shoes, of course, are not greatly in demand in this or any other hot country, but there are still a few everywhere who will endure the heat for a time in order to go dry-shod during the season of tropic rains. Road building on a scientific basis has made a beginning and the density of population makes feasible what could hardly be undertaken in a more sparsely settled country. Automobile roads now connect some of the principal towns away from the railroad and in a very few years it will be possible to motor from one end of the republic to the other. And the rich crook who breaks the speed laws will be followed by a Mestizo policeman on a motorcycle, and Indians on bicycles will scorch after them to see the fun. Somebody is going to finish the tires, and why not the American?

The salesman who goes after this trade must speak the Spanish language, though a foreign accent will do him no harm if he is intelligent and polite, regretful that he cannot speak the pure Castilian of his customer and profoundly grateful for the courtesy which overlooks his failing. And he must not be too impatient of "manana." If the customer says "manana," manana let it be. Better an order tomorrow,

or even the next day, than no order to the end of time. There are two sides to the question of sauntering or galloping through life and, as Sancho Panza would put it, a bird in the hand is worth two in the bush, and when you are in Rome you should do as the Romans do. Trade is conducted on the basis of the buyer's wants, in matter, in manner and in time; and it is distinctly preferable that the merchant should say "Manana" than "Adios, Señor!"

Postal and telegraph facilities are excellent and the telephone service is very complete, it being possible to telephone from one end of the country to the other. Banking facilities are all that could be desired. Hotels are good and prices very moderate.

The best way to reach Salvador is by way of Panama, passing thence by boat to the port of Acajutla, whence a railway of sixty-five miles' length leads to the capital, San Salvador. Here, at the traveler's leisure, he can plan his trip through this land of picturesque scenery and lovely gardens. If he has understanding, sympathy and philosophy he will vastly enjoy his experience; and if he has tact and business sense he will add to the worldly prosperity of himself and his employer.

The principal ports other than Acajutla are La Libertad and El Triunfo, on the Pacific Coast, and La Union, at the head of the bay at the eastern end of the republic. Acajutla, though itself an insignificant village, being the terminus of the railway system leading to most of the important towns, handles nearly half of Salvador's foreign commerce. San Salvador, the capital, has a population of 60,000, with pleasant suburbs in addition. Santa Ana, twenty-five miles away by rail, has 53,000; other places of importance are San Miguel, 25,000; San Vicente, 20,000; Santa Tecla, 18,000; Sonsonate, 17,000; Chanameca, 12,000, and Coatepeque, 12,000.

In 1912 the aggregate imports of Salvador equaled \$6,774,859, of which about one-third came from the United States. The total included the following amounts from three principal sources: United States, \$2,627,700.22; United Kingdom, \$1,904,546.16; and Germany, \$664,674.45.

Rubber goods from this country formed the relatively small proportions of \$30,413 in 1912 and \$27,312 in 1913. Belting, packing and hose represented in the earlier year \$8,214 and in the later period \$13,169. Rubber goods not specially enumerated were respectively \$21,643 and \$12,422. Smaller amounts of rubber boots and tires made up the amount.

Our total exports to Salvador for the two years 1912 and 1913 amounted respectively to \$2,421,284 and \$2,389,971.

The rates on rubber goods via the Panama line from the loading piers New York to La Libertad and Acajutla are (including mackintoshes and raincoats) 53 cents per cubic foot, or 95 cents per 100 pounds, at ship's option of weight or measurement.

The total exports of Salvador in 1912 were \$8,936,795, of which the United States took about one-sixth, or \$1,519,154. Under this head were included 25,493 pounds of rubber in 1912, valued at \$19,684; the amount for 1913 being 12,753 pounds, value \$7,433.

On July 18, 1914, the government of Salvador fixed the export duty on rubber at 0.02 peso silver per kilo (\$0.38 per 100 lbs.); this being the rate for the year 1915 or until further notice. The freight rate from Acajutla and La Libertad on crude rubber to New York is \$1.25 per 100 pounds, via the Panama Railroad Co.'s steamers.

The Consul General of the United States is Henry F. Tennant, at the capital, San Salvador. The Consul General of Salvador in the United States is Señor Encarnacion Mejia, who is stationed at San Francisco, which, hitherto, has had most of the trade of our country with Salvador. The Consul at New York is Señor José Alfaro Morán, 42 Broadway; and at New Orleans, Señor Antonio Peralta.

The Editor's Book Table.

THE VALUATION OF RUBBER ESTATES. BY L. C. PECK, Director of the Merger Rubber Estates, Limited, 1914. (Singapore: Kelley & Walsh, Limited; London: Lithingham Wilson. [Cloth, 8vo., 181 pp., 12s. net].)

THE growth of the rubber plantation industry and of the ever-increasing inclusiveness of books on rubber topics are both shown by the title of this volume.

At the time THE INDIA RUBBER WORLD was started there was practically no rubber literature, while a book "On the Valuation of Rubber Estates," if written at that time, would have read very much like the celebrated chapter on the snakes of Iceland. Yet with the passage of a few years comes a time when it is assumed that enough men are able to purchase rubber estates and desirous of so doing, to make profitable the issue of a moderate-priced book dealing with the subject expressed by the title of the work under consideration. Mr. Peck says that the usual method of valuation is to figure a certain assumed production and price, then assume the annual expenditures, deduct the latter, then decide from this income what the estate is worth. It is a result easily attained and, in the author's opinion, it is like most things easily gained not worth much after you have it.

The assumptions made in the work are based upon Malayan experience, but, in the opinion of the author, are generally applicable to plantations of the eastern world, one variation being offset by another in a different direction. An interesting statement of his elucidation of this point is that, owing to the direct buying of Americans, the price realized by the planter is usually better at Singapore than at London.

Mr. Peck assumes that in any well-managed enterprise the entire capital necessary to the bearing stage will be met by annual calls, as needed. He assumes that all the rubber now planted, together with that soon to be planted, will not be sufficient to meet the world's demand for rubber at fair prices. He considers ten per cent. as a reasonable return for future years, with twelve per cent. as the present normal basis. He thinks that investors, who feel that their perfectly safe investments should yield the twenty per cent. realized by the venturesome pioneer, are not altogether reasonable in their expectations.

Turning the author's pounds sterling into American dollars, at the inexact but convenient ratio of one to five, he places, as follows, the normal cost of bringing rubber into bearing: \$35 an acre for the first year after planting, \$25 for the second, \$15 for the third, \$15 for the fourth and \$10 thereafter each year until tapping has begun. This represents planting on cleared land. The cost of clearing represents an expenditure of \$25 to \$50 an acre. Other costs of planting he puts at about \$15. The average he places at about \$45, making the total expenditures up to the beginning of the fifth year an average of \$145 an acre. The capital required for tools, machinery, etc., after tapping has begun, Mr. Peck figures at \$15 an acre.

In the fifth year the planter ought to get a hundred pounds of rubber from each acre of healthy trees, and this ought to go on increasing. There is a wide variety of estimates as to what eventual yield may be expected, from a minimum of 300 to a maximum of 800 pounds. The author thinks that 500 is a safe estimate for the maximum yield in the ninth year and thereafter. The cost of production and sale of mature rubber he places at 9d, or eighteen cents, a pound. Referring to the low yields of young trees, he believes that at present prices tapping will not pay, and that it would better be deferred until a better yield could be expected.

As to the future price of rubber, the author, writing in January, 1914, predicts a moderate rise with considerable fluctua-

tions during the present year, with a gradual drop thereafter. He thinks that 1916 will see an output of plantation rubber alone which will exceed the total supply of every description for 1913, and he believes that reclaimed rubber and the inferior grades of wild rubber will soon be practically out of the market. He believes that the average quality of plantation rubber will be better in succeeding years, owing to the larger proportion which will be derived from mature trees. This brings before us the prospect of a vast supply of uniformly high quality rubber at a price low in comparison with figures of the recent past.

Mr. Peck believes that the eventual normal price of rubber in the Singapore markets will be a shilling a pound, this allowing for fair wages, reasonable contingencies and a planter's profit of ten per cent. on invested capital. He thinks, however, that lower-priced rubber will so stimulate consumption that this normal price, otherwise due in 1921, will not actually be realized for some years later. The reasons for all his conclusions are worked out with great clearness and detail and the work is of interest throughout.

NETHERLAND GUIANA, SOUTH AMERICA--ITS DEVELOPMENT, Resources and Possibilities. By James L. O'Connor, Paramaribo. [Cloth, 8vo, 60 pages with 13 illustrations.]

IN this comprehensive handbook Mr. O'Connor has grouped a quantity of interesting matter affecting Netherland Guiana.

The principal geographical features of the Guianas are as follows:

	Area.	Population.
British	90,277 sq. miles	304,089
Netherland	57,900 " "	100,000
French	30,500 " "	40,000

Netherland Guiana (also called Dutch Guiana or Surinam) lies between British and French Guiana, with an area about that of the State of Mississippi. It is bounded on the south by Brazil and on the north by the Atlantic Ocean.

For the information of the visitors to the recent London exhibition, the booklet recalls the fact that on two occasions in its history Netherland Guiana was under English rule (1799-1802 and 1804-1815), having since the latter date been subject to Holland. Paramaribo, the capital, is situated about 18 miles from the mouth of the Surinam River. It has about 40,000 inhabitants, among whom nearly every nationality is represented.

In the shade the temperature seldom falls lower than 72° F., while it does not frequently rise above 88° F. The good health enjoyed by the Europeans and Americans who have for years made Netherland Guiana their home, bears witness to the salubrity of the climate. The average rainfall is 92 inches per year. While there is rain on about two-thirds of the days in the year, there is never a day on which the sun does not put in an appearance.

Among the chief physical features of the country is the network of waterways formed by some eight rivers, navigable for a certain distance to ocean-going steamers.

With luxuriant vegetation, indigenous trees and plants abound in profusion in the vast forests—which are full of wild animals and birds—while giant palms fringe the river banks.

Previous to the disturbance caused by the war, regular steamship communication was kept up by various companies with Europe and America, and a fleet of government steamers navigated the rivers of the country. The government railway, starting at Paramaribo, traverses the center of the colony for 120 miles, reaching half way to the Brazilian frontier.

AGRICULTURE

So rich and varied is the soil of Netherland Guiana that there is practically no tropical product which is not grown within its borders. Principal amongst them are sugar, cocoa, coffee, bananas, rice, cocoanuts, rubber and balata.

The production of sugar has been relatively stationary, having only increased from 10,931 tons in 1909 to 11,652 tons in 1913. Profits are, however, satisfactory, though plantations are small. Cocoa has been exported from Netherland Guiana for nearly 200 years, the area laid out representing 1862, 1,331 acres, 1873, 4,723 acres; 1913, 14,000 acres. Liberian coffee has since 1880 formed an important feature of the Netherland Guiana coffee industry. During the last six years it has been largely planted as a supplementary culture to rubber. In 1913 about 3,500 acres were bearing coffee, with a further area of nearly 4,000 acres in preparation for planting. The total exports of coffee to the United States and Europe were: 1910, 352,980 pounds; 1911, 431,790 pounds; 1912, 275,667 pounds; 1913, 455,504 pounds. Large profits are being made and are expected to continue.

Mr. O'Connor states that the "Surinam Congo" banana is of better flavor than the varieties from Jamaica and Central America. It excels, moreover, in carrying qualities and in withstanding a sea voyage. In 1913, the United States consumed 54,000,000 bunches, while English imports rose by more than 100 per cent. in the years 1903 to 1913, reaching in the latter year a total of 7,530,000 bunches.

RUBBER.

After unsuccessful results with seeds obtained from Pará in 1896 and 1901, an importation in 1905 from Henaratgoda (Ceylon) of 20,000 seeds produced 9,500 seedlings. The latter were planted out on clay soil and form the oldest regular planting in the colony. Another importation from Pará was made

obtained from the sub-culture of coffee and cocoa for some years. On plantation "Jagtlust" there is now a very good cocoa producing area together with ten-year-old *Hevea* trees. In annexed illustration rubber is shown interplanted with bananas. The following estimate is made of production per acre according to age of trees: 7 years, 110 pounds; 8 years, 150 pounds; 9 years, 210 pounds; 10 years, 250 pounds; 11 years, 280 pounds. At plantation "Voorburg" there are now 6,000 trees being tapped. This plantation has the largest area for *Hevea* under cultivation, and is about to instal machinery for preparing the rubber.

While no considerable quantity of rubber has as yet been exported from Netherland Guiana, the figure has grown from 2,200 pounds in 1911 to 8,900 pounds in 1913; and the author expresses the opinion that with the large areas planted in the last few years *Hevea* rubber will soon become an important article of export.

BALATA.

A comparison is made of the Berbice and Venezuela systems of tapping, the latter method resulting in a larger production at one time, while by the former the trees are spared for a second tapping. It is proposed to fell trees having a diameter exceeding 15 inches and to tap the thinner ones with a taphook.

The following were the balata exports of Netherland Guiana, in tons: 1907, 342; 1908, 447; 1909, 618; 1910, 878; 1911, 1,027; 1912, 723; 1913, 1,186. About 10,000 men are employed in the balata industry, which is one of the most important in the colony.

To those not familiar with Netherland Guiana, Mr. O'Connor's handbook will prove most valuable, while to those wishing to renew their acquaintance with the subject, it will no doubt be of interest.

NEW TRADE PUBLICATIONS.

FOR a number of years after the United States Rubber Co. began to make a line of tennis shoes its annual price lists were modest affairs, simply showing illustrations of the shoes and giving in addition a brief description of each brand and the sizes in which it was made and the prices at which it was sold. But the tennis list issued this year is much more ambitious. It is a small book of 24 pages, printed in three colors on heavy paper, and describes and illustrates 17 different brands. In addition to the old familiar names Champion, Yachting, Gymnasium, Bathing and Vacation, there are a number of new brands, such as Palmetto, Quarter Deck, Regatta, Week End, Colonial, Parade and Veranda.

Each page has illustrative scenes in colors apropos of the shoe described, and as the general atmosphere of sporting shoes lends itself admirably to decorative effects the general appearance of this price list is exceptionally attractive.

"Safety Always" is the title of a 36-page booklet issued by the Miller Rubber Co., of Akron, Ohio—being a comprehensive digest of facts that drivers should know. In this booklet the traffic ordinances, state and municipal, of New York, Pennsylvania, Ohio, Indiana, Michigan and Illinois are given, with directions for signaling and illustrated explanation of police traffic signals. Four pages are given to the merits of Miller products and the methods adopted in the manufacture of the Miller tire, etc. Road rules, both common-sense and otherwise—the latter known as the "Fools' Twelve Commandments"—are given a place in the booklet, which concludes with a list of the company's distributing branches and agencies, of which there are 36 in as many cities in different parts of the country.

The September calendar in the monthly series being distributed by the Derby Rubber Co., manufacturers of reclaimed rubber, of Derby, Connecticut, suggests in its decorative as well as in its calendar features the approach of the fall season. The upper

RUBBER INTERPLANTED WITH BANANAS.

the same year. Since then seeds have been regularly imported both by individuals and through the Agricultural Department.

The greater care and expense involved in the cultivation of *Hevea*, it is remarked, is usually compensated by the sub-cultures. In Netherland Guiana *Hevea* is practically always planted with bananas, this system having a very good influence upon the plants. The young trees are protected from sun and wind, while the soil is less affected by sunshine and rain. Another advantage is that with bananas a profit is obtainable after a year, while if planted alone the trees would be unprofitable for three or four years, if not longer. In addition to bananas, coffee or cocoa is generally interplanted with the rubber.

Bananas, if planted without any other sub-culture, can be kept for 2 or 3 years after which a profit can still be

part of the panel, over the business card of the company, contains a picture entitled "A Clean Double," showing a flight of wild ducks, two of which are making rapid descent, brought down by the rifle of the sportsman concealed on the edge of the lake.

A new wall hanger or window card, for garages and retail distributors of automobile accessories, and sufficiently striking in color effect to attract attention whether one happens to be in the market for such supplies or not, has just been sent out by the Firestone Tire & Rubber Co., of Akron. This hanger is 15 x 28 inches in size, printed in blue and orange on a white background, and calls attention in effective manner to the numerous tire patches and other accessories that form a part of the stock of the tire dealer. The hanger is arranged for mailing and can be folded for this purpose.

The National Association of Waste Material Dealers is issuing through its office at 170 Summer street, Boston, an Association Bulletin, the first number of which appeared on August 31, and later numbers of which will appear from time to time as matters of importance to members arise. This first number contains four pages, all filled with items of interest to waste material dealers generally, including a list of members—of whom there are now 88—of officers and committees, notices of meetings, standards of packing and a brief history of the association, which was formed March 24, 1913.

RUBBER RELIEVING LEATHER SCARCITY.

THERE is an old saying that "there's no great loss without some small gain." The present uncertainty regarding some lines of rubber manufacture, which, because of the unsettled conditions of business brought about by the European cataclysm, is pointing to a decreased demand for rubber, can certainly be partly balanced by the wonderful increase in the use of this material in the shoe industry.

Never but once before in the history of this industry has leather been so high priced as it is today. Once, along about the close of the Civil War, quotations were higher, but even then the prices were on a currency basis, with gold at a heavy premium. With the state of affairs at present confronting shoe manufacturers, it is a happy coincidence that the summer season just closed gave the stamp of approval to footwear in which other materials were used in place of leather, both in the uppers and in the soles.

The rubber footwear manufacturers have been making what are collectively known as "tennis goods" for many years. These were mainly cloth-topped shoes with thin cemented rubber soles. As outing shoes of the cheaper kind, and for yachting, outdoor sports, and for gymnasium use, these lines have had a steadily increasing demand.

Moreover, the public has been educated up to the value of rubber heels as shock absorbers and as means of securing noiselessness in offices and hospital.

Then the tango craze set in, and people discovered that the light rubber-soled tennis shoes made firm, non-skid footwear for indulging in this somewhat gymnastic style of dancing, and shoes which until then were looked upon as suited only to the piazzas or the beaches invaded the ball-rooms at the summer resorts, and later the fashionable city *soirées dansantes*. Then the tennis shoe manufacturers made dancing pumps with rubber soles, and sold them like hot cakes.

These are probably the main factors which led to the evolution of the stitched rubber-soled canvas shoe and the rubber-soled leather shoe, both of which, though formerly known and sold in a small way, never achieved a real vogue until last summer. During that season hundreds of thousands of rubber-soled shoes of stylish appearance and fine workmanship were sold. They became a fad at seashore and mountain hotels, as well as on the

promenades in all the large cities. Today the prices of all kinds of sole leather are high. Tanners say they must go higher. Shoe manufacturers may therefore hail with delight the growing demand for rubber-soled footwear. That the demand is growing is shown by the number of concerns which are now manufacturing rubber soles. It is a poor month which does not see a new concern starting in this line, while every company which previously made rubber heels has branched out in the manufacture of soles.

Naturally, there are various qualities of soles manufactured. The agent of a leading concern in this line stated to the writer that he could—and did—furnish rubber soles for as high a price as three dollars, and as low as thirty cents, a pair. It might have been these thirty cent soles which disgusted some shoe manufacturers, who had their shoes returned with the soles cracked through straight across the ball.

Of course every popular thing, if it is at all expensive, is imitated sooner or later in cheap quality. Rubber soles were no exception, but manufacturers have learned that rubber soles must contain rubber, and are buying soles which will not break in the machine sewing, and which will wear at least reasonably well under ordinary conditions.

One of the leading rubber footwear manufacturers seeing the trend of leather shoe prices, and foreseeing the probable inability of shoe manufacturers to produce a durable work shoe at a reasonable price, has added a line of footwear which is commanding a fast increasing trade. It has an upper of specially made duck of long staple cotton, a full slip-sole of rubber stitched to the upper, and a rubber sole stitched on by the Goodyear machine.

WORK SHOE WITH RUBBER SOLE AND HEEL.

The heel, of the usual height, is also of rubber. This shoe can be tapped or re-soled just like a leather shoe, and experience has shown that the upper will outwear two soles.

But it is not on work shoes that the use of rubber soles predominates. Quite the contrary. Today there are shoes of the best leathers and the finest workmanship with rubber soles and heels. Both men's and women's styles are thus made. There are ball-room pumps, promenade shoes, and business footwear not only for summer use, but for heavy winter wear. One objection raised against rubber soles is their weight. A thick sole of rubber is heavy, even though no more cumbersome than a similar thickness of leather sole. But with the better quality of rubber now demanded, the soles are made considerably thinner, while at the same time, because of the very nature of real rubber, they wear longer than the thicker leather sole. In fact a prominent manufacturer of these soles and heels states that in the impact of the foot on the pavement, rubber rebounds where leather scrapes along, and this fact accounts for the longer life of the former.

Another objection sometimes cited against rubber soles is their imperviousness. This is a distinct advantage in keeping outside moisture from the foot, but the opposite as inducing perspiration. This, however, is readily overcome by the use of leather insoles of good quality. Then again there is the tendency of rubber soles to slip on wet surfaces. To overcome this has been the subject of earnest experiment and study, and today, besides the various grades of more or less "pure" rubber soles, shoe manufacturers are offered, and are now using on their samples for next season, soles compounded of rubber vulcanized with a large proportion of disintegrated leather fibre, which, it is claimed, insure against slipping on wet pavements, and which are said to wear longer than either rubber or leather.

soles. Experiments have also been made by adding cotton fibre to rubber for soles and heels; and even "steel wool" is being used in some lines of rubber for giving added durability to the rubber.

Parenthetically, it may be said that for several years a prominent dealer in shoemakers' supplies has had a steady trade in soles and taps for repairing heavy shoes, to which he gives a fanciful name. It is really second-hand rubber belting died out in the shapes of soles, heels and taps. Every reader of this journal knows the quality of rubber and cotton duck used in making belting. These soles wear three or four times as long as leather of the best quality. While they show their layer construction at the edges, and no easy way has been found of

SUEDE OXFORD WITH WELL-SEWED RUBBER SOLE AND WEDGE HEEL.

"finishing" these edges, yet the soles are popular with motor men, teamsters and workmen, who demand wear, regardless of appearances. Why would not some experimentation along this line be profitable to the factories making similar lines of goods?

The spring and summer samples of shoes are now in the hands of salesmen on the road. Many manufacturers have directed their salesmen to keep in constant touch with their home offices, for with the present uncertainty of leather supply and leather prices, the cost and therefore the selling prices of all leather shoes are likely to be advanced any day. With rubber-soled shoes it is different. Manufacturers know, approximately at least, what the material will cost; so they can today set the prices for the entire season.

Manufacturers of men's and women's shoes in the fine and medium qualities state that they expect a heavy demand for rubber-soled shoes for next summer's wear. Of course opinions differ as to proportions, some believing that the call will reach as high as twenty-five per cent., while others, more conservative, place it at ten or fifteen per cent. If it only reaches the latter figure, that ought to be nearly forty million pairs of soles, sufficient to keep several factories busy for the next six months and absorb a considerable volume of rubber and compounding materials.

NATIONAL ASSOCIATION OF COTTON MANUFACTURERS AND THE FINANCING OF THE NEW CROP.

A report has been issued by the above association upon the recent Washington conference of those interested in the production, marketing, financing and manufacturing of cotton, attended by some 250 representatives of the cotton industry in its various branches. The conference was held on the invitation of the Secretary of the Treasury, Hon. William G. McAdoo, who stated that under the present law the banks could get all the currency necessary to take care of the situation. He considered that valorization was a wild and ridiculous experiment. It was his purpose to accept from the banks of the currency associations notes and obligations secured by properly issued and certificated cotton warehouse receipts. The banks, he considered, were the proper agencies to make the loans and to trace out the location of every bale of cotton behind the notes which were made the basis of this currency. He added that what was required was to get the cotton warehouses into shape.

In reporting to the members the result of the conference (in which he had participated) Mr. Albert Greene Duncan, the president of the association, has expressed the hope that support and encouragement would be given Secretary McAdoo on his constructive and conservative stand on the subjects dealt with.

THE COTTON SITUATION.

SOUTHERN spot cotton is receiving a good deal of attention at this time from the fact that the United States production for 1914 will approximate 15,000,000 bales. Under ordinary conditions 5,000,000 bales of this amount would be shipped to Europe and the remaining surplus production of our Southern cotton fields taken care of without further complication. The European war, however, created a condition that required prompt and effective measures to save the Southern cotton situation.

Prompt and effective measures were taken, and the assistance which the Federal Government extended to the cotton growers by the issue of National Bank currency, through designated banks, against notes secured by cotton warehouse receipts, has already greatly improved the situation. The result will undoubtedly be that the bulk of our cotton crop will be warehoused until the close of the war or until the spot price warrants selling. The fact that warehouse receipts are negotiable has resulted in a tendency on the part of the producers to hold their cotton. The cotton farmer is now able to renew his notes and secure further credit and supplies. He therefore views the present price of cotton with considerable indifference, and waits for a better market.

The "Buy-a-Bale-of-Cotton" movement has much to commend it for the enterprise displayed by its promoters, but as a practical business proposition it is open to some criticism. The movement had great advertising possibilities and was quickly taken up by keen advertisers with the object of furthering sales in the Southern markets. Among conservative people, however, the impression exists that a plan which would include the manufacturers of cotton goods in its beneficent scope would be more acceptable to the greater number of those interested in the cotton industry.

As a result of the war the foreign supplies of burlap have been entirely cut off. The estimated consumption in the United States is 700,000,000 yards per year. There is no burlap manufactured in the United States and consequently cotton goods must be used as a substitute. Some mills are now putting up their product in cotton goods in the place of burlap, thus creating a new outlet for cotton fabrics.

The estimated United States production of Sea Island cotton for this year will be 75,000 bales. Last year there was a shortage of 19,000 bales, which was made up from the previous year's crop. This means a shortage for the present year, as there has been no visible increase in the production of this staple. This indicates that the price of tire fabrics will be held firmer on account of the size of the Sea Island crop and the uncertainty of the arrival of Egyptian supplies due to the war.

It is understood that contracts are being placed for hose and belting duck on a basis of 19½ cents per pound, but this price is liable to advance with the price of the raw product.

LOW BIDS ON FIRE HOSE.

Of the bids opened September 11 by the City Commission of Trenton, New Jersey, on the fire department's requirements of 2,000 feet of rubber lined double cotton jacket hose, that made by the Empire Rubber & Tire Co.—62.9 cents—was the lowest. Other Trenton companies which submitted bids were The United & Globe Rubber Manufacturing Co.—68 cents—and the Hamilton Rubber Manufacturing Co.—78.5 cents. These are said to be the lowest bids ever received by the city under present specifications, which are considered very exacting.

GUIDING THE MOTORIST ON HIS WAY.

HAVING a motor car is not all of motoring—it is only one of the requisites. Another requisite is to know how to get to where you want to go.

Of course, in former years it was impossible to tell when you came to the fork of the roads which went where, and it did not always occur that some neighborly person familiar with the ground happened along just at that moment to give the needed information. To be sure, the good road books which began to appear in the old bicycle days and multiplied when the motor came in vogue were a material help, but still the good road books tried to cover so much ground in such little space that they left a great many puzzling corners entirely unattended to. And then, it is a great consumer of time, not to say a most inconvenient process, to take out a map at every cross road and discuss what particular point in the map fits the special place where you happen to be. The sign post that not only points the way but tells the distance is a vast improvement over the road book; and The B. F. Goodrich Co., of Akron, Ohio, if it does not exactly cover the United States with these sign posts, has at least made a very good start towards it, for its sign posts, with their explicit directions, now cover 40,000 miles of American high-ways.

This idea of giving the motorist on the road just the information he needs started in a small way some years ago with the Goodrich company, but it has now developed into an extremely large and very important department.

They now have three truck crews of trained men working in different sections of the country under the direction of their Touring Bureau. The type of sign decided upon after long and careful experimenting is simple, effective and durable. It is circular in shape, is made of porcelain enamel in three colors, with arms pointing to destinations in as many directions as are required. Each arm shows the town name and mileage thereto. The enameled sign is erected on a ten-foot, creosoted post of cedar or oak. Danger signs are placed at railroad crossings and short turns, and every effort is made to assure safety to the tourists. When one considers the extent of the territory covered, the magnitude of the task is appreciated; but little by little they are recording distances in all sections. As stated above, they have already road-marked over 40,000 miles of highway and expect to do many more. Their guide posts have been endorsed by practically all of the State Highway Commissions and several of these bodies have even gone so far as to erect on their own initiative these same Goodrich guide posts along their more traveled roads. Among these are the associations of South Dakota, Wisconsin and Michigan.

To be sure, the basic purpose back of these road guides is to

bring the Goodrich tire to the attention of the motorists. In other words, it is an advertising device. But it is a very welcome

ONE OF THE GOODRICH GUIDE-POSTING CREWS ERECTING A ROAD MARKER.

and effective sort of advertising, because it cannot fail to get the good will of tire purchasers. Nothing is quite such a relief

to the tourist's mind as to find at the crossing of the ways an accurate index finger pointing him just where he wants to go and indicating just how long it will take to get there. Here is a photograph of one of the Goodrich guide-post trucks at work.

Another department of the Goodrich Touring Bureau, and one that is desperately hard worked in summer, is the department

RAYMOND BECK, CHIEF OF THE TOURING BUREAU.

E. C. TIBBETS, GENERAL ADVERTISING MANAGER.

devoted to giving applicants specific information regarding any piece of road in which they may be interested. The Bureau often receives as many as 400 requests in a single day from people who want to know all about a certain piece of road, possibly in Maine, likely enough in Florida, or perhaps over on the Pacific coast. In order to answer all these questions the Bureau is compelled to be familiar with all the roads of importance in the United States; and that is no small job, when one recalls that the mail route roads of the United States alone aggregate over a million miles.

These requests for special information not only come from all over the country, but come from all kinds of people. The Bureau does not inquire even whether they use Goodrich tires. No questions are asked, no charge is made, and all get the information they desire. Here is a photo-reproduction of Mr. Raymond Beck, chief of the Bureau. The other portrait shown above is that of Mr. E. C. Tibbets, who, as the general advertising manager of the Goodrich company, encourages and abets Mr. Beck in the highly valuable and exceedingly humanitarian work of throwing light on dark places and guiding the stranger in the way he should go.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE general rubber trade in Akron is about in the same condition as it was before the European war. Factories are running about the same, several of them having under contract or in their possession a crude rubber supply sufficient for the remaining months of the year. The others feel confident of being able to secure all the crude rubber they need, so that the general tone of business is good. Some of the factories at the beginning of hostilities cut down their working forces, but these have been increased again practically to the previous number.

The mechanical rubber line is strong and active. The tire business is slow, as is generally the condition this time of the year.

* * *

The Firestone Tire & Rubber Co. is working on a new addition. The slowness in general business during the last year and a half has affected very little, if any, the rapid construction and enlargement of the Firestone plant. This is reflected in the yearly report of the company, which was submitted at the annual shareholders' meeting, September 2, at which the old board of directors was re-elected, as follows: H. S. Firestone, R. J. Firestone, Will Christy, Amos Miller (of Chicago), and Dr. Sisler.

The sales for the fiscal year ending July 31 amounted to almost twenty million dollars, on which the net profit was \$2,857,719. The increase in output during the year was 78 per cent. over the previous year's production, which was by far the largest of any year in the company's history.

On October 15 the Firestone company will hold its sales convention, and the active sales force, which consists of between 250 and 300 men, will be in Akron for a week. These conventions form a sales school of the highest type and have proved very beneficial to the company. The work of this force in the field has caused to be added since last October 95,000 square feet of floor space to the Firestone plant.

* * *

The Republic Rubber Co., of Youngstown, Ohio, under the direction of Thomas L. Robinson, and sales manager John H. Kelly has just held its yearly sales meeting at Youngstown.

* * *

The Akron Rubber Mould & Machine Co. is placing on the market an improved vulcanizer for auto. dealers who wish to do their own repairing.

* * *

The Adamson Machine Co. has commenced construction of a \$20,000 addition to its building. It is also installing new machinery in the part of the factory completed about one year ago.

* * *

The Akron branch of The Birmingham Iron Foundry is manufacturing an automatic mixing apron, for which its inventor, Mr. P. E. Welton, claims special merit.

* * *

The Gordon Rubber Co. announces an increased business as the only effect so far experienced as a result of the war.

* * *

W. W. Wildman, general manager of the Portage Rubber Co., says: "The European war has had no effect in the business of the Portage Rubber Co. except in the way of increasing our sales, as since the war has been declared our business has been better than ever before, and we have been compelled to operate our plant overtime.

"We might add that our sales for the first nine months of our twelve months previously, and at the present time we are fully thirty days behind on orders. We are now adding to our power plant by installing a battery of Stirling boilers. This, with addi-

tional equipment that we are putting in, will enable us to largely increase our output."

* * *

The Mohawk Rubber Co. is remodeling a building 61 x 100 feet, and building another 31 x 56 feet.

* * *

Charles E. Wood, crude rubber broker of New York, has opened an office in Akron—at 308 Hamilton Building—of which C. E. Siegfried will have charge.

President B. G. Work, of the B. F. Goodrich Co., and Mrs. Work have returned to their home from Carlsbad after an exciting trip through the European war zone. Their automobile was seized by the German government and the French chauffeur retained by the German troops. After suffering various other inconveniences they arrived at Rotterdam, from which place they sailed for New York.

* * *

The magnificent home of Frank Seiberling is rapidly nearing completion. The immense park, with its natural scenery, which surrounds it, affords a setting which is rarely excelled by a combination of the best of nature and of artistic skill.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE Boston rubber goods situation is peculiar, though probably no more so than in any other section of the country. A canvass of the different branches of the trade gives one a pretty fair idea of the state of affairs, but in some cases widely divergent ideas as to present conditions and future prospects. I wish I could give you the details of these personal interviews with the names of the persons questioned, but there seems to be a most marked disinclination on the part of many to have their views published with their names attached. They were not backward, however, in expressing their opinions, provided their names were not mentioned.

For instance, an importing house told THE INDIA RUBBER WORLD correspondent that while at first the securing of crude rubber was a difficult matter, the situation is clearing; that considerable rubber en route from the Far East was held up because the ships containing it were flying flags of belligerent nations and had therefore put into neutral ports to prevent capture. There were many such ships in the harbors of the Mediterranean. The carrying trade from South American ports is generally in British or German owned ships and they had discontinued their sailings. Then Brazil declared a long-continued holiday, the banks closed and it was impossible to do business. Later, though rubber was for sale, there was no possibility of exchange. This importer, however, hunted up some one with claims against South American merchants, purchased the accounts for cash, and bought rubber, tendering these accounts as payment, and secured some hundred tons of crude rubber.

Few consumers purchased crude rubber at the high quotations noted a few weeks ago. Of course every manufacturer has a larger or smaller supply on hand, and unless he was seized by the contagion of alarm, he refrained from buying, running the risk of higher prices later. It proved a good gamble.

A manufacturer of mechanicals, when interviewed, said that business is considerably behind that of a year ago, a fact accounted for by the general tendency in all lines to economize, and to the shutting down, or working on short time, of many manufacturing establishments.

Regarding druggists' soft goods, a producer says that while the demand may not be so general, there are some large contracts being offered by the syndicates which run a larger or smaller number of stores. These people are close buyers, but

they give quantity orders, and the factories are kept running along on full time at a moderate profit.

The waterproof clothing men are busy, though with some of them the outlook is not so bright. Their foreign trade is cut off, and with some this is an important part of their business. Then, again, they complain of the difficulty in securing some lines of fabrics which they need. Those using imported cloths are not the only ones affected. Many who have contracted for domestic fabrics find the mills held up because of the embargo on dyes. However, some of the makers of high class garments report a heavier trade on these goods because of the decline in imports of foreign made waterproof coats and cloaks.

The tire men seem to be hit pretty hard. Some factories have curtailed their output. One factory where a small number of tires was made has discontinued this department. Another is working only four days a week, while a larger producing plant is working right along with as large an output as usual.

The rubber boot and shoe factories are running reasonably full. Many retailers who declined to order in the spring and early summer are now stocking up, and this reassures the jobbers to the extent that they are sending in supplementary orders to the manufacturers. The mills made up floor stock during the summer in anticipation of this very condition, and shipments are heavy.

The Boston Boot and Shoe Club is the largest trade dining club in the city. During the fall and winter months six or seven banquets are held at the Hotel Somerset, to which some of the most noted speakers of the country are invited. Once, several years ago, a "Rubber Night" was held, at which many prominent members of the rubber footwear industry were guests. There is a possibility that an evening this season may be devoted to this subject.

* * *

Hon. L. D. Apsley, president of the Apsley Rubber Co., of Hudson, was suddenly called to Lock Haven, Pennsylvania, early last month by the severe illness of his venerable father, who died on September 10. This was a second affliction to Mr. Apsley, whose wife died only a few months ago.

George Apsley was Lock Haven's "grand old man." Up to his ninety-fifth year he walked back and forth every day from his house to his shoe supply and findings store, which he established in 1861. He was born in Chestertown, Maryland, in 1818. His son, L. D. Apsley, made it a duty to spend Thanksgiving every year with his father, and on every such visit a game of checkers with the old man was a regular part of the programme. It is reported that this was the origin of the checker board printed on every case of Apsley rubbers sent from the factory.

* * *

Ira F. Burnham, president and treasurer of the Stoughton Rubber Co., spent his vacation at Whitefield, New Hampshire. He returned to business September 10, reporting very cold weather in the White Mountain region, with the summits of the Presidential range covered with snow.

Washington B. Cook, manager of the Boston store of the Gutta Percha & Rubber Manufacturing Co., had a lively experience early last month. He had been summering, with his family, at Lake Sunapee in New Hampshire. Business requiring his presence in Boston, he decided to spend the night at his home in Sharon. Arriving there at a late hour, he opened the front door with his latch key and was confronted by a burglar, armed with a revolver. Ordered to put up his hands, Mr. Cook, who was certainly surprised, and who was unarmed, obeyed the order, and the thief escaped. Then Mr. Cook got busy at the telephone and a man-hunt was instituted by the police, in which more than 300 citizens took part. An hour or two later one of

the volunteer searchers, tiring of the game, started across lots to his home, when he saw a man enter the bushes on the lawn. Later he saw the man lying in a secluded spot. The telephone brought the police, who found a man soundly sleeping in the bushes with Mr. Cook's revolver in his hands and the Cook family jewels in his pockets. Mr. Cook is congratulating himself that his timely arrival saved for him jewels and silverware of considerable value.

* * *

The Haskell Golf Ball Co.'s suit against the Sporting Goods Sales Co. has been decided in favor of the Haskell company. The United States Circuit Court of Appeals found the complainant's patent valid and that the defendants' ball was an infringement holding that the Haskell ball's core and shell in combination produced a new mode of operation and that the patent is not void, as disclosing no patentable invention.

The C. A. Edgerton Manufacturing Co. of Shirley, has voted "that the name of this corporation be, and the same hereby is, changed to the President Suspender Co." Thus the name of the founder of this important business disappears; but sentiment must give way to modern business expediency. The product of this company is so thoroughly advertised that it has a world wide reputation, and it is certainly advisable that the company should bear a name easily identified with the goods.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent

EFFECT OF THE WAR ON THE RUBBER INDUSTRY

WHILE much anxiety was expressed among those concerns connected with the manufacture of rubber goods in Rhode Island during the days immediately following the outbreak of the war in Europe because of the fear that hostilities might prevent the procuring of crude material, a much more optimistic sentiment now prevails.

At first a very pessimistic feeling pervaded the local trade and several of the manufacturers in Providence and vicinity made no secret of their fears. Almost immediately a curtailment was begun in production and a cutting off in the time card and number of employees. However, the conditions do not seem to have been so disastrous as was anticipated and there is now a more settled feeling. A majority of the manufacturers now express themselves as confident that the coming winter's business will fully equal, if it does not exceed, that of a year ago.

Most of the factories are now working full time and to nearly full capacity. One plant, which dropped its night shift at the beginning of the European trouble, is still running short time, and the night workers are still idle. Another plant is holding all orders for Europe for the present, but is shipping some goods to other countries, especially to South America.

The makers of rubber boots and shoes are finding a fairly good business and most of these plants are being operated to their full capacity. The outlook is regarded as being very good with the price of crude rubber working downward.

Col. Samuel P. Colt, of Bristol, president of the United States Rubber Co., who arrived home early in September from Liverpool, was in Paris when war was declared. He had been in Europe for some time previous to the outbreak and had naturally given considerable attention to the interests of his corporation and to the rubber situation generally.

Concerning the effect of the war upon business Colonel Colt said, in an interview: "In the end the war in Europe is certain to prove of great benefit to the United States and its diversified business interests. We have already secured a great deal of trade that had formerly been closed to us, and we will not only keep it but will materially increase it. Of course, it is only natural to expect that for a time business would suffer, owing to the unusual and unnatural financial strain consequent upon the

terrible war which is mocking half a dozen of the great nations of Europe.

"As for the United States Rubber Co., I cannot speak very definitely at present, as I have only been able to go into its affairs and matters connected therewith cursorily since my arrival, but I am very glad to say that I have found affairs in practically as good condition as when I went abroad, which, of course, is highly satisfactory. Before I went abroad, I made special and specific arrangements for the importation of a ship-load of crude rubber from Singapore, to be delivered in this country for the United States Rubber Co. should the emergency require. It was further arranged, in order to be upon the safe side, that the ship carrying this cargo was to sail under the American flag. At the present time, however, it does not appear to me that it will be necessary to complete the arrangements in the Singapore deal.

"I believe that the war is to be of long duration and that nothing that the world has seen since the fall of Rome can compare with the present war in any particular. It is absolutely necessary, therefore, to be on the alert at all times to take full advantage of all business conditions and situations and to conserve all the forces possible to meet any exigencies. The general conditions, not only in this country but throughout the world, should naturally produce a good season's business, and there is no doubt to my mind that we must certainly reap the benefit, although, of course, we must expect that there will be a greater or less advance in prices all along the line."

The Davol Rubber Co., of this city, is operating its plant to nearly full capacity, about 85 to 90 per cent. of its force being now at work. Orders from Europe are exceedingly scarce at this time, the company not having had any calls direct from Europe in nearly three months. They have, however, been shipping a small amount of goods to China, Japan and South America.

"The principal effect of the European situation upon our business," said an official of the company, "is the high price of colors, talc and antimony, large quantities of which are imported. We have a limited supply of these materials on hand and are investigating domestic sources and have much encouragement that the deficiency may be met through such channels. As large quantities of these materials are necessary in the mixing of the rubber for our productions, we are especially concerned in this direction. Our manufactures include varied lines of rubber goods utilized in druggists', medical and surgical work, and it is only natural to suppose that these departments will be unusually stimulated. This is to be better understood from the fact that much of the surgical rubber supplies aboard the steamer 'Red Cross' was made by the Davol company, but was not shipped from the factory direct to the vessel."

The plant of the Bourn Rubber Co., this city, is being operated to full capacity at this time, and the outlook is reported to be very good. Reports from their agents in all sections of the country indicate that business is certain to be good from now on, if not better than a year ago, from the fact that retailers sold down so close last winter and spring. The wire department is also very busy, having large orders on hand.

The Revere Rubber Co.'s plant on Valley street is furnishing employment for about 75 per cent. of its capacity during the day time, working on a five-day schedule, closing down entirely on Saturdays. At the outbreak of the war it terminated its night shift and has not since resumed it.

The following is a list of all corporations, concerns and individuals connected with the rubber industry in this city that are assessed for \$50,000 or more, together with the valuation placed upon their property by the Board of Tax Assessors, according to the report just filed with the City Treasurer:

American Multiple Fabric Co., \$94,880; Joseph Banigan estate,

\$1,004,380; Joseph Banigan Rubber Co., \$160,100; Augustus O. Bourn, of Bristol, \$113,640; Bourn Rubber Co., \$147,000; Mary C. Banigan, widow of John J. Banigan, \$53,300; Samuel P. Colt, of Bristol, \$210,100; Davol Rubber Co., \$400,000; Glendale Elastic Fabric Co., \$175,400; Brown & Sharpe Manufacturing Co., \$4,074,440; Mechanical Fabric Co., \$389,740; New England Butt Co., \$191,420; Samuel M. Nicholson, \$199,600; Nicholson File Co., \$706,880; Rhode Island Hospital Trust Co., trustee under the will of Joseph Davol, \$450,000; Revere Rubber Co., \$1,443,780; Henry D. Sharpe, \$523,520; Lucian Sharpe, \$319,880; United States Mill Supply Co., \$57,340.

The tax assessors of the towns of Bristol and East Providence have recently filed their annual levies for the year, and the following are among the larger taxpayers. In Bristol, Col. Samuel P. Colt, president of the United States Rubber Co., is the largest individual taxpayer, his tax this year being \$2,852.55 on property valued at \$1,924,860. The Bristol list includes: Augustus O. Bourn, assessed on \$265,000; Sarah F. Bourn, \$140,000; Le Baron B. Colt and wife, \$90,000; Consumers' Rubber Co., \$124,000; National India Rubber Co., \$5,016,000.

The East Providence list includes: American Electrical Works, \$638,500; Eugene R. Phillips, \$22,235; Washburn Wire Co., \$380,516.

* * *

Substantial improvements have been made at the south entrance to the factory of the National India Rubber Co., at Bristol, where a new pavement of block stone has been laid to resist the encroachments of the heavy teaming.

Frank B. Wilson, of the clerical department at the National factory, is to be a candidate for Town Treasurer in Bristol.

* * *

The Killingly Manufacturing Co., at Killingly, Connecticut, operated by the Goodyear Tire & Rubber Co., of Akron, for the manufacture of especially heavy auto tire fabrics, has been installing considerable new machinery purchased in this city, which is expected to increase the output of the plant fully 30 per cent. The plant was first opened about fifteen months ago by the Killingly Cotton Manufacturing Co., but was later taken over by the present occupants, who have removed all the old machinery and replaced it with new and special machines. It is the only plant of its kind in this section of the country.

* * *

The City Council of Woonsocket has voted the money for the work upon the new footbridge across the Blackstone river, from Constitution Hill to Fairmount street, and the work has already been commenced thereon. This bridge will accommodate the hundreds of operatives who are employed in the Woonsocket Rubber Co. and other large mill plants in that section.

The factory of the International Rubber Co., at West Barrington, is being operated at present on the schedule of four days a week.

R. S. Emerson, of this city, has recently become agent of the Consumers' Rubber Co., at Bristol.

John Baker, formerly a department foreman at the factory of the Bourn Rubber Co., this city, and for many years previously department foreman on rubber coats at the National India Rubber Co., died at the City Hospital in this city recently of tuberculosis at the age of 56 years.

THE RUBBER TRADE IN CHICAGO.

By Our Regular Correspondent

THE rubber trade of Chicago is a little quiet, a fact attributable, according to local merchants, to the indirect influence of the war, a certain depression having been created which tends to inspire economies and to diminish expenditures.

Much tiling business is being placed with the rubber firms of

the city at the present time, many of the large office buildings which have been remodeled and erected during the summer having arrived at the finishing stage. These buildings, under present fire protection rules, all require a considerable supply of fire hose.

The Baker-Vawter Co., 22 South Clark street, had an attractive window display this week of the "Rush Rubber Eraser." The feature of the display was a magnetized glass circular motion outfit, in which a miniature clown and a Teddy bear ran a never ending relay race, with the eraser as the article to be passed. The display attracted a great deal of attention.

Rubber goods of all sorts for household use were on display at the National Household Exposition, which was held at the Coliseum here this week. The show was visited by thousands of people. From both financial and advertising standpoints, the exposition was a great success.

The Peoria Belting & Rubber Works—a branch of the Holmes Packing & Supply Co., of Chicago—is temporarily located at 1100 Old Colony Building, Chicago, its offices and sales rooms in Peoria having been completely destroyed by fire on July 27.

The Manufacturers' Rubber & Supply Co. has been incorporated at Chicago by W. E. and W. R. Anderson and N. Johnson, with a capital stock of \$10,000, to manufacture, buy and sell automobile appliances and rubber goods.

The Positive Puncture Plug Sales Co. has been incorporated at Chicago to manufacture and deal in automobile supplies, accessories, etc. The incorporators are: John H. Nowlin, F. C. Corbitt and O. W. Pellage, and the capital stock of the company is \$15,000.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE war in Europe has had no depressing effect on the rubber trade of Trenton, trade activities going on without apparent interruption of any kind.

The Thermoid Rubber Co., whose developments demanded additional space, has purchased a plot of ground 75 x 1,000 feet in area adjoining its present works. This company manufactures, in addition to various other rubber goods, the "Nassau" tire, which has especially distinguished itself in a number of the recent races. In the Elgin National Trophy race, late in August, the winner, Ralph DePalma, covered the entire 301 miles without a tire change, three of the tires used being the same which he had used in the 301 mile Cobe Trophy race of the preceding day, when an average of 73.6 miles an hour was made, with only one tire change. Nassau tires were also used in the Elgin race by Bob Burnam, who withdrew after 289 miles without a sign of tire trouble—a feat which he describes as "most remarkable for this course."

The Thermoid company has issued and distributed a War Atlas, containing maps of all countries engaged in the present war, with their colonial possessions. This atlas also gives tables showing the strength in numbers of the respective armies and navies, the principal cities in each country and portraits of the ruling monarchs. It is a book 10 x 13 inches, instructive and interesting and likely to be carefully preserved by all who receive copies. The only suggestion of its real purpose—that of keeping the Thermoid name and product before the public—is on the last page, where Safety Brake Lining is illustrated and its merits described.

The Essex Rubber Co. is erecting a new building at its plant

in this city. This building is to be of red brick and concrete, to cost \$100,000 and will cover the north side of a \$125,000.

The Ajax-Grieb Rubber Co., whose fiscal year ended August 31, reports a greater volume of business than ever before in the history of the company—and this in spite of the fact that a drop of 28 per cent. in tire prices in November last had to be made up before any gain could be shown. The Ajax company is optimistic regarding the coming season, the statement that "the supply of Ajax tires never has been equal to the demand" still applying. No advance has so far been announced in the price of this company's tires as a result of the war and none will be made as long as the supply of crude rubber lasts which was bought at prices prevailing before the war.

A novel idea has been successfully followed out by an Ajax dealer in Alabama. Scouts are sent out around the town who note the condition of owners' tires and report to the dealer. He in turn reports to owners whose tires are so worn as to be likely to soon need new casings, and their trade is solicited. This service is said to be in favor with the automobile owners and to be building up a large trade for the dealer.

State receipts from motor vehicles amounted for the first seven months of the year to \$734,573, a gain of \$145,565 over the corresponding period of last year and of \$73,127 over the entire year 1913. In the seven months 63,097 cars and 8,854 motorcycles have been registered and 60,626 drivers' licenses issued.

Howard Zelley, the Newark branch manager of the Empire Rubber & Tire Co., of Trenton, started September 15 for an extended business trip, which will include Buffalo, New York; Cleveland, Ohio, and Detroit, Michigan.

The John A. Roebing Sons' Co., which manufactures rubber covered and other wires, recently contributed to St. Francis' Hospital in this city the sum of \$2,000 towards the purchase of a sterilizing plant. This company has been a benefactor of St. Francis' on numerous occasions in the past, having furnished rooms in the institution and also donated the land required for its growth.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent.

THE Knight Tire & Rubber Co., of Canton, Ohio, which was formerly represented in San Francisco by the Hallway Co., has established a direct factory branch in that city, of which J. A. Fry—who has been connected with the Knight company for some time—is manager.

This company has also established salesrooms at 1710 Broadway, Seattle, Washington—in charge of E. J. Moskowitz—from which the trade of Oregon, Washington, Idaho and British Columbia will be supplied with Knight tires.

E. D. Wilson, formerly connected with the Savage Tire Co., of Los Angeles, has purchased the business of the Webster Supply House, at Twentieth and I streets, Bakersfield, California, the only exclusive automobile supply house in that city, which he will continue along more extensive lines, having put in a new and complete stock and equipment.

The Fisk Rubber Co., of Chicopee Falls, Massachusetts, has established a factory branch at 725 South C street, in Seattle, Washington, intended to supply the trade throughout the southern and western part of the state.

A contract has been made between the Pacific Tire Co., of Seattle, Washington, and the United States Tire Co., calling for

the use of that company's tires on all the motorcycles employed in the department.

* * *

The Universal Tire Co. is purchasing additional equipment for its automobile tire plant at Anaheim, California, the president of the company, H. H. Hallaway, having recently visited the eastern market for this purpose.

* * *

The Davis-Fry Manufacturing Co. is turning out at its plant in Oakland, California, a line of pneumatic tires and tubes for automobiles as well as a solid truck tire, under the brand name "Hercules." The patent rights of this company cover the making of a tread with fabric on edge, a new feature in construction which is said to prevent skidding and to add greatly to the durability of the tire. The fabric is placed at acute angles with the road.

FATIGUE IN MOTOR TRUCK TIRES.

By A. P. Eves.

THE automobile truck as it is known today is the product of less than ten years' thought and endeavor and the whole industry is suffering from want of experience. The tires are the most talked of part of the machine, because they are the subject of more trouble and more expense than all other parts of the machine combined. This condition finds the manufacturer of tires at fault. He has not progressed as fast as the manufacturer of other truck parts. Solid tires for large trucks are made along the same lines and with practically the same chemicals as horse-drawn vehicle tires were compounded from ten years ago. Excessive strains due to high speeds under heavy loads, it seems, have been entirely over-looked in tire construction.

The steel manufacturer was not long in arriving at the conclusion that steel as made when the automobile was in its infancy would not stand the repeated work under heavy loads of the speeding machine. The automobile industry brought forth the need of an anti-fatigue steel. The steel manufacturer produced nickel, chrome-nickel, vanadium and a host of other special steels to meet the demand; and they met it nobly.

Solid tires do not stand the work required of them. Tires that are guaranteed for 8,000 and 10,000 miles on the average in New York and Philadelphia do not run 2,500 miles. To be sure they are adjusted, but there is the delay and inconvenience of the change.

Tire manufacturers after two or three years of observation and some spasmodic experiments, have adopted a schedule of carrying capacities which is now considered standard. This schedule concerns itself altogether with the dimensions of the tire but specifies nothing whatever about the composition of the tire. It does not mention a standard density or include a physical requirement.

A new steel had to be made to stand the strains of the fast going and heavily loaded machine. The automobile made possible the anti fatigue steel. Rubber is much like steel in many respects. In the by-gone days of small carriage tires, if the tire had a good tensile strength, with proper elongation and set, it was considered good. The automobile industry has brought forth the fact, that altho rubber may be up to requirements in tensile strength, elongation, and have the necessary resiliency, when it is subjected to repeated work undergoing vibrations caused by shocks it must possess other qualities to enable it to meet these entirely new conditions. Take a small piece of rubber one inch square and of any convenient length, hold it so that two inches of its length can be stretched an infinite number of times. If the two inches of the exposed surface is stretched to two and a half inches a certain number of times it will break. Now, then take another piece of the same composition and same

dimensions and fasten it so that the exposed two inches are compelled to stretch three inches. It will also break but in much less than half the time. As these strains approach more nearly to the elastic limit, the deterioration is enormously hastened. This fact assumes great importance when it is noted that the deterioration does not take place at the same rate in all compounds.

A one inch section of a good solid tire compound should elongate $5\frac{1}{2}$ to 1. That is, the one inch section should stretch five and one-half times. It should take between 1,500 pounds and 1,600 pounds to produce this elongation, when the test piece will break. One hundred pounds will probably stretch this test bar one-half inch; if this load can be repeated several hundred times the test piece will break, yet it has never at any time had the full load which is at least 1,500 pounds. The rubber has been worn out by the repeated load of 100 pounds, and this is the action that wears out the tires in service and the greater the load the sooner the tires wear out. This action is called the fatigue.

Compression is another factor in the disintegration of the solid tire. If a load of 25 pounds is placed on a square inch of rubber it will yield; if the load is removed the test piece will fly back to its original form. If this action is repeated a great number of times the rubber will disintegrate. This is a quality that should be taken into consideration in the manufacture of the anti-fatigue tire. This is the action a rubber tire gets under load.

Repeated elongation and compression under a standard load should be a great factor in producing the truck tire of the future.

The man that owns the truck is the one that suffers most from bad tires, and he should insist on having good tires, as they are cheaper in the long run. Then he should be careful of them. Overspeeding and overloading would break axles, steering knuckles and springs if it did not wear out the tires, but as tires are made for the protection of the other machine parts they are the first to go.

The automobile industry has brought forth the need of an anti-fatigue tire or a compound as near anti-fatigue as possible. The automobile manufacturer is also partly to blame for the poor showing of the tires today. He does not insist on quality; all he asks is a long mileage guarantee and a low price. Quality is not a consideration, and it is cheaper to make replacements than to give quality, for adjustments are not made at manufacturers' prices.

A RUBBER COMB WITH A HOLLOW BACK.

This "Revelation" hard rubber comb illustrated here cannot be properly classified under new goods, for as a matter of fact it has been on the market for several years and was described quite a long time ago in this publication; but it probably is new

REVELATION HARD RUBBER COMB

to many people, and it certainly is interesting, as it has the appearance of a very heavy comb and yet, its broad, round back being hollow, it is distinctly a light comb. Its size makes it easy to grasp, and its lightness makes it comfortable to use and less liable to break when it falls. (Harburg Rubber Comb Co., 335 Broadway, New York)

Replete with information for rubber manufacturers Mr. Pearson's "Crude Rubber and Compounding Ingredients"

News of the American Rubber Trade.

THE MULCONROY CO. TAKES ON ALL-METAL HOSE.

THE Mulconroy Co., of Philadelphia, has recently taken over the all-metal hose business of the Schoen-Jackson Co., of Pennsylvania, having acquired all its patent rights, stock and machinery, and employing all of its experienced metal hose workmen. The Mulconroy Co., owing to the increased demand for a flexible hose for high pressure steam, oil and gas, decided to add an all-metal hose to its line, and after many tests concluded that the Schoen-Jackson type best met the requirements and consequently took steps to acquire this line.

MODERN HOUSES FOR FACTORY WORKERS.

The American Hard Rubber Co., of New York, recently applied for permits for the erection of a number of two-story brick dwellings at College Point, Long Island. This is but the beginning of what will probably be an important development. This company built houses for its employes more than thirty years ago, on the community plan, but naturally modern conveniences were not very conspicuous in houses built so long ago. It is the company's intention to tear down these old dwellings and erect in their place detached dwellings with all the modern improvements.

A TRADE EXPANSION COMMITTEE.

The firm members of The Rubber Club of America have recently received a communication from the secretary saying that it has been suggested that a central committee of five manufacturers with offices in New York (other than the present members of the Executive Committee) be appointed as a Trade Expansion Committee to consider the problems that come under this general head and to supervise the distribution of information regarding the possibilities of trade in the foreign markets opened by the war; also to act as a War Conservation Committee to deal with any question of finance and commerce that may arise.

HOW TO RECOVER CONFISCATED CARGOES.

In the early part of September the secretary of The Rubber Club sent a letter to all the firm members of the club referring to confiscated cargoes and stating that "the Marshal of the British Prize Court has informed the United States Consul General in London that neutral owners of goods on vessels seized by British ships can obtain possession of their property, when not contraband of war, by applying to the Procurator General, Treasury Chambers, Whitehall, London, England, who will require proof of ownership and particulars as to freight, whether paid or unpaid."

APPEALING TO THE INDIA RUBBER WORLD FOR INFORMATION.

Since the outbreak of the war and the total disarrangement of European markets this publication has received a number of requests from English manufacturers for information relative to American supplies of the particular materials that they employ. One large English manufacturer wants to know where he can get rivets with hard heads and soft shanks. He says he uses over a million a month and would place a fairly large order at a reasonable price.

Another manufacturer also asks where he can get supplies of steel studs for non-skid tires.

Then there comes a request for zinc oxide, the source of the English manufacturers' supply of this chemical being shut off by the war.

A firm of London manufacturers has written asking where it can get supplies of insulating materials, including ebonite, vulcanite and vulcanized fibre.

From Italy comes a request for information as to who in America manufactures thin gutta percha tissue, the purpose in this particular instance being to cut it into narrow ribbons for mending torn papers.

RUBBER COMPANY DIVIDENDS

The Boston Woven Hose & Rubber Co., of Boston, paid on September 15 a regular quarterly dividend of 3 per cent.

The Rubber Goods Manufacturing Co. of New Jersey, paid on September 16 its sixty-second quarterly dividend of 1½ per cent on the preferred stock of the company and a dividend of 2 per cent on common stock.

The Kelly-Springfield Tire Co., of New York, has declared quarterly dividends of 1½ per cent on the 6 per cent preferred stock of the company and of 1½ per cent on the 7 per cent preferred stock—both payable October 1 to stockholders of record on September 15.

The Firestone Tire & Rubber Co., of Akron, has declared a regular quarterly dividend of 1¾ per cent on its preferred stock and a quarterly dividend of 3 per cent, also an extra dividend of 2 per cent on the common stock—payable October 15 to stockholders of record on October 1.

The B. F. Goodrich Co., of Akron, has declared a quarterly dividend of 1¾ per cent on its preferred stock—payable October 1 to stockholders of record on September 18.

The Goodyear Tire & Rubber Co., of Akron, has declared a quarterly dividend of 1¾ per cent on its preferred stock—payable October 1 to stockholders of record on September 19.

The Portage Rubber Co., of Akron, has declared its regular quarterly dividend of 1½ per cent on preferred stock—payable October 1 to stockholders of record on September 20.

The American Chicle Co. has declared a monthly dividend of 1 per cent and an extra dividend of 1 per cent on its common stock—payable October 20; also a regular quarterly dividend of 1½ per cent on its preferred stock—payable October 1 to stockholders of record on September 25.

The Batavia Rubber Co., of Batavia, New York, has declared regular quarterly dividends of 1½ per cent on preferred and 1 per cent on common stock; also an extra dividend of ¾ of 1 per cent on the latter—all payable October 1.

The Apsley Rubber Co., of Hudson, Massachusetts, has declared a semi-annual dividend of 2 per cent on the common stock of the company, payable October 1 to stockholders of record on September 28.

REGISTRATION OF COMMERCIAL DESIGNS.

A new law for the registration of commercial designs was introduced as H. R. 11,321 in January last, and was dealt with by the House Committee on Patents during a series of hearings covering several weeks. The result of the arguments submitted was the introduction on August 4 of a revised bill (H. R. 18,223) by Congressman Oldfield, chairman of the above-named committee.

The National Design Registration League of Philadelphia has been distributing copies of the latest bill which, it believes, will meet with little, if any, opposition if its need is duly impressed upon Congress by the interests concerned.

BIG BALLOON RACE

It is expected that there will be a big balloon race with seven competitors on October 8. The race will start from Pittsfield, Massachusetts. A valuable prize has been offered by Mr. Cortland F. Bishop, and the race will be held under the auspices of the Aero Club of America.

Replete with information for rubber manufacturers, Pearson's "Crude Rubber and Compounding" is a

GENERAL C. EDWARD MURRAY.

Military men are always interesting, and doubly so at the present time, when their achievements occupy so large a part of the world's attention.

General C. Edward Murray, treasurer of the Empire Rubber & Tire Co., of Trenton, New Jersey, and interested in a variety of other rubber enterprises, has been a military man continuously for nearly thirty years, and for the last fifteen years has been Quartermaster General of the State of New Jersey, with

the rank of Brigadier General. General Murray in fact has been extremely active in several different directions—first, as a rubber manufacturer; second, as a leader in New Jersey politics, and third, in his varied but continuous association with the militia of that state.

He was born in Lambertville in 1863, and it was quite natural that after finishing school and business college he should attach himself to the business controlled by his father, J. Howard Murray, who was a manufacturer of reclaimed rubber. This interesting event occurred in 1883, when Mr. Murray was rounding out his twentieth year, the firm name being Murray, Whitehead & Murray. Nine years later he had full charge of the business and not long after organized the Crescent Belting & Packing Co. and the Crescent Insulated Wire & Cable Co. These various companies, however, did not seem sufficient to engross his attention, so in 1902 he bought out the Empire Rubber Co., and four years later organized the Empire Tire Co.; these two companies being consolidated in 1913 and incorporated as the Empire Rubber & Tire Co.

One would imagine that these varied interests would fairly well occupy any one man's time, but, as mentioned above, General Murray became interested in military matters many years ago. He enlisted in the Seventh Regiment of New Jersey when he was twenty-two, and five years later was made paymaster of the regiment, and a few years later given the rank of Captain. In 1899 he was appointed Quartermaster General of the state, a position he has occupied ever since.

His early developed marked abilities as a political leader, and for nearly twenty years was prominent in the higher Republican

circles of his state and frequently represented his district at national Republican conventions. From 1894 to 1904 he was City Clerk of Trenton. When the Progressive party was organized two years ago he became one of its conspicuous figures.

He was married in 1891 to Miss Cornell, daughter of John W. Cornell, of Trenton, and has three children, the two oldest being boys, who have already associated themselves with the Empire Rubber & Tire Co., one—J. Cornell Murray—as vice-president, the other—C. Edward Murray, Jr.—being connected with the manufacturing department.

The secret of General Murray's successful career is not difficult to fathom. In the first place, he has the greatest of all human assets, a magnetic personality. He is well disposed towards the whole world, consequently the whole world is well disposed toward him. Notwithstanding the innumerable demands upon his time, he is never too busy to see a friend or listen to a stranger. Added to this the possession of an inexhaustible energy, which enabled him to take up each task with enthusiasm; to build up to their present importance the various rubber enterprises which are under his control; to give so much service to the military organization of New Jersey, and to continue year after year such a potent factor not only in the civic life of his city but in the best political development of his state.

PERSONAL MENTION.

Theodore Hofeller, president of Theodore Hofeller & Co., dealers in old rubber at Buffalo, New York, who with his wife sailed for Europe on June 16 last with the expectation of returning about the middle of September, arrived at Boston, September 9, on the "Laconia," having left Carlsbad, Austria, soon after war was declared and visiting Munich and Lucerne en route.

W. J. Kreuder, who has succeeded Clark Swinehart as factory manager of the Vulcan Rubber Co. at Erie, Pennsylvania, was formerly superintendent of the Walpole Tire & Rubber Co. plant at Walpole, Massachusetts.

F. C. Millhoff has been promoted from the tire sales management of the Miller Rubber Co., Akron, to the position of general sales manager.

Earl E. Bain, formerly assistant secretary of the Chicago Motor Club, has been appointed manager of the Dayton Rubber Manufacturing Co., of Dayton, Ohio.

R. P. Dowse has withdrawn from the sales force of the Goodyear Tire & Rubber Co. and is now connected with the Kelly-Springfield company's selling department.

J. S. Paul, formerly connected with the Pittsburgh Rubber & Leather Co., of Pittsburgh, Pennsylvania, has joined the sales force of the Voorhees Rubber Manufacturing Co., of Jersey City, New Jersey.

Mr. J. Wrench, sales manager of the Industrial Chemical Co., under whose management the company has materially increased its business in the rubber trade in this country, returned on the Mauretania on September 3, from the English provinces, where he had been visiting friends.

Mr. J. J. Moriarty, formerly assistant superintendent of the plant of the Goodyear Tire & Rubber Co. at Akron, and later superintendent of the company's plant in Canada, has severed his connection with the Goodyear company. Mr. Moriarty has had many years' experience in the management of rubber factories in the United States and Canada.

Mr. William Fewell has been made manager of the New York City branch of the Lee Tire & Rubber Co. of Conshohocken, Pennsylvania.

Mr. Trumbull Warren, president and treasurer of the Gutta Percha & Rubber, Ltd., Toronto, was among the first to volunteer for war service in the Canadian contingent.

THE UNITED STATES TIRE CO. HAS NEW MANAGER

Mr. J. D. Anderson, who has been identified with the manufacture and sale of tires for the last twenty years, has resigned as general sales manager of the United States Tire Co., his successor being Mr. Joseph C. Weston, the Central District manager for the company, who has lately been acting as general sales manager in Mr. Anderson's protracted absence in Europe.

Mr. Weston is also a veteran in the tire trade, having been secretary of the Morgan & Wright Co. for many years. Later, on the formation of the United States Tire Co., he became its Western District manager, with headquarters in San Francisco. From this position he was promoted to the Central District managership.

HARRY N. TOWNER

Harry N. Towner, president of Towner & Co., of Memphis, Tennessee, died at his home in that city September 22. He was stricken with apoplexy on September 10 and owing to the fact that he had been in impaired health for the last five years he was not able to rally from the attack.

Mr. Towner was born in Connecticut April 3, 1851. His boyhood was spent in the city of Baltimore, but he was educated in the Episcopal college in Cheshire, Connecticut. While still a young man he became associated with his father in the firm of Towner, Landstreet & Co., of Baltimore, in the mill supply business. He went to Memphis in 1879 and established the firm of Towner & Co. for the wholesale distribution of all kinds of rubber goods, and when the firm was incorporated in 1905 he became its president, his son, R. Paul Towner, being secretary and treasurer.

TRADE NEWS NOTES

The Toledo Rubber Co., which deals in rubber goods of all kinds for the vehicle, hardware, railroad, shipping, drug and clothing trades, under the brand name "Torco," has recently enlarged its offices and sales rooms at 428-30 Summit street, Toledo, Ohio. The company now occupies a modern five-story fireproof building 40 feet wide and with a total floor space of 24,000 square feet.

An analysis by chemists of the State Food Department of the chewing gums being offered the public discloses the fact that four of the brands labeled "pepsin gum" contain no pepsin whatever. The manufacturers have been notified that they must discontinue the sale of this misbranded gum or prosecution to the full extent of the law would follow.

More than 400 conductor miles of wire for distributing electric energy and light service have already been called for in specifications for the new Equitable building under construction in New York. This wire will be supplied by the Simplex Wire & Cable Co., of Boston.

The second International Safety Exposition will be held from December 12 to 19 at the Grand Central Palace, New York, when a large number of foreign and government exhibits will be shown in addition to those of industrial enterprises. Awards will be made in five grades to exhibitors in every branch of industry.

That the war in Europe has had no serious effect on the automobile trade of the United States, or on the buying capacity of the public, is shown by the fact that during August the Ford Motor Co. sold 20,638 cars. This company sold during the year to August 1, 221,888 cars, an average of about 18,500 a month.

The Loewenthal Co., 37 West Thirty-ninth street, New York, well-known operators in scrap rubber, have taken the agency of L. M. R., a popular mineralized rubber which has been on the market for many years. The reputation of this product, supplemented by the progressive methods and extensive connections of the Loewenthal Co., would seem to assure large sales of L. M. R. in the rubber trade.

The annual meeting of the Intercontinental Rubber Co. will be held in Jersey City on October 5. Proxies have been distributed by the company in the names of Edward B. Aldrich and Willard B. Smith.

The Midgeley Tire Co. is now operating its plant at Lancaster, Ohio, in the production of the Midgeley Tread tire.

Contracts have been let for the erection of a \$5,700 addition to the factory of the American Rubber Reclaiming Co. at 406 East Rittenhouse street, Philadelphia.

A decrease of the capital stock of the Asbestos & Rubber Works of America, of New York, from \$75,000 to \$40,000, was authorized on September 23.

The Morgan & Marshall Co., which manufactures the M. & M. tire, has recently made quite a generous contribution toward the Lincoln Highway, purchasing fifty memberships in the association, at a cost of \$250.

Fire Commissioner Adamson, of New York, who believes that efficiency and economy in the purchase of hose may be effected by having specifications occasionally reviewed by business experts acting with the fire department heads, is to appoint a committee for this purpose, to be composed of representatives of the Board of Fire Underwriters, the Chamber of Commerce, the Merchants' Association, the Board of Estimate and Apportionment and the Fire Department. The work of a similar committee appointed three years ago resulted in a revision of specifications which reduced the price of 2½-inch hose from \$1.20 to 68 cents a foot.

A well known rubber man who has become identified with the house of Charles E. Wood is Mr. W. C. Betts, formerly of DeLong-Betts company. Mr. Betts has had a long and successful career in the rubber trade and is probably one of the best known crude rubber men in the United States. His present location will afford an excellent opportunity for him to renew his large acquaintance in the trade.

Lyman M. Bourn, for five years chief chemist and manager of the materials department of the Goodyear Tire & Rubber Co., Akron, has severed his connection with that company to accept a position as manager of the Double Fabric Tire Co., Auburn, Indiana.

WHERE RUBBER HOSE TAKES THE PLACE OF FIRE.

Taking it all in all, a piece of rubber hose can be put to more uses than almost anything else in the world. A dweller in a city apartment house with an active mind has devised a new use to which a piece of hose can be put with great benefit. Like many other unfortunates, he lives in a house having steam heat but no hot water supply, being obliged to depend for his hot water on the kitchen range, which requires time to do its work. But having a steam radiator in his bath room, he took out the piece of pipe between the radiator and the standard pipe, inserted a T with a short projecting piece of iron pipe, which contained a valve. The rest was easy. To this short piece of pipe he attached a rubber hose long enough to reach well into the tub. Then to the tub end of the hose he attached a large open wire bulb around which he wrapped a cloth. He then filled his tub, dropped the end of the hose with the bulb into the water, turned the valve in the short piece of iron pipe and let the steam into the hose, through which it rushed, passing in a quiet and orderly manner through the cloth around the bulb and soon heated the water to a comfortable temperature thus saving time and gas bills.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

TRADE NEWS NOTES.

The selection of a date for the sale of the Walpole Tire & Rubber Co., of Walpole, Massachusetts, has been postponed until October 15, although the matter may be brought up before that time by any interested party on service of a week's notice.

It is understood that plans have been proposed—and a stockholders' meeting called for their consideration—for taking this company out of the receivers' hands and placing it under the management of new directors. Under such a reorganization the board of directors would be composed of John H. MacAlman (president), Fayette S. Curtis (first vice-president), George E. Keith (second vice-president), Charles H. Keith (treasurer), Franklin H. Downs, John S. Rand and Elisha B. Powell—all, with the exception of Mr. Powell, who is an attorney of Oswego, New York, being prominent Massachusetts business men.

An endurance test in which twenty-four motor trucks of various makes took part was recently held in California over an extremely rough 200-mile course, starting and ending at Los Angeles and leading through Riverside, Redlands and San Bernardino. The best record was made by a 1,500-pound Menominee truck, equipped with Firestone tires.

According to statistics filed in the office of the Board of Assessors for Chicopee, Massachusetts, the Fisk Rubber Co. will pay this year taxes amounting to \$10,000, the third in size of the city's assessments on manufacturing or business concerns.

Owing to the war in Europe and to the fact that many members of the Society would probably neither care to attend nor be welcome in Canada at this time, the American Chemical Society decided not to hold its annual meeting at Montreal during September, as had been planned. The annual meeting for 1915 is scheduled for April 1 to 3, at New Orleans.

An inflated tire tube recently saved the life of a young woman, who, while bathing in a New Jersey lake, got in beyond her depth and, being unable to swim, had sunk for the second time when her companion pushed the inflated tube out within her reach and so assisted her to safety.

The Carriage Builders' National Association is holding its forty-second annual convention at Atlantic City, from September 26 to October 2. Among those taking part in the exhibition at the Million-Dollar Pier, held in connection with this convention, are the Firestone, Goodyear and Kelly-Springfield companies, exhibiting tires, and the F. S. Carr Co., the L. C. Chase Co. and the Fairfield Rubber Co. showing artificial leather.

During the year 1912 there were 20,248,326 miles of wire in use in the telephone lines of the United States—a gain of 15,347,875 miles over the quantity in use ten years ago.

The desirability of wearing rubber gloves while engaged in certain electrical work is very strongly impressed upon workmen in rules for men engaged in electrical work recently submitted at a convention of southern electrical associations; while those operating switchboards are just as strongly urged to always stand on a rubber mat.

A canvass of the automobile industry by the National Automobile Chamber of Commerce shows a quick recovery from the effects of the war, shipments of 6,870 carloads having been made during August; and it is believed that the fall trade will very nearly reach previous expectations.

Protests have been entered by various ambassadors against the export of American automobiles to the warring nations, and there seems to be some intention of classing such shipments as "munitions of war and supplies."

Statistics show about one automobile for every two miles of country road in the United States.

DATES OF THE AUTOMOBILE SHOWS.

The Electrical Vehicle Show will be held in the Grand Central Palace, New York, from October 7 to 17.

The National Automobile Show, promoted by the National Automobile Chamber of Commerce, will be held in the Grand Central Palace, New York, January 2 to 9.

The National Automobile Chamber of Commerce will also promote a National Automobile Show to be held in the Coliseum and First Regiment Armory, Chicago, January 23 to 30. The shows under the auspices of the National Chamber are to be invitation affairs, only such motor car and accessory manufacturers as are members of the Chamber, and to the number that can be properly cared for, being invited to exhibit.

The Automobile Dealers' Association of Pittsburgh is promoting an automobile show to be held October 17 to 24.

At San Francisco the Panama-Pacific Exposition Co. is promoting the following races, to be held at the exposition grounds: Vanderbilt Cup Race, February 22; Grand Prize Race, March 7; Panama Pacific Cup Race, March 14.

KEATON TAKEN OVER BY THE COMBINATION.

The Combination Rubber Manufacturing Co., with factory and general offices at Bloomfield, New Jersey, and a tire department branch at 1790 Broadway, New York, has taken over and will continue the business of The Keaton Tire & Rubber Co., which manufactured special brand tires and tubes for a number of the large tire jobbing concerns. Mr. H. A. Forbes, former general manager of the Keaton company, is manager, and Mr. Frank C. Braden, sales manager of the tire department of the new concern.

A FAMILY HEIRLOOM CARRIED IN A RUBBER HEEL.

A lucky turn of events in which a rubber heel and an honest bootblack each played a part recently restored to a certain fortunate young woman a jewel of much beauty and great value, highly prized as an heirloom, which she had lost en route from Europe to New York on board the "Imperator." A thorough search failed to disclose the whereabouts of the lost jewel—a large pigeon-blood ruby—and it was not until after arrival in New York, when a bootblack of the Hotel Astor was polishing the shoes of the young woman's father, that the discovery was made. The ruby had become lodged in the rubber heel, in a recess formed to receive a nail for attaching the heel to the shoe.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in Spain desires to represent American houses dealing in crude and manufactured rubber of all kinds. Correspondence and catalogs should be in French and Spanish and metric units should be used; prices to be in gold pesetas (peseta equals 19.3 cents) f. o. b. any American seaport having direct connections. Report No. 13,595.

A business man in Oceania would be glad to receive catalogs and price lists from American manufacturers of surgical elastic, hosiery, abdominal belts, rubber gloves, etc. Report No. 13,678.

A large engineering company in Great Britain desires to correspond with manufacturers in a position to quote favorably on armored cables for high and low tension service. Report No. 13,758.

A dealer in Great Britain wishes correspondence with American manufacturers of ducks, drills, sheetings, etc., with a view to securing representation for that country. Report No. 13,779.

A leading wholesale chemist and druggists' supply house in Great Britain is reported in the market for a number of American sundries—vulcanite goods, douche fittings, syringes, surgical rubber goods, atomizers, etc. Report No. 13,761.

An import agent in Europe wishes to purchase, for cash, rubber shoes, etc. Correspondence may be in either English or Norwegian. Report No. 13,805.

TRADE NEWS NOTES.

The Miller Rubber Co., of Akron, which recently issued \$500,000 of new first preferred stock, has purchased land adjoining its present holdings with a view to further extension of its manufacturing facilities.

The Blodgett Rubber Co., a \$500,000 corporation of Warren, Ohio, has completed arrangements for the removal of its tire manufacturing plant to St. Joseph, Michigan, the Development company of that city having agreed to furnish a factory site and building which at the end of five years should under certain conditions become the property of the Blodgett company.

A factory for the manufacture of rainproof cloth is soon to be established at Fulton, Kentucky, by Harrison Brothers, of Union City, Tennessee.

The American Chiclet Co. has issued \$2,000,000 of additional stock and acquired the assets of the Sen Sen Chiclet Co., of Maine.

The capital stock of the Syracuse Rubber Co., of Syracuse, New York, has been reduced from \$25,000 to \$500, and a similar reduction has been made in the capital of the Rochester Rubber Co., Rochester.

The requirements of the fire department of Philadelphia necessitate keeping 126,000 feet of hose in active service, there being in the city 83 fire stations, each of which uses from twenty to twenty-five lengths of 50 feet.

A new form of polo has been introduced which is sure to gain favor among the tire manufacturers. The players are mounted on bicycles, the front wheels of which take the place of mallets in driving the ball.

A tire and accessory manufacturing company which will employ 60 men at the start has been incorporated in Ohio with a capital stock of \$350,000, under the name of The Toledo-Ford Tire Co. Plans under consideration call for the erection at Toledo of a brick and steel plant 60 x 250 feet in area, with equipment for a production of about 200 tires a day at the start. The incorporators are: R. F. Teall, C. E. Taggart, William Dunbar, L. P. Eichenberg and E. F. Felton. It is expected that the new plant will be ready for operation soon after January 1.

The Converse Rubber Shoe Co., of Malden, Massachusetts, has just been awarded a contract for furnishing the United States Navy Department with 1,200 pairs of Arctic shoes, at \$1.81 per pair.

Plans are under way for the erection of a \$50,000 brick plant, 80 x 250 feet, one story high, at New Brunswick, New Jersey, for the Endurance Tire & Rubber Co., of 1789 Broadway, New York.

The Whitall-Tatum Co. is adding to its plant at Millville, New Jersey, the cost of the new addition being estimated at \$30,000.

A rumor that the Hartford Rubber Works, of Hartford, Connecticut, would remove to Detroit, Michigan, has been denied by Charles B. Whittelsey, secretary of the company and factory manager.

The Stoddard Rubber Co., of Worcester and Millbury, Massachusetts, recently incorporated with a capital stock of \$60,000, will manufacture and deal in rubber, rubber tires, etc.

The H. W. Johns-Manville Co., of New York, has purchased the plant of The United Indurated Fibre Co., at Lockport, New York.

The Faultless Rubber Co., of Ashland, Ohio, is erecting a factory building 80 x 120 feet, three stories high.

At the works of the I. B. Kleierr Rubber Co., College Point, New York, several departments have been closed as a result of conditions caused by the war.

NEW INCORPORATIONS.

Accident Proof Tire Co., August 22, 1914, under the laws of New York, authorized capital, \$250,000. Incorporators: Keri L. Albertson, 54 Morningside Drive, New York City; James O. Hodge, 878 East Twenty-third street, and Carl W. Stuart, Oriental Hotel—both of Brooklyn, N. Y. To manufacture and deal in Cumberland tire filler and other auto accessories.

Brooklyn Tire Co., Inc., September 15, 1914; under the laws of New York; authorized capital, \$10,000. Incorporators: Willard J. Woodcock, Frank W. Woodcock and Beatrice Woodcock—all of 102 Gates avenue, Brooklyn, N. Y. Tires and rubber goods.

Crow Gum Co., August 6, 1914; under the laws of Delaware; authorized capital, \$100,000. Incorporators: F. D. Buck, George W. Dillman and M. L. Horty—all of Wilmington, Del. To acquire the business carried on by the Crow Gum Co., of Memphis, Tenn.

Hester Tire & Rubber Co., The, September 9, 1914, under the laws of Delaware; authorized capital, \$300,000. Incorporators: B. H. Friel, L. A. Browhill and G. M. Purcell—all of Wilmington, Del. To deal and trade in all kinds of rubber, etc.

Manufacturers' Rubber & Supply Co., The, August 20, 1914; under the laws of Illinois; authorized capital, \$10,000. Incorporators: W. E. Anderson, W. R. Anderson and N. Johnson. To manufacture, buy and sell automobile appliances, accessories and rubber goods of every description.

Parr Auto Shoe Co., September 10, 1914; under the laws of Indiana; authorized capital, \$10,000. Incorporators: W. A. Parr, G. E. Parr, William Featheringill and S. W. Featheringill—all of Franklin, Ind. To manufacture anti-skid or emergency shoes and other accessories for automobiles.

Positive Puncture Plug Co., September 4, 1914; under the laws of Illinois; authorized capital, \$15,000. Incorporators: J. H. Nowlin, F. C. Corbitt and O. W. Pellage. To manufacture, sell and deal in automobile supplies, specialties, accessories, etc., and to carry on any trade or business incidental thereto or connected therewith.

Russian-American Rubber Tire Works, Inc., September 8, 1914; under the laws of New York; authorized capital, \$100,000. Incorporators: Rose Miller, 477 Stone avenue; Isidore Kelner and Sruel Billik—both of 1549 Pitkin avenue—all in Brooklyn, N. Y.

Stoddard Rubber Co., Inc., September 4, 1914; under the laws of Massachusetts; authorized capital, \$60,000. Incorporators: Charles H. Stoddard, F. Madge Stoddard and Samuel L. Cowitz—all of Worcester. To buy, sell, manufacture and deal in crude rubber or rubber compounds and rubber tires for vehicles.

Washington Heights Auto Tire Works, Inc., September 21, 1914; under the laws of New York; authorized capital, \$5,000. Incorporators: William J. Buckley and Edward Buckley—both of 1748 Amsterdam avenue—and William F. Keyes, 526 West 145th street—all in New York, N. Y.

VACUUM-CLEANING THE HORSE.

The modern housekeeper would be at a loss how to proceed in keeping her home immaculate if she didn't have some sort of a vacuum cleaner; and what is good for the house is evidently good for the horse, for a vacuum cleaning apparatus is being used by some of the New York City departments for the grooming of the municipal steeds. The horse is first curried vigorously, so as to loosen up the dirt and dirt and germs, and then the cleaner is applied and all loose and unnecessary particles are carried off into the dust bag—a great improvement on the old system of getting the dirt off of one horse to supply the cleaner with dirt for the next. Nothing of what went into the lungs of the animal.

New Rubber Goods in the Market.

THE SEASON'S NEWEST COATS AND HATS.

The raincoats here illustrated represent a decided variation in style from anything previously noted in these columns. The first two models are in cape effect, the young woman's coat being of worsted, in a variety of color combinations, with a coating of rubber on the inside and cut with cape effect sleeves—which may be fastened close to the wrist by means of a glove clasp joined to the body of the coat in raglan style. The girl's rubberized cape coat is made with convertible collar and slashed pockets.

The London slip-on model is made in men's and youth's sizes, of double texture gabardine, with raglan or plain sleeves and with patch pockets.

The girls' coats represent such materials as Donegal Scotch tweed with cravenetted silk-lined yoke

and sleeves; rubberized poplin, and Priestley's English cravenetted mixed tweed. Both slit and patch pockets are shown, and plain and belted designs.

Each reproduction shows the waterproof hat appropriate to the style of coat worn.

RUBBER CEMENT CLEANER.

In the process of manufacture of canvas and leather shoes of white or delicate colors the uppers are usually covered with paper or cloth to prevent soiling. But in spite of this there is bound to be more or less dirt or stain in the handling, and frequently the cement used in attaching the soles daubs the upper. The general practice in factories is to use a cement ball, which is practically a piece of sponge rubber which in using assumes a spherical shape, but which in handling must take more or less dirt from the operator's fingers, while its shape prevents its use in crevices, etc. To take the place of this ball a cleaner has been devised which has somewhat the form of a buffing wheel or emery wheel. There is a tubular core around which the sponge rubber is arranged. This allows the cleaner to be grasped by the thumb and fingers, and in use the rubber wears equally, thus maintaining the wheel-shape. While it is not so stated by the manufacturers, the cleaner is evidently capable of being placed on a revolving shaft or spindle for quick work. [United Shoe Machinery Co., Boston.]

A RUBBER RELIEVER OF BUNIONS.

Doctor Scholl, presumably a doctor of chiropody—has prepared a small article for the relief of those who are possessed of bunions. It consists of a small, soft, pliable piece of rubber that fits in between the great and second toes and is kept in

place by thin rubber head and foot pieces. It looks, as a matter of fact, something like an enlarged collar button, with two hollow spaces running through its length. While this is so pliable as not to be uncomfortable, its effect is to force the great toe out into its normal position and thus relieve and in time cure the bunion.

Another invention of the Doctor's is a corn pad, also made of soft, pliable rubber, in various sizes, intended to alleviate the sufferings of those afflicted with corns on the toes, tender joints or callouses on the soles. [Scholl Manufacturing Co., 337 Broadway, New York City.]

GOGGLES WITH A SOFT RUBBER RIM.

A Chicago house has recently put on the market an eye protector called the "Dimmer Goggle," intended particularly for the motorcyclist. These are finished with a soft rubber rim which enables the protector to press closely against the face without creating any disagreeable feeling. These goggles are made of celluloid in five different colors—clear, amber, smoke, green and blue; and those made of amber color have an extra green strip about three-quarters of an inch wide running across the top, which makes it possible for the cyclist, by lowering his head a trifle, to face the setting sun or to ride immediately under a strong electric light without having his eyes at all affected. [Chicago Eye Shield Co., 128 South Clinton Street, Chicago.]

Replete with information for rubber manufacturers—Mr Pearson's "Crude Rubber and Compounding Ingredients."

SIX NEW TENNIS SHOES.

When tennis shoes were worn almost exclusively in playing tennis and other sports, or at least were confined in their use very largely to summer outings, they were made altogether without heels, this form being best adapted for wear in outdoor games. But recently these light rubber-soled shoes have become so popular for general wear that there has arisen a demand for similar shoes with heels, and in consequence the new tennis price list issued by the United States Rubber Co. shows six new shoes which have not appeared in any of their previous pub-

COLONIAL PUMP.

EMMY LOU PUMP.

WOMEN'S PARADE PUMP.

WEEK END OXFORD.

QUARTER DECK BAL.

REGATTA OXFORD.

lications, five of these shoes having heels. The accompanying cuts show their general appearance.

All of these shoes have rubber soles and heels, with duck uppers. The "Quarter Deck" and the "Colonial Pump" are made of buff or pure white palmetto duck with lining to match. The "Regatta" and "Week End Oxford" are made of white or brown duck, the former having a white rubber sole, the latter a gray rubber sole. The "Parade Pump" is made in black or white duck, with rubber soles and heels to match; while the "Emmy Lou Pump," evidently intended for young girls and children, is made of white duck with white soles or golden glow duck with red soles. As these duck shoes with rubber soles and heels are so much lighter and more comfortable—to say nothing of being so much less expensive—than leather shoes, they are likely in the future to be very extensively worn through the summer months.

PNEUMATIC TIRES FOR THE BABY'S HEAD.

A humane woman of Philadelphia, the city of brotherly love—including the extremely young brothers—has thought out a simple apparatus for keeping infants from bumping their heads on the floor or the wall. It consists of a pneumatic tube which goes around the forehead and the back of the head, with two similar tubes crossing over the top. This pneumatic harness is fastened on the head just like a hat, with a strap going under the chin. Equipped with this resilient accoutrement, the youngster can knock his head in any direction and extract only amusement from the process. It is probable that for sick children, who are very liable to tumble on slight provocation, this would prove a useful device, but for the ordinary youngster a certain number of bumps are a good thing, serving as a valuable preparation for the bumps of later life.

EBONITE MOLDING.

Ebonite molding for automobile bodies is now being turned out in a variety of designs. This molding, while more especially suitable for black finished vehicles and considerably more expensive than wood, retains its finish without much care and is said to hold its shape, being easily bent to almost any curve.

AN OPEN WORK PENHOLDER.

A new penholder has recently come on the market, made of hard rubber, differing from hard rubber penholders previously offered for sale in being hollow and having two long slits on opposite sides running half the length of the holder and two sets of short cross slits opposite each other between the two long openings. This slitted open effect makes the penholder light and somewhat elastic, so as not to tire the fingers even where one grasps his pen with unnecessary energy. [Tower Manufacturing & Novelty Co., New York.]

RUBBER COVERED TEMPLES FOR GLASSES.

A good many people who wear spectacles chronically have experienced the disagreeable sensation of having the temples (the name given to the wires that go over the ears) cut into the flesh, or at least chafe it. This is particularly likely to happen in hot weather, and is especially liable to occur where people are engaged in active exercise. To avoid this difficulty the F. W. King Optical Co., of Cleveland, Ohio, manufacturers of sportsmen's glasses, make a great many glasses in which a small, delicate rubber tube is pushed over the temples so that the wire does not come in contact with the ear or the head. This rubber covering not only tends to prevent chafing but holds the glasses firmly in place, a condition much to be desired by men who are in pursuit of game and therefore need the most accurate sight possible.

VACUUM CLEANERS FOR PULLMAN PORTERS.

That prophet of uplift and seer of visions, Elbert Hubbard, recently contributed to the magazine sections, which form a very readable part of many of the metropolitan dailies, an article on the unsanitary phases of the Pullman car, and he called particular attention to the industrious porter, who, just before the arrival of the train at its destination, grabs the helpless passenger and with his whisk broom removes the dust from his clothing on to that of his neighbors, and then, after receiving his tip, proceeds to remove the dust from the neighbors back on to the helpless traveler. Mr. Hubbard suggests, in place of this whisk broom, that simply moves the dust from one place to another to move it back again, that the porter be equipped with a vacuum cleaner—supplied of course with the proper length of rubber tubing—with which he can go over the person of the traveler, removing the dust in such a way that it would fly out into the outer air. This is a most excellent suggestion, and if the suction were made strong enough so that, after the cleaner had removed all the dust from the traveler's clothing, it would seize upon the porter and carry him also out into the outer air its popularity would know no bounds.

THE PUMP WITHOUT A GAP.

One defective feature has persistently appeared in every pump model that has so far been presented—it spreads at the arch when the foot is bent. But here is a model for which the claim is made that "no matter how the wearer bends her foot, this pump will never gap at the sides, either walking or standing." This being the case, one problem of the manufacturers is solved, for the pump is extremely attractive in appearance, the part that fits so closely around the foot being made of an entirely new elastic shoe cloth woven especially for pumps. It is made in black, white, bronze, pink and blue, in plain or brocade finish. [Hub Gore Makers, Boston.]

ERASER WITH PERPETUAL POINTS.

Where one wishes to erase a very considerable surface it makes no particular difference whether an eraser has a sharp point or a dull point; but it usually happens that the erasure to be made consists only of a small line, and it is quite desirable under these conditions to have an eraser with a sharp point. To meet this situation a Philadelphia company has put on the

market an eraser called the "Dandy" which, as is shown in the accompanying cuts, has a number of open parallel slits. As a result of this construction it is easy when the points or corners are worn down to remove a section of the eraser with a knife and start on the next section, with a new set of sharp pointed corners. These erasers are made in two shapes, one with rectangular corners and the other with diamond shaped ends. They are made also both for pencil use and for pen use. [John S. Rapsin, 51 North Sixth street, Philadelphia.]

A NEW DIXON ERASER.

To the wide variety of erasers on the market another style has lately been added. This is Dixon's 10955 red and gray disc eraser, a full size cut of which appears here with. The section composed of red rubber is intended for pencil marks and the gray for ink and typewriter erasures. [Joseph Dixon Crucible Co., Jersey City, New Jersey.]

TWO NEW DRESS SHIELDS.

One is made of pink silk, rubber proofed on one side, with pinked edges. The flesh tint and gossamer weight make it appropriate for evening or full dress gowns of diaphanous materials. It is also suitable for blouses of sheer material.

The other is of rubber-proofed silk, covered with flesh tint silk. The edges are finished with buttonhole stitching in the same shade. This is undoubtedly the finest and newest shield made. It is intended for both class gowns and fastidious dressers.

THE OVERNIGHT TOILET CASE.

A very convenient and necessary traveling case for a week-end visit, it is designed and made up to meet the requirements of the most fastidious. The case is rubber lined throughout and has a limited number of pockets to accommodate the necessary toilet articles. As the name indicates, it only provides space for such articles as a short sojourn would require. In design it resembles a novel shaped hand bag provided with a convenient carrying handle. The case opens at the bottom and when in use it is spread out upon the dresser or some convenient table. It is readily closed when the case is lifted by the handle, thus folding the halves together, which are held by several glove fasteners provided for that purpose. It comes in cretonne, mercerized gingham, plain and fancy silks.

The other cut shows a rubber-lined tourist case of entirely

new design that will appeal to the traveler. It is provided with an assortment of pockets of various shapes and sizes to accommodate the many articles used in the toilet. Considerable thought has been given to this feature in order to provide convenient places for the articles necessary when traveling. When in use the case is suspended and open, thus affording easy access to each toilet article. The case can be folded up and tied, when so desired, by a band provided for that purpose. It makes a neat and attractive receptacle for toilet accessories and occupies but little space in the traveling bag. It is made of materials similar to those employed in the overnight case. [Stern Specialty Co., 40-42 East Twenty-Second street, New York.]

RUBBER BANDS TO SAVE THE FINGERS.

It falls to the lot of a good many people doing clerical work in offices to be obliged to turn over a mass of letters or other documents in search of some particular paper. To do this one naturally lifts up the corner of the sheet with his finger, and in order that the finger may take hold of the paper it is generally customary to have a wet sponge at hand on which the finger can be frequently moistened. But this process if long continued is liable to result in a rather disagreeable sensation. To obviate this some inventive genius has devised a little corrugated rubber band which goes over the end of the finger, being loosened or tightened by a small buckle, and which has enough friction in its rubber surface to catch up the loose sheets of paper. [Tower Manufacturing & Novelty Co., New York.]

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World

New Machines and Appliances.

PLACING CROSS WIRES IN TIRES.

THE accompanying drawing shows a machine for inserting the cross wires in the bases of solid tires. The machine performs this operation on the finished tire of annular form, after vulcanizing. The tire is placed on a drum *A* having a ratchet in one edge so that it can be advanced step by step. This drum is mounted on a turn table *B* so that the tire can be turned to permit of inserting the wires at any angle to the base of the tire. With the tire in position and held down by a roller *C*, the treadle *D* is pushed down by the operator, engaging a clutch on the driving shaft *E* and causing a drill *F* to advance and bore a hole through the tire. When the drill is withdrawn, the wire *G* is gripped by a cam *H* and the end pushed forward into the hole in the tire. The wire is then cut off the proper length by a shear *I*, and the end projecting from the tire is pushed into place by a hammer automatically operated. The wire is straightened as it is drawn from the supply wheel by

and *I*, where it is sheeted, and stamped with any design or wording which may be engraved on the smaller roller.

[Pat. No. 1,110,340, September 15, 1914. L. Norzagaray, assignor to the Economic Washing Machine Co., London, England.]

KUENTZEL'S MACHINE FOR INSERTING CROSS WIRES.

being passed between rollers *J*. [Pat. No. 1,110,800, Sept. 15, 1914. C. Kuentzel, assignor to The Goodyear Tire & Rubber Co., Akron, Ohio.]

NORZAGARAY'S EXTRACTOR AND WASHER.

ANOTHER interesting machine just patented in this country is an extracting and washing machine designed by Norzagaray and illustrated by the accompanying drawing. The machine is designed for cleansing crude rubber, as well as for kneading and rolling it into sheets. The rubber is fed continuously into the top of a conical tube *A* and is forced down by the conveyor screw *B* until it passes out at the lower end of the tube. Hot water is kept running over the rubber from a tap *C* and from a perforated pipe *D* at the top of the tank *E*. Formed on the inside of this tank are spiral threads *F*, which engage spiral ribs *G* on a cylinder rotating in the tank. The rubber emerging from the lower end of the tube *A* is forced upward by these spiral ribs and thoroughly masticated while the hot water is continuously running over it. The mass of rubber emerges at the top of the tank and is passed between vertical rollers *H*

NORZAGARAY'S WASHING MACHINE.

EXTRACTS FROM RECENT PATENTS.

The following are brief extracts from the specifications of other interesting United States patents recently granted.

PULVERIZER FOR SCRAP RUBBER.

No. 1,102,789, July 7, 1914. Joseph Ogden, Manchester, England. A machine for grinding or pulverizing scrap rubber. The rubber is fed into a cylindrical hopper and comes in contact with a rapidly revolving disc having an abrasive surface or sharp cutting edges in the form of spirals.

METALLIC STOCK SHELL.

No. 1,104,296, July 21, 1914. William F. Gam-meter, Cadiz, Ohio. Metallic stock shell for winding up sheeted rubber or coated fabric as it comes from the calender. This roll is entirely of metal and is designed to facilitate cooling. It is an improvement on patent No. 1,003,593 of 1911.

LAST MAKING MACHINE.

No. 1,104,040, July 21, 1914. E. A. Eastman, assignor to the Crawford McGregor & Canby Co., Dayton, Ohio. Automatic machine for turning shoe lasts. It is interesting to note that, although the patent just granted covers minor improvements, the original of this machine was illustrated and described in THE INDIA RUBBER WORLD of May, 1904.

JAR RING AND GASKET LATHE.

No. 1,107,404, August 18, 1914. F. Brelle, Sr., and F. Brelle, Jr., Ferndale, California. A machine for cutting rubber gaskets or jar rings, wherein the rubber tube is placed on a revolving spindle and the cutter is automatically fed forward and advanced toward the tube. The knife may be adapted for cutting rings with a curvature in cross-section of almost 90 degrees.

DENTAL VULCANIZER

No. 1,107,441, August 18, 1914. N. W. Olson, Galesburg, Illinois. A vulcanizer for curing dental goods, opened and

closed by a steam cylinder whose piston has an extension for operating a rheostat, for controlling an electric coil which supplies heat for vulcanization.

IMPREGNATING BRAIDED HOSE.

No. 1,110,671, September 15, 1914. Henry Z. Cobb, Winchester, Massachusetts. An apparatus for passing the thread through a rubber solution to impregnate it before being woven into hose. The woven hose subsequently passes through a die to remove the surplus material. This patent constitutes an improvement on Cobb's patent No. 1,002,644 of 1911.

TIRE VULCANIZING PRESS.

AMONG the recent inventions in the field of rubber manufacturing machines is the tire vulcanizing press illustrated herewith. This vulcanizer is very simple both in construction and operation. The tires are first built up and placed in molds *A*, which are laid one above the other on the table *B* mounted on the hydraulic ram *C*. Each mold has a pipe *D* running from

DEES' TIRE VULCANIZER.

the interior of the tire to a valve *E*. These valves are all connected by flexible pipes *F* communicating with the outside of the vulcanizer through a flexible pipe *G*, having three valves, *H*, *I* and *J*. Each mold also has a tube *K* with a valve *L*.

When the molds are in place and compressed by raising the hydraulic plunger *C*, the valve *H* is opened and cold water is let into the tires until they are filled, when it runs out through the tubes *K*, closing the valves *L*. The valve *H* is then closed and steam is admitted to the vulcanizer through the pipe *M*. As the water inside the tires becomes warm by the heating of the molds, it expands and exerts an outward pressure on the tires. At the proper time the valve *J* is opened and the pressure of the steam opens the valves *L*, forcing the water out of the tires and filling them with steam. The valve *J* is then closed and the steam valve *I* opened, producing a pressure in the tire greater than that in the surrounding vulcanizer. This pressure is maintained until the curing process is complete. The principal advantage claimed for this apparatus is in the pressure exerted on the interior of the tire by gradually raising the temperature of

the water. [Pat. No. 109,048, Sept. 1, 1914, M. A. Dees, St. Louis, Missouri.]

A BOLTLESS QUICK-OPENING VULCANIZER.

THE new boltless quick-opening vulcanizer head, manufactured by the Williams Foundry & Machine Co., Akron, Ohio, and illustrated herewith, presents several novel improvements.

The cast-steel shell ring and door have each a series of projecting lugs. The door is turned, by means of an iron bar in-

THE WILLIAMS BOLTLESS VULCANIZER.

serted into one of the projections, so that its lugs are forced under the lugs of the head-ring. This makes it impossible for the door to be forced outward. The door rotates on a trunnion at its center, which is a part of the cast-steel door hinge, permitting it to be swung open like any ordinary vulcanizer head. Stops are provided so that the operator is always sure to have the door in the proper position before the steam is turned on.

When steam is turned into the vulcanizer and the pressure raised to from one to three pounds, the wedge-shaped, automatic rubber packing effectually seals the joint against the escape of steam. There is not a bolt or nut to tighten, and the greater the pressure, the tighter the joint.

The points of advantage claimed for this head are a great saving of time, ease of operation and safety. The head is adapted to be applied to the old bolted type of vulcanizing cylinder.

BERTRAMS' ROLL BUFFING MACHINE.

THE accompanying illustration shows a machine designed for buffing and polishing calender and mill rolls, or any other rolls which require a smooth, even finish. On the heavy bed

of the machine are V-shaped slides, over which travels the carriage carrying the buffs. The buffs are driven by belts from a

long overhead drum. The roll to be ground or buffed is mounted in heavy bearing brackets above the center line of the bed, and revolves in its own journals. Grinding wheels are arranged on both sides of the roll in the carriage, and are traversed in both directions along the face of the roll, while the latter is revolved at a suitable speed. The overhead drum extends the full length of the machine, and is longer than the longest roll liable to require grinding. The roll is revolved from the driving shaft through two universal joints, and provision is made to compensate for the deflection of the roll so that a perfectly true surface may be obtained. [Bertrams Limited, Sciennes, Edinburgh, Scotland.]

A QUICK-ACTING VULCANIZING PRESS.

THE accompanying drawing shows a somewhat unusual form of vulcanizing press, designed by Paul Beer, of Berlin, Germany. Instead of the usual four steel columns, this press has two columns *A*, at the rear, and a single column *B*, at the front. It has two cylinders *C* and *D*, each of which is provided with gibs arranged to slide vertically on a guide attached to the column *B*. The cylinders may be swung around this column as a pivot, and may be raised or lowered by means of a piston *E* operating in a hydraulic cylinder *F*.

The articles to be vulcanized are placed in molds stacked upon a plate *G* on a truck *H*. The truck is then run under the cylinder *D*, which is open at the bottom and raised as shown. This cylinder is lowered over the molds by means of the piston *E*, and the plate *G* is clamped to it. The cylinder *C* in the press is relieved from steam and hydraulic pressure, and both cylinders are then swung around the column *B* until cylinder *D* is brought into position in the press, and cylinder *C* is directly over the truck. The molds containing the vulcanized goods

BEER'S QUICK ACTING VULCANIZING PRESS.

are then released by unclamping the plate *G*, and the empty cylinder is then raised by means of the piston *E*. While this is being done the press is operated to compress the molds, and to press the cylinder against the head *I* of the press. In order to

press the molds against the head, only a short movement is necessary. For this, a circular, hydraulic ram *J* is employed. It has two concentric movable rings which have wedge-shaped projections arranged so that the piston may be locked in its raised position. This circular, hydraulic press operates independently of the main ram *K*.

The advantage claimed for this type of press is that it can be charged and emptied simultaneously, thus reducing labor and economizing time. Also the ram and cylinder of the main press can be made shorter than usual, since the press operates only to compress the molds.

CONTRABAND OF WAR.

According to National Chamber of Commerce Bulletins issued in August Germany had agreed to follow the decision of the London Conference of 1909 as to the articles absolutely and conditionally contraband. Those articles conditionally contraband are liable to capture only if shown to be destined for armed forces or for government departments. The English regulations are practically the same as those of Germany, except that the German list includes aeroplanes, etc., in the conditionally contraband list while England places them in the absolutely contraband section.

EXTRACT FROM LIST OF LONDON CONFERENCE 1909

Absolutely Contraband.—Distinctively military clothing and equipment. Articles of camp equipment and their distinctive component parts. Aeroplanes, airships, balloons and air craft of all kinds and their distinctive component parts, together with accessories and articles recognizable as intended for use in connection with balloons and air craft.

Conditionally Contraband.—Clothing, fabrics for clothing and boots and shoes, suitable for use in war; vehicles of all kinds, available for use in war and their component parts; materials for telegraphs, wireless telegraphs and telephones.

FRENCH MOTOR CARS AND THE WAR.

According to advices from France, the subsidy scheme which has been carefully developed during the last six years is now proving of benefit to the nation. Uniformity of speed, size, carrying capacity, weight, tire and wheel dimensions have been the principal points kept in view.

There are said to be 70,000 motors with the French troops, 15,000 of which represent subsidized motor trucks, which went automatically into the service on the declaration of war and were immediately moved forward to the German frontier.

Besides calling for the subsidized vehicles, the army authorities have made large purchases of trucks of all kinds. There is in fact a shortage of this class of vehicle in France. The French Government assumed, on August 1, the control of the De Dion-Bouton plant, the workmen all donning soldiers' uniforms.

HOW TO GET GERMAN GOODS TO AMERICA

It is pointed out in the German press that there are perhaps two possibilities of sending goods to America, via Holland (Rotterdam) and via Denmark (Copenhagen). As soon as normal conditions are to some extent restored, and negotiations with the Dutch steam lines are formally concluded, goods will be sent to the Dutch frontier (Bentheim), where they will be taken care of by Dutch shipping agents for shipment via Rotterdam to America. German insurance companies decline the war risk, but it is suggested that Dutch underwriters might undertake it.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the World; Rubber Trade Directory of the World.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE RUBBER TRADE AND THE WAR.

AT the request of the editor, whose unexpected visit to England on the abandonment of his trip to Java has been a source of pleasure to his many friends on this side, I am devoting my space this month to comments on the effects resulting from the European war in which we are engaged. Special matters may conveniently be grouped under their respective headings and the first paragraphs will contain brief references to generalities not elsewhere receiving more detailed notice.

It goes without saying that the trade, more especially the export trade, is considerably disarranged, but in this respect we are by no means in so bad a position as is the case with our enemies and allies. The universal military service existent on the continent has meant many factories being largely depleted of their workers, including the technical and clerical staffs. In Great Britain numbers of men and a limited number of officers have been called from rubber works by the mobilization of the territorial forces, but in no case has the number of men withdrawn from any particular plant led to the stoppage of the works.

The position of affairs among rubber manufacturers generally is that while some firms are working practically round the clock to complete government orders, others, who are not in the list of government contractors, either because they do not make the particular classes of goods required or because of their limited size and status, are feeling the pinch of bad trade very severely. The government orders given out comprise ground sheets to form the tent floor, motor tires for transport wagons and ambulances, bed sheeting, elastic bandages, pure rubber sheet, etc., for hospital use, as well as larger orders for goods on the admiralty list, some of which are supplied to the government dock yards direct and others to the private shipbuilding yards. The goods mentioned above by no means include all which might be enumerated but they will suffice to show the trend of present activity in our large works.

As a set-off to this loss of export trade, we have the fact of short time being general in the cotton trade and in engineering establishments not supplying goods required in war. Again some collieries have closed down temporarily and others are on short time, owing to a decreased demand for coal for industrial purposes, as well as to a shortage of pit props, the arrival of which from Scandinavia has been delayed. The waterproof garment branch seems to be badly hit, houses in the trade working only two or three days a week; though the depression here cannot be attributed entirely to the war as it has been chronic for some time. Even now when certain branches of proofing should be busy from war demands there is great difficulty in getting the particular textile wanted, as owing to bad trade generally many textile mills shut down for a time some weeks ago, and they are not inclined to re-start for transitory orders of what they consider inconsiderable magnitude.

The rubber heel trade of the baser sort has been very decidedly affected, as so much of the business was done with the Continent. I am doubtful if there are any rubber goods, except perhaps rubber sponges, coming from the Continent which cannot be supplied at home. In the matter of hollow balls there is a convention regulating the price. It is understood that contracts with Germany and Austria are void, though opinion on the point is by no means unanimous. Conventions as to prices, however, are a different thing and will probably continue in force. Anyhow,

there is no reason why British makers should seek to raise the price, as rubber is plentiful enough, though one must not overlook possible difficulties in the case of certain chemicals.

A somewhat important article coming from Germany and Austria is the high temperature sheet packing, first produced by Klinger at Budapest and later made by himself at Berlin under the name of Klingerite. There are now several makers of this class of goods on the Continent with whom Turner Bros., of Rochdale, England, are competing with their Permanite. The foreign firms which have depots in England are, of course, in a bad way, as they cannot get supplies. Moreover the general public feeling against the purchase of German goods is such that resumption on the conclusion of hostilities is hardly likely to be attended with success. To enlarge somewhat on this issue it may be mentioned that active steps are being taken by the Board of Trade in conjunction with traders all over the country to devise means whereby the German export of a variety of goods to Great Britain can be more successfully met by home competition. Though a great deal has been written in the daily and technical press with regard to various products I have not noticed any reference to rubber goods, such as electric cable and tires. I propose to revert to this topic on a future occasion at greater length and will only remark that in our enthusiasm to reorganize our business relations with the enemy, it should not be overlooked that we send to Germany every year goods to the value of 100 million sterling.

PERSONALITIES AND THE WAR.

As already mentioned, the ranks of rubber workers have been depleted by the calling out of the Territorials and by those who have enlisted in the new army. Few statistics are available, but it is stated that in the case of the Dunlop Rubber Co. the loss of men from this cause amounts to about one thousand. Perhaps sooner or later some account may be compiled of what the leaders of the industry have done on the lines referred to in the following paragraphs:

Colonel R. K. Birley, C. B., of Charles Macintosh & Co., Limited, retired territorial artillery, has taken over the position of Director of Army Clothing for the East Lancashire Division Territorials.

Lieutenant-Colonel Fallows, of the Leyland & Birmingham Rubber Co., Limited, is in camp with his battalion of the Lancashire Fusiliers Territorials.

Captain J. J. Shannessy, of the Midland Rubber Co., Limited, Birmingham, is in camp with the Royal Warwickshire Regiment Territorials.

Mr. Isidor Frankenburg has contributed £500 to the National Fund for Relieving Distress.

Mr. J. F. Moseley, of David Moseley & Sons, is on the list of special constables for Manchester.

Major Birley, R. A., whose name occurred among the British wounded in France, is a son of Col. R. K. Birley.

RUBBER CHEMICALS AND THE WAR.

Many industries have been crippled owing to the stoppage of chemical supplies from Germany and elsewhere. The rubber trade comes in this category though it has not been affected to anything like the extent experienced in other industries, as it draws comparatively little of its requirements from the Continent. Of the more largely used fillers oxide of zinc has been scarce and has risen in price. The bulk of our supplies comes from Liège, a town which has recently made history. Here the oxide

is produced by the Vieille Montagne Co. by the combustion of metallic zinc. The zinc ore which at one time was largely produced in Belgium now comes mostly from the company's mines in Sardinia, Sweden, England, etc. The principal producers of zinc ore and metal are Germany and America, and a business arrangement to control prices by limitation of output has now for some years been in existence between these countries. As zinc is a constituent of brass its export has been forbidden by the belligerent countries, the present stock in England being under the control of the government. This does not apply to the oxide. French zinc oxide manufacture has made great strides in recent years owing to the anti-white lead agitation, and this oxide has found its way into many rubber works in competition with the Belgian. The production of zinc oxide in the chemical treatment of complex zinc-lead ores is now a large industry in America, but somehow or other the product has not found favor with British rubber manufacturers. The present situation may prove of utility to American interests though, as our present supplies do not come from Germany, I am not disposed to be enthusiastic over America's prospects.

I am in much the same frame of mind with regard to another important rubber chemical, sulphur, to wit, which in the crude form comes to us so largely from Italy, or Sicily to be more definite, a country whose neutrality has meant more to us than has that of America. Unfortunately for the rubber trade sulphur is contraband of war and supplies from Sicily have been seriously delayed, leading to a shortage in England and to a considerable rise in price. America is now, of course, a large producer of sulphur by the Herman Frasch process from underground deposits, and I have heard the topic of American supplies discussed. I believe, however, that the contraband of war difficulty arises here also. All the private gunpowder works in England are now taken over to some extent by the government, and it is hardly likely that rubber works can augment their stocks from this source. A fair quantity of sulphur is produced in England as a by-product from alkali ammonium sulphate and gas works and no doubt this will be drawn upon to a greater extent than is customary in normal times. There are also sulphur deposits in Spain which with some more capital and energy might make more noise in the world than they have done in the past. I may add with regard to sulphur from Sicily that shipments have been vetoed by the Italian government, though the ship owners were quite willing to carry parcels already on board.

With regard to other chemicals the great majority are made in England and the imports from Germany can easily be dispensed with. The requirements in carbonate and oxide of magnesia, for instance, can be easily filled by English makers. It is only close competition from German makers that has led to the by no means large import of the foreign-made article. Again, as regards red sulphide of antimony the original makers of this chemical for the rubber trade are still in business and no doubt the two or three British firms which specialize in this can easily fill all requirements. Barytes has been coming to us from the Continent, but both the carbonate and sulphate are mined in large quantities in the United Kingdom. The litharge which has been coming from Germany can easily be replaced by the home product. Carbon is contraband of war, and I don't know what the position is with regard to the high quality carbon black which comes from abroad, chiefly from America. The heavier vegetable blacks are obtained from British works.

Generally speaking the dependence of the rubber trade upon Germany is very insignificant compared with some other trades, and no stoppage of work need be apprehended. The laboratory will be affected, however, as so many chemicals and a considerable amount of apparatus came from Germany, and the chemical dealers are filling orders very sparingly from stock. There is plenty of rubber available, but as zinc oxide has been fetching £45 per ton no doubt certain goods will be advanced in price.

PROHIBITION OF EXPORTS

By a proclamation of August 5 the exportation of warlike stores from the United Kingdom is prohibited to all ports in Europe and on the Mediterranean and Black Sea, with the exception of the ports of our allies. The list of substances is a long one, but the rubber trade is only directly concerned with the following,—Asbestos, telegraph and telephone cables, articles of camp equipment, vulcanized india rubber sheet, engine and boiler packings and uniform clothing and military equipment. The india rubber sheet no doubt refers to that used by the admiralty, though, of course, military ground sheets would come in this category as well as in that of camp equipment. I have not heard of any case where business has been done contrary to this proclamation, though it is conceivable that errors of judgment might arise through ignorance of what particular goods go to make up camp and military equipment. Under these wide headings no doubt we have riding mackintoshes, "gum" boots, surgical and druggists' goods, cycle and motor tires, aeroplane fabric, etc., etc. Though Spain is not among our allies, the prohibition is not extended to its ports, so that if desired business in the above goods may be done with that country.

In addition to the above proclamation another one has been issued having reference to trading with the enemy, any new transactions being prohibited. Some orders from Germany which came in during August were promptly refused by British firms, though some little difficulty has been experienced in finding out whether orders from Holland are really intended for Germany. With regard to reclaimed rubber, in normal times we export a good deal to Germany but take very little from her, while a good deal of reclaimed comes from Russia and France. The general position is that while the export business for our reclaimers has declined or, more accurately, vanished, the home business has increased owing to the failure of foreign competition from the Continent.

INCREASED USES OF RUBBER.

Among the principal objects of study by rubber specialists in the earlier part of this year were various schemes for the extended utilization of rubber. Prominent among these was the plan of Messrs. Dessau and Morrison, of London, for the laying of rubber pavement, with a view to eliminating the noise of city traffic. Previous to the commencement of the present hostilities an English patent was secured for the system in question.

Under the auspices of the Rubber Growers' Association of London a company was formed with a proposed capital of \$150,000 for the purpose of exploiting this patent on the basis of plantation companies participating in the venture. It was proposed for them to furnish annually without charge during five years one-fifth of one per cent. of their output, in addition to a like further quantity at one shilling a pound. An aggregate output of 20,000 tons a year would have been sufficient to supply 40 tons free and 40 tons at the price named.

The financial situation has been changed by recent events, but the project will doubtless be taken up again later.

EXPECTED ADVANCE IN ENGLISH FACTORY PROPERTY.

Active measures are being taken by many English manufacturers to prepare for increased trade owing to the disturbed conditions on the continent. The fact is being recalled that the passing in 1907 of the English Patent and Designs Act was followed by marked activity in factory property, and similar conditions are anticipated as a result of the present complications. Reports from England state that firms in many branches of trade there are seeking factories in which to establish industries, from the operation of which they have in the past been excluded by the low quotations of foreign manufacturers.

THE BRITISH CENSUS OF PRODUCTION, 1907.

WHILE the report of the British Census of Production for 1907 has only recently appeared, its compilation has evidently involved considerable effort. Although modeled in a general way upon the American Census of Manufactures (which has been taken for 1899, 1904 and 1909), it is far more detailed. This is particularly the case with the rubber industry, in which the accessory trades have been separately shown; the items of "Miscellaneous Rubber Goods" and "Other Products" being of relatively small importance.

The total product of rubber goods made in British factories in 1907 is shown in Table A as equal to about 47 million dollars. To this amount should be added 34 million dollars, shown in Table B, for the production of nine industries reported separately as using some rubber, but which has not been segregated. The British production of rubber goods in 1907 was thus the equivalent of 80 million dollars, as compared with the reports of the United States Census of 1909, quoted by THE INDIA RUBBER WORLD in May 1912 (page 374), of 200 million for rubber industries, and about 125 million for accessory industries using more or less rubber.

It is of course probable that the amounts of production have since increased on both sides of the Atlantic, but the figures for 1909 and 1907 afford a basis of comparison.

COST OF PRODUCTION.

The cost of materials is shown, in respect to Table A, on a product of about 45 million dollars, as approximately 29½ million. This result equals about 66 per cent. on the value of output, or about 5 per cent. more than the average shown by the United States census of the rubber industry for 1909. The cost of material for the product of elastic webbing was about 60 per cent. of the value.

PERSONS EMPLOYED AND POWER USED.

In the various branches of industry shown in Table A, there were 21,556 wage earners and 2,483 salaried persons, making a total of 24,039. Of this number 23,424 were employed in factories with their own engines and 615 in workshops not using power. The power used by the former number represented 27,440 horsepower, distributed as follows: Reciprocating steam engines, 26,423; internal combustion engines, 951; water power, 42; other power, 24; total, 27,440 horsepower. The capacity of dynamos driven by reciprocating steam engines was 4,415 kilowatts and by other power 37 kilowatts, making an aggregate of 4,452. The amount of electricity purchased by the establishments whose product is shown in Table A was 613,000 Board of Trade units.

Altho in various instances the returns are not full in their details, the idea has been to make them of a more or less general character for the United Kingdom as a whole, so as to avoid the possible disclosure of particulars regarding certain firms.

Table A—British Production of Rubber Goods, 1907.

	Value in Dollars.
Waste and reclaimed rubber.....	\$685,000
Rubber compounds and solution.....	255,000
Rubber substitutes	270,000
Solid and insertion sheet rubber (including all articles for mechanical and industrial purposes).....	7,690,000
Machinery belting (including balata).....	680,000
Hose and tubing of rubber, with or without other materials	2,670,000
Engine packings	170,000
Pneumatic tires	11,490,000
Solid tires	2,680,000
Elastic thread, cord, etc.....	2,230,000

Waterproof piece goods, garments, boots, etc., not separately distinguished	6,575,000
Waterproof garments	3,620,000
Rainproof garments	230,000
Rubber heels	1,570,000
Golf and tennis balls and sports requisites, etc....	2,365,000
Hot water and air goods; medical, surgical and dental appliances	905,000
Miscellaneous rubber goods.....	2,835,000
Other products	450,000

Total of rubber manufactures.....\$47,370,000

Table B—Production of Goods Made Partly of Rubber, 1907.

ELASTIC WEBBING:

Braids and cords.....	\$3,315,000
Suspenders, belts, stockings, etc....	690,000
Other textile manufactures.....	360,000
	<hr/> \$4,365,000

ELECTRIC POWER AND LIGHTING CABLES:

Rubber insulation	6,500,000
Paper and bitumen insulation (some rubber used)	6,610,000
Other insulation (some rubber used)	3,645,000
	<hr/> 16,755,000

TELEGRAPH AND TELEPHONE CABLES:

Submarine	5,510,000
Land	4,045,000
	<hr/> 9,555,000

Waterproof apparel	1,475,000
Druggists' sundries	610,000
Rubber stamps and accessories.....	150,000
Reservoir pens and stylographs.....	270,000
Rubber manufactures produced by engineering and cycle firms	600,000

Total of goods partly of rubber.....\$33,780,000

BRITISH ELECTRICAL INVESTMENTS.

A table published in the last (eighteenth) edition of "Garcke's Manual of Electrical Undertakings" illustrates the development of English electrical investments during the last seventeen years. In 1896 there were 200 concerns, with an aggregate capitalization equaling about \$300,000,000; while the number of undertakings now reported on is about 3,000. The total capital outstanding in 1913-14 is said to represent about \$2,100,000,000 or seven times the amount in 1896. In both cases the figures include shares, debentures and loans, together with the borrowings of municipalities for electrical undertakings, but do not include the value of the government telegraphs.

HERMANN MÜLLER & CO. CHANGE TITLE.

Hermann Müller, of the crude rubber firm of Hermann Müller & Co., 21 Mincing Lane, London, was granted permission on August 25 to change his name to Harvey Christie-Miller, and a similar change has been made in the firm name, which is now Harvey Christie-Miller & Co.

The Dunlop Rubber Co., Ltd., of London, has declared the usual quarterly dividend on its 6 per cent. cumulative preferred shares.

The Sirdar Rubber Co., of London, has introduced a new non-skid tire in which the metal studs are flush with the tread, in zig-zag depressions in the rubber. The claim is made that a tire of this class, without the additional protector, needs less inflation and allows greater resiliency.

Some Rubber Interests in Europe.

THE LATE MR. JOSEPH FRASER.

THE funeral took place at Allendale Cemetery, Aberdeen, Scotland, on September 1, of Mr. Joseph Fraser, aged 62, long a prominent figure in the Ceylon planting community. His original experience had been in the application of fertilizers to tea, the large increase of yield per acre of late years having been largely due to his individual efforts. Subsequently he interested himself in rubber cultivation, in connection with which he repeated the successful results he had achieved with tea. Mr. Fraser was a director in fifteen companies operating in rubber, tea, coffee and coconut cultivation, including some of the most successful plantation concerns.

MR. C. A. LAMPARD ON SYNTHETIC RUBBER.

The ever-recurring subject of synthetic rubber was dealt with by Mr. C. A. Lampard at the recent meeting of the Rubber Plantations Investment Trust, Limited. He quoted the recent statement of an eminent rubber chemist to the effect that both of them would be in Heaven, or elsewhere, before the question assumed a practical shape. Mr. Lampard had taken up the position that as a commercial proposition it was impossible on the basis of cost. He likewise remarked that there was a distinct decrease in the receipts of the lower grades of wild rubber.

CONTINENTAL TIRES AND ENGLISH CUSTOMERS.

Soon after the declaration of war the Prowodnik Co. was obliged to call in its stock of goods in England. The tire made by this Russian company had made some headway in the British market during the last year.

The war has interfered with the receipt of new supplies by the Michelin English depot, but a fair business is reported by that company and other concerns in sales from stock. Owing to the partial stoppage of its French factory, the Hutchinson Co. has been unable to obtain further supplies from that quarter. They report having a supply of tires on hand sufficient for half a year's trade. Two of the directors are with the French army.

German tire manufacturers have been gradually depleting their English stocks. Disputes have arisen with some English customers as to the validity of their contracts with foreign houses, they claiming that their engagements are cancelled by the declaration of war. These discussions have been in most cases settled by the acceptance of the goods.

The Pirelli Co., of Milan, is in the fortunate position of having a good stock in London, while its manufacturing facilities are about to be increased by the opening of its new cable works at Southampton.

AFRICAN RUBBER IN THE LONDON MARKET.

The following information regarding the recent sales in African rubbers in the London market, has been sent to us by one of the prominent London rubber dealers.

"The African market here has been fairly steady during August and the beginning of September, 55 tons being sold during August and up to September 4. Assinee sheets and Strings were sold at 2s. [48.65 cents] per pound, *Elobes* Ball at 1s. 3d. [30.41 cents] per pound, Selected Gold Coast Lump at 1s. 1d. [26.35 cents] per pound, *Niger Gutta* at 9d. [18 cents] per pound, and *Accra Paste* at 8½d. [17.50 to 18 cents] per pound. Nine tons of *Lahon Cake* was taken up by a dealer here last week at 1s. 7½d. [39.53 cents] per pound, which had been in store for some considerable time. The reported destination was Russia. There is at present very little rubber offering in the African market, only two or three small parcels of old Benin and Lagos Lumps being offered, for which 1s. 3d. [30.41 cents]@1s. 4d. [32.43 cents] per pound, is asked. Heilbut's bid of 1s. 2½d. [29.39 cents] for 5 tons was refused.

LONDON AUGUST RUBBER STATISTICS.

London rubber imports for the eight months ended August 31 showed an increase as compared with last year from 19,699 to 27,274 tons, while the last two months exhibited a falling off from 3,418 tons in July to 3,091 in August. The last figures are chiefly of interest, because there is usually an increase of quantity at that period. Deliveries had, however, likewise fallen back from 3,225 tons in July to 2,810 tons in August, or to a somewhat larger extent than receipts. Meanwhile the total deliveries for eight months had grown from 18,723 tons a year ago to 26,972 tons, being in a larger proportion than the receipts. The London plantation stock had risen from 3,242 tons at the end of July to 3,523 at the end of August. The last named figure is said to be the largest since April last.

RUBBER GOODS OPENING IN ITALY.

In a report on the commercial conditions in Venetia, Consul James Vernor Long, stationed at Venice, states that football and lawn tennis, as well as other outdoor sports, are largely indulged in in that locality and that if American manufacturers could compete with the prices of other foreign houses and would give credit to dealers, they might find an opening for athletic accessories in the Italian market. He also believes there is an opening for the sale of rubber bedding for use in the hospitals on *Sacca Sessola* and *La Grazia* Islands.

The import duty is high, however, being \$15 per hundred pounds, and prices must meet those of the Italian articles in order to compete. Samples submitted should be accompanied by quotations which include all charges, in Italian currency, and measurements based on the metric system.

TRADE OPENINGS IN AUSTRALIA.

The opening of the Panama Canal and the war afford opportunities to American exporters for the extension of their Australian trade. In 1903 Australian imports of American merchandise amounted to \$28,886,278, of which \$24,347,732 was imported direct. The total imports from the United States in 1912 were \$52,384,257, of which \$45,986,239 went direct from American ports.

In 1912 Australia imported rubber manufactures to the amount of \$4,840,951, of which the United States only supplied \$551,832.

RUSSIAN RUBBER EXPORTS TO THE UNITED STATES.

Reports from the various American Consular Offices in Russia show the following exports from that country to the United States during the last two years:

	1912	1913
Balloons	\$2,110
Reclaimed rubber	\$26,347	536,974
Shoes	14,164
Sponges	8,446	8,548
Tires	20,977	78,367
Waste	510,846	242,722

Reports from the Odessa consular district state that American automobiles are becoming popular in southern Russia, where about 500 cars were sold in 1913, most of them at prices from \$1,288 to \$2,318. Sixty American cars were registered last year in the city of Odessa, where seventy-five cars were sold during the year.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

A FRENCH PROCESS FOR RECLAIMING FABRIC IMPREGNATED WITH CAOUTCHOUC.

WHILE this country has led the world in the matter of reclaiming rubber, little attention has been paid to reclaiming fabric which may be impregnated with caoutchouc. As an example of this may be mentioned the fabric in which tires are wrapped while vulcanizing, which fabric becomes impregnated with vulcanized rubber, but does not contain enough to make the rubber of importance rather than the fabric.

According to French patent No. 460,273, the fabric may be recovered by taking advantage of the properties of certain solvents to greatly swell the vulcanized rubber and thus loosen it from the fabric. The solvent mentioned as suitable is xylol, in which the fabric is soaked for two or three days.

Xylol is a constituent of coal tar and is recovered with the benzol, but its price is beyond reach for any such purpose as this as it sells for over a dollar a gallon and is now unobtainable, while even before the disturbance of the chemical market it was very scarce and in great demand. There are many other like solvents, however, that might be used. Coal tar oils and naphtha, turpentine, pine oil, and in fact all the rubber solvents possess this property, as is well known. C. O. Weber recommended naphthalene nitrate or nitro-naphthalene as a solvent for rubber in analytical work and this would probably be effective here. The idea is to get the cured rubber loosened if not dissolved from the fabric.

When this swelling has taken place and loosening is effected there are several ways of procedure given to separate the rubber and fabric. If there is considerable rubber it may be broken from the fabric. There still remains the rubber on the surface or which has been frictioned into the fabric itself. To free the fabric it is brushed preferably with metallic brushes, and for this purpose the machine shown in the accompanying illustration is used.

The fabric is fed into the machine from either end, between a spiked holding roll *A* and a metallic brush *B*. The brushes revolve at a higher speed than the spiked rollers and loosen the

rubber from the fabric. The finely divided rubber falls into a receptacle *C*, while the solvent vapors are drawn off by an exhaust fan through a pipe *D*, and subsequently recovered by condensation.

It is said that by the application of a water soluble solvent for the xylol, such as acetone, that the rubber will be reduced to powder and the xylol thus recovered. It is evident that if the acetone were in turn removed with water it would tend to further disintegrate the rubber, or if steam were introduced to distil off the acetone the same result could be accomplished.

Considerable stress is laid on the value of the recovered rubber powder, though experience convinces that this would not amount to much, but the profits of the operation would be from the recovery of the fabric if not entirely free from the

rubber stains, at least clean enough for re-use as vulcanizing cloth or tape.

This is a subject which may be of interest to some of the large consumers of fabric for the above purpose, as it cuts down costs a little by conserving the raw materials of manufacture; and even a slight saving is important in the present fierce competition, which results in the cutting of prices down in some cases to bare production costs.

RECENT STATUS OF THE GERMAN INSULATED WIRE INDUSTRY.

PRACTICALLY all manufacturing industries in Germany, including the different branches of rubber manufacture, are, for the time being, of course absolutely paralyzed, and it is impossible to tell how long this paralysis will continue or how complete the ultimate recovery will be. This makes it all the more interesting to review the conditions in any line of rubber manufacturing as they existed just prior to the outbreak of the war.

As an accessory branch of the rubber manufacturing industry, the manufacture of electric wire has been subject in Germany to similar influences. Its development has been to a certain extent simultaneous with that of the rubber industry, properly so-called.

Germany has displayed a marked advance in the production and export of insulated wire. The exports for the last eight years have been as follows:

EXPORTS OF WIRE COMPOSED OF BASE METAL, COVERED, WOUND, SPUN OR PLAITED: WITH SPUN THREADS IN CONJUNCTION WITH INDIA RUBBER OR GUTTA PERCHA:

	Tons.	Value Equaling.
1906	1,801	\$2,026,500
1907	2,192	2,716,000
1908	2,320	1,865,000
1909	2,570	1,573,750
1910	3,360	2,057,000
1911	4,731	2,892,250
1912	7,115	4,322,500
1913	8,394	5,430,250

The figures of 1912 and 1913 include wire with other insulation than india rubber or gutta percha, the amount of which is understood not to have been large. The fluctuations in value in 1908 and 1909 are regarded as due to the crisis of 1907 and its after effects.

The total German export of insulated wire for 1913 thus represented more than \$5,000,000, a similar quantity being absorbed by the German market. This aggregate output, exceeding in value the equivalent of \$10,000,000, was the production of 25 factories, some large and others small. As in other branches of the rubber industry, augmented consumption led to increased production, thereby inducing keen competition.

Under these circumstances, the natural result was the reduction of qualities, efforts having been specially directed toward economies in the various compounds. The results of such a policy aroused criticism; and not only was the reputation of German insulated wire assailed but also that of the German electro-technical industry generally. There was no way of economizing in the copper conductors. In fact, the situation of the copper market would have warranted an advance, a like condition prevailing as to cotton. Moreover, by reason of the existing socialistic tendencies, demands for higher wages were naturally to be expected. Compounds, the rubber in which was exclusively regenerated, or with a rubber content as low as 8 per cent, were by no means rare. Hence, if the entire insulated wire industry was to be prevented from falling into discredit, a change was unavoidable.

At this juncture the Association of German Electrical Engineers prescribed a definite composition for rubber com-

pounds. In these efforts the association had the support of the more important factories, while in conjunction with the Royal Material Testing Bureau, the manufacturers formed a technical organization for testing the qualities of the products in co-operation with the buyers. The result was that, when not otherwise stipulated, all wire coming on the market fulfilled the requirements of the German Association of Electrical Engineers.

This settlement of the technical question involved did not, however, work in practice. While the "Normal Compound" was to contain 33.3 per cent. of crude rubber, with a proportion of resin not exceeding 6 per cent., it was only stipulated as to added substances that not more than 3 per cent. of their aggregate contents should consist of ceresine. In this respect there was perfect freedom accorded the manufacturers, so that some low-grade compounds were produced, of which one containing 34 per cent. crude rubber, 2 per cent. sulphur, 2.5 per cent. ceresine, and 61.5 per cent. chalk, was not the worst. Prices dropped two years ago to a level without profit or even showing a loss.

A combination was then formed by several concerns, operating with extreme caution, so as not to attract competition by excessively high prices. Moreover, the fact was recognized that a specially large investment of capital is not required for establishing a plant of this description. Prices were therefore fixed on a scale which only included a modest profit for manufacturers. The idea was further developed in the fall of 1913 by the establishment of a syndicate, in the form of the "Selling Bureau of the United Manufacturers of Insulated Wire." This syndicate had to arrange the prices so as to cover the profits of the dealers, power plants and installation firms (which are all under heavy expense), in addition to a manufacturer's profit of about 10 per cent.

When it came out with its prices the syndicate soon found the effect of foreign competition. It was realized that the foreign manufacturer with an import duty amounting only 5 per cent. could underbid the German maker who was looking for a profit of 10 per cent. These conditions were to some extent due to the expressions of the German electrical engineers, when the tariff of 1906 was in preparation, to the effect that they wanted no protection, the German industry being, in their view, so well fortified that it was not threatened by any danger from abroad.

Meanwhile the establishment of factories outside the syndicate increased the competition, as various of the existing large rubber factories took up insulated wire.

Under these circumstances, it was reported, even before the outbreak of the European war, that the syndicate, in spite of its good intentions and cautious plan of operation, would be obliged to consider the question of dissolution on its expiry next December.

THE GERMAN EMPIRE AND ITS COLONIES.

AS will be recalled, the German Empire proper consists of twenty-five states with a total of 208,780 square miles and a population in the aggregate of 64,923,993. Of these the most important are:

	Square Miles	Population.
Prussia	134,616	40,165,219
Bavaria	29,292	6,887,291
Württemberg	7,534	2,437,574
Baden	5,823	2,142,833
Kingdom of Saxony	5,789	4,800,000
Hesse	2,966	1,282,051
Hamburg	100	1,014,064
Alsace-Lorraine	5,604	1,874,014
Total of eight principal states	191,784	60,610,307
Remaining seventeen states.....	16,996	4,313,686
Grand total	208,780	64,923,993

Out of the above grand total 28,092,117 persons were, according to the last census (that of 1907), engaged in the following callings:

Agriculture, cattle rearing, etc.	9,732,472
Forestry, hunting and fishing.....	150,785
Mining, metal works and other industries.....	11,256,254
Commerce and trade.....	3,477,626
Domestic and other service	1,736,450
Professions	1,738,530

Total in various callings

28,092,117

The remaining population of about 36 millions was composed of next-of-kin, without principal occupation and without income.

GERMAN IMPORTS AND EXPORTS.

The following table represents the German imports and exports for the last six years:

	Imports	Exports
1908	\$2,019,273,250	\$1,620,374,500
1909	2,215,102,500	1,714,673,250
1910	2,327,498,000	1,911,104,950
1911	2,501,736,250	2,056,095,000
1912	2,754,283,000	2,274,882,250
1913.....	2,673,750,000	2,478,150,000

GERMAN COLONIES AND DEPENDENCIES.

As compared with the area of the German Empire, 208,780 square miles, the colonies and dependencies of that country occupy, it is estimated, 1,027,820 square miles. Scattered over this wide extent of territory are about 24,389 whites and 12,041,003 natives. Thus there is about five times the area with about one-fifth of the population, of which only a small proportion consists of whites.

In 1912 German imports from its colonies equalled \$13,225,000 while German exports to the colonies represented the equivalent of \$14,325,000. During the same year Great Britain's imports from the same source were equal to \$2,954,995 and exports to that quarter \$3,477,105.

German colonies are located in Africa, Asia and in the Pacific, according to annexed table:

STATISTICS OF GERMAN COLONIES.

	Estimated Area	Population
	Square Miles	
Africa.....	33,700	1,632,346
Togo	191,130	2,500,594
Kamerun	384,180	7,651,106
German East Africa.....	322,450	9,438,000
German South West Africa.....	931,460	11,428,429
Total African possessions.....		
Asia.....	200	168,000
Kiauchau		
In the Pacific—		
GERMAN NEW GUINEA:		
Kaiser Wilhelm's Land.....	70,000	
Bismarck Archipelago.....	20,000	
Caroline Islands	500	601,427
Palau or Peleu Island	250	
Marianne Islands	4,200	
Solomon Islands	150	
Marshall Islands, etc.		
SAMOA ISLANDS:		
Savaii	600	
Upolu	340	35,136
Total Pacific possessions.....	96,100	636,563

	SUMMARY	
Africa.....	931,460	11,428,429
Asia	200	168,000
Pacific	96,100	636,563

Grand total

1,027,820

The proportion of white population in the three divisions is: Africa, 22,405; Asia, none shown; Pacific, 1,984.

In area the German colonial possessions are about one-fifth of the United States.

Some Rubber Planting Notes.

CEYLON CONSOLIDATED RUBBER ESTATES, LIMITED.

ACCORDING to details submitted for the year ended March 31, 1914, there were in the above estates 1,166 acres in cultivation, on which there are 142,731 Para rubber trees, above one half of which will be in bearing this season. In addition there were approximately 200,000 Ceara trees, now tappable. More trees are coming into bearing than the estimate for 1914-15 was based on. The visiting agent's report gave an estimate for 1914-15 of 48,250 pounds of Para, being 100 per cent. over the original estimate, while he believed he could get 20,000 pounds of Ceara rubber in six months' time. Up to March 31, 1914, a year's crop of 18,000 pounds dry rubber had realized 2s 1d (50.68 cents) per pound.

PROSPECTS OF PLANTATION RUBBER INDUSTRY.

In discussing the above subject the "Home and Colonial Mail" of London remarks that the outlook for the plantation rubber industry is very reassuring, although there is considerable uncertainty as to the future of crude rubber generally. In the first place, Para business, on account of its close relations with London finance, will be seriously crippled by the war. Then African trade, largely in Belgian hands, is normally centered in the Antwerp market, at present a negligible quantity. Again, there is the difficulty to be anticipated by planters in financing their crops, notwithstanding the measures taken by the Straits government and the readiness of Ceylon bankers to finance the rubber of their own trading community. A certain curtailment of supplies must therefore be looked for.

The question is then: will there be a corresponding restriction in consumption? On this subject it is remarked:

"This is a difficult question to answer. Fortunately, however, for the rubber industry, the chief center of manufacture is a country far removed from and not directly concerned in the war. America consumes roughly one-half of the total world's production of rubber and for the present that country, together with ourselves, Italy and Japan will have to meet the demand for manufactured goods for the entire world. With the main source of supply under British control, there should be little difficulty in keeping both sides of the industry going with advantage to ourselves."

GROWTH AND QUALITY OF COCHIN CHINA RUBBER.

The last issue of the "Annals of Indo-China Rubber Planters" states that it is generally admitted that Sumatra is the country in the Far East where *Hevea Brasiliensis* grows most rapidly. The Malayan Peninsula holds second place, while several authorities give Cochin China a rank equal to Java and far in advance of Ceylon.

In the opinion of Mr. H. N. Ridley, formerly director of gardens and forests in the Straits Settlements, Cochin China is six months behind Malaya, but this disadvantage is offset by the complete absence of diseases in the former country. While admitting this backwardness in young trees, the "Annals" urges that trees seven to eight years old, though still in relatively limited number, are of the same height and circumference as those of neighboring countries. Even in the opinion of foreign experts *Hevea Brasiliensis* has a normal growth in Cochin China and its yield in dry rubber is of excellent quality. Moreover, the product of the Belland and Suzannah plantations sells in Paris on a par with first latex.

A further proof of the character of Cochin China rubber is contained in the fact that at the Ghent Universal Exhibition of 1913 a prize was awarded for the collective exhibit of that country, including rubber from the Ong-yem (Government), Phu-Nhuan (Belland), Suzannah and Natrach plantations.

POSTPONEMENT OF THE BATAVIA RUBBER EXHIBITION.

In consequence of the European complications, the Rubber Exhibition at Batavia, Java, has been postponed. It had originally been scheduled to open on September 7.

PROPOSED NEW RUBBER TESTING STATION FOR WEST JAVA.

Advices from Bandung report that a meeting of important planters has been held there, with the object of establishing a new rubber testing station for West Java at Lampongs. Considerable interest has been manifested in the project and confidence expressed in the prospects of its success.

PONTIANAK RUBBER COMPANY'S SHIPMENT SEIZED.

At the recent London meeting of the Pontianak Rubber Co. Mr. L. Davidson, who presided, stated that the directors were passing through an anxious time on account of the war. Their last consignment had been despatched to London by a German ship, which was seized by the Belgians at Antwerp. Representations had been made to the authorities at that port, which, it was hoped, would result in the liberation of the shipment.

SUMATRA CONSOLIDATED RUBBER PAYS FINAL DIVIDEND FOR 1913-14.

At the meeting on August 10 of the Sumatra Consolidated Rubber Estates, Limited, the directors were authorized to pay the final dividend for 1913-14 on a date to be fixed at their discretion. In sending the warrants at the close of the month it was stated that they were enabled to take this course as the company's business had then resumed more normal conditions.

COLOMBO AND THE WAR.

During the cessation of the Colombo weekly tea and rubber auctions fairly extensive private sales were effected, in which reasonably good prices were obtained, there being, however, more demand for tea than for rubber.

The absence of competition and the cost of war risk insurance in other than British bottoms have increased the demand for space on board English vessels. On account of the extra charges thus incurred, many shippers have been more than usually cautious, and as a result a quantity of rubber is said to be still held back.

FINANCING OF NETHERLANDS INDIES PLANTATION SHIPMENTS.

It is reported that the Dutch authorities in the East have made arrangements for securing the local banks in Java and Sumatra for the advances they contemplate making to facilitate shipments of rubber. Advances up to 9d. (18.24 cents American currency) per pound for rubber produced on the estates will be guaranteed. Advances on title deeds are likewise guaranteed, restrictions as to mortgages in Sumatra having been removed. Estates compelled to reduce expenses will be assisted in sending their coolies back to their respective countries. The opinion entertained in London is that the arrangements made will enable all properly managed and soundly financed estates to weather the storm.

BAMBRAKELLY (CEYLON) TEA AND RUBBER CO., LIMITED.

This company has increased its yield of rubber from 16,540 pounds in 1910-11 to 133,955 in 1913-14 (from 765 acres), the estimate for 1914-15 being 165,000 pounds. With a cost f. o. b. of about 1s. 5d. (34.46 cents) per pound, and a net average realized of about 2s. 2¾d. (54.22 cents) per pound, a dividend for the year ending March 31 of 8 per cent. has been declared.

An interesting feature of the report received is an adhesive label attached to the cover with the following request: "When ordering motor tires, hot water bottles, tennis shoes, garden hose and other goods made from rubber, please make a point of stating that you wish them to be of plantation rubber."

This request is part of the campaign being conducted by the companies on behalf of plantation rubber.

RUBBER AND COCOANUT PLANTING IN MALAYA.

STATISTICS for 1912 and 1913, reported by Mr. Lewton-Brain, Director of Agriculture, Federated Malay States, show an increased acreage under rubber of about 10 per cent., and an area one-third higher than before in cocoanuts. The exact figures are:

ACREAGE IN FEDERATED MALAY STATES

	1912.	1913.
Rubber	399,197	433,324
Cocoanuts	30,308	40,175
Coffee	8,669	7,995
Other cultivation	3,068	4,133

The preponderance and growing importance of rubber in the Federated Malay States is thus illustrated. Coffee and sugar planting show a decline, the latter having practically gone out in various districts.

While the above table deals with the Federated Malay States alone, another return for the whole of the Malayan peninsula is of special interest.

STATISTICS OF MALAYA

	1912.	1913.
Estates	1,055	1,151
Acreage in possession.....	1,498,282	1,622,231
Acreage planted	621,621	708,545
Rubber alone	587,874	682,613
Rubber interplanted with catch-crops..	33,748	25,932
Acreage producing	165,566	213,459
Planted during year.....	85,903	86,924
Output	18,956.8 tons	28,169.16

STATISTICS OF MALAYAN PENINSULA, 1913.

	Acres Planted.	Output. Tons.
Federated Malay States.....	433,324	21,229.17
Straits Settlements	111,316	6,047.14
Johore	117,022	1,645.70
Kelantan and Kedah.....	45,373	246.18
Trengganu	1,510	not yet producing
Total	708,545	29,168.19

ESTATE LABOR.

The total number of laborers in 1913 was 282,354, as compared with 255,912 in 1912. Of the later year's number nearly 75 per cent. were employed in the Federated Malay States, the remaining 25 per cent. being distributed through the other parts of the peninsula.

RUBBER IN JAMAICA.

While dealing with the various other agricultural features of the island, the annual report of the Department of Agriculture, Jamaica, for the year ending March 31, 1914, contains several references to the cultivation of rubber. Jamaica, as will be recalled, has an area of 4,200 square miles, and the most successful variety of rubber for cultivation has been *Castilloa*. The distribution of plants for three successive years has been: 1911-12, 22,745; 1912-13, 5,878; 1913-14, 2,667. Most of these plants went to small settlers, with whom their growth has been satisfactory, but owing to the drop in the price of rubber from 12s. per pound in 1910 its present value of about 2s., the opinion is expressed that few crops are at present raised in Jamaica with so meagre a financial return as that indicated for *Castilloa* rubber. Tapping of eight-year old *Hevea* was unsatisfactory and is said to have confirmed the view that *Hevea Brasiliensis* is not suitable for commercial cultivation in Jamaica, where any capital invested would have been lost.

Virgin rubber (*Sapium tolimense* Kunth), owing to the length of time required to ripen, seems to have given results of a disappointing character.

The reports of the various public gardens in Jamaica constitute a feature of interest, as showing the progress being made in various forms of agriculture in the island.

EASTERN AND WESTERN AGRICULTURAL COLLEGES.

The claims of Ceylon as the site of the proposed Imperial Agricultural College have been urged by Lord Curzon, Governor both in the colony and at home. At the recent conference of Tropical Agriculture the choice of Ceylon was advocated by Professor William R. Dunstan. In this connection the report attaches to a paper prepared for that occasion by Mr. J. H. Smith, the editor of "Tropical Life," in which he refers to his suggestion of April, 1913, for two colleges to cost £10,000 each, three at £75,000 or four at £55,000 each. The aggregate cost of these colleges, Mr. Smith estimated would not exceed 10 per cent. of that represented by a Dreaming Machine. Taking Professor Dunstan's later estimate of £50,000 as the prospective outlay for a Ceylon college the writer remarked that it should be duplicated in the West, where he advocated the establishment of another college in the West Indies.

Such an institution, it was added, could train men to go to West Africa to take up the Imperial work of forestry, as had been done with men trained at Trinidad who were better able to cope with local African conditions than if their education had been in the East.

At the same time Mr. Smith advocated sending to the East those embryo planters who were looking towards that quarter of the globe, adding:

"I am not urging the claim of the West Indies in competition with Ceylon. . . . On the contrary, if *pro tem*, there is to be only one college, then I agree that Ceylon should have it, but . . . our welfare as a trading nation . . . renders it quite as important that we should establish a college in the Western hemisphere as it is that we should have one in the East."

TRADE OF GERMAN EAST AFRICA.

The imports of German East Africa during the four years 1909 to 1912 equaled, respectively, \$8,078,125, \$9,200,790, \$10,920,790 and \$11,973,580, the trade being chiefly with Zanzibar and Germany. Exports principally consisted of rubber, copra, ivory and sisal; the amounts for the respective years representing \$3,122,435, \$4,951,685, \$5,340,185 and \$7,478,575.

According to the report of the Department of Commerce and Labor of February 28 last, wild and plantation rubber together occupy the leading position in the exports of the colony, the production of the former kind tending to decrease while the latter is rapidly growing in importance, having been taken up on a large scale by Europeans in the Kilimaniaro district west of Dar-es-Salaam and in the southern coastal area.

While *Kickxia*, *Castilloa*, *Hevea* and *Ficus* have been tried, the greatest success has been with *Manihot Glaziovii*. Exports of all kinds of rubber increased from 531,460 pounds, valued at \$264,910, in 1908, to 2,653,035 pounds, valued at \$2,005,436, in 1912. These figures indicate an increased production of the more valuable plantation variety of rubber.

The report of the British Consul at Dar-es-Salaam speaks of the setback which the rubber industry had experienced through the fall in prices which occurred in 1913, there being probably 19,000,000 trees planted in the colony of which about half were ready for tapping. Efforts have been made to meet the situation by the reduction of railway and ocean freights as well as by the abolition of import duty on the acids used in coagulating rubber.

By the latest accounts a slight improvement in the value of rubber had led, prior to the outbreak of the war, to the resumption of tapping by some planters. The German Colonial Economic Committee had been taking steps to introduce a standard quality of East African rubber, the absence of which has impeded the operations of planters. It is added that there is only one large washing and curing factory in the colony, at Muhesa, though several smaller ones exist at Usambara, the planters being obliged to wash the rubber themselves. This fact requires it to be again washed in Europe.

NOTES FROM BRITISH GUIANA.

By Our Regular Correspondent

WONDERFUL WEATHER UNPRECEDENTED YIELD IN BALATA EXPECTED

THE weather for August and September has been most remarkable. The rainy season is apparently not yet at an end, for plentiful and vigorous showers are still falling, and after some years of drought it will be understood how very welcome this state of affairs is, when it is stated that ordinarily the rainy season is at an end by the first of August. In the dry months the balata trees refuse to yield any latex, so that the present weather conditions are very much appreciated by the balata interests. There is every prospect of a bumper yield of balata this year.

Unfortunately, the cost of production is likely to be greatly increased on account of the higher prices of foodstuffs as a result of the war in Europe. Prices at once began to soar and the position became so serious that the government had to step in and fix maximum prices. Nevertheless, the prices fixed by the government are a good deal higher than normal. An even more serious trouble is the demoralization of the rubber and balata market in London and the apprehension that is felt of risking the shipment of large quantities of balata. A gentleman largely interested in the industry points out that there are large quantities of balata lying here, the proceeds from which are needed in circulation, but that the banks will only advance on it at a rate of interest of 6 per cent., and holding at the owner's risk, or if the balata is shipped the owner must pay the extra war risks. The banks cannot be blamed for taking this attitude. They cannot be expected to incur all the risks in handling balata for the sheer delight of assisting somebody else. The gentleman who has raised the question, however, wants to know why the government should not advance the money, take over the risk, and when the balata is released give the balance over to the owners. The simplest way out of the difficulty, of course, is to ship the balata and pay war risks, but the demoralization of the market is a serious obstacle.

The same difficulty is being experienced in the gold and diamond industries. I understand that the government is giving the matter the most serious consideration. It need scarcely be added that in the event of these colonial produce values lying dormant for some time there will be a small army of laborers making themselves very unpleasant on account of their wages. The government, however, has handled the affairs of the colony in so masterly a manner since the war broke out that it is not anticipated that this question will present any serious difficulties.

THE CUSTOMS REPORT FOR A RECORD YEAR FOR BALATA.

The report for 1913 of the Comptroller of Customs, which has just been issued, shows that a record amount of balata was exported last year. The figures for the past five years are as follows:

	Pounds	Value
1909-10	1,034,076	\$468,035
1910-11	1,162,588	670,192
1911-12	1,152,410	707,284
1912	705,214	407,424
1913	1,323,609	768,463

From the figures it will be seen that rubber has not made such good progress, although in the next few years we may confidently look for markedly better results.

	Pounds	Value
1909-10	6,366	\$3,123
1910-11	1,157	900
1911-12	3,474	3,119
1912	216	143
1913	1,340	822

The balata crop of 1913 was exported to the following countries:

	Pounds.	Value.
United Kingdom	1,191,359	\$687,435
United States	130,212	79,601
Germany	2,038	1,427

The comptroller says in the body of his report:

"The quantity of balata exported during 1913 was nearly double the quantity sent out of the colony the previous year. The increase amounted to 618,395 pounds, the rise in value being \$281,039. The total exports of balata for 1913 were 1,323,609 pounds, represented by a value of \$768,463. This is the largest amount of colony balata, both as regards quantity and value, that has been exported in any one trade year. The drought in 1912 retarded work in the up-country balata areas, and the state of the rivers in that year prevented a certain quantity from reaching Georgetown in time for exportation in 1912, so that the exports for 1913 were unduly inflated. Nevertheless the amount actually collected in 1913 was larger than in any former year. Unfortunately the price of balata fell considerably during 1913, and so the producers did not profit to the same extent as it was hoped they would with the increased yield. Balata is used for cables, golf balls, molds for electrical purposes, etc., and it would seem as if its price was regulated to some extent by the price of rubber, as the price fell in sympathy with that of rubber."

PROGRESS IN THE RUBBER INDUSTRY—TAKING PLACE OF OTHER CROPS.

Mr. E. H. S. Floyd, Canadian Trade Commissioner in the West Indies, says in a report which has just been submitted to the Canadian Department of Trade and Commerce: "The balata industry in British Guiana is on the whole in a healthy condition, though the product is being sold at cost price. The area covered in the cultivation of balata is being extended; estates that were previously under coffee, cocoa, fruit trees and sugar cane are now being utilized for rubber. An economical method of bringing an area of rubber up to bearing and one that is fairly general among the planters is to plant in catch crops among the young rubber and in this way reduce to a minimum the outlay necessary in the period required to bring the young trees to maturity. Considering the low price of labor in the colony it is believed that the areas now being extended will produce rubber at a price which will be remunerative, however low the ruling market price may be."

RUBBER SHIPMENTS FROM AMAZON VALLEY.

In a recent statistical return Consul George H. Pickrell, at Pará, showed the aggregate shipments of Brazilian rubber for the crop year ending July 31, 1914, as having been: To the United States, 40,936,545 pounds; to Europe, 44,707,700 pounds; total, 85,644,245 pounds. This total compared with those of previous years gives the following result, in pounds: 1912-13, 94,525,065; 1911-12, 89,957,410; 1910-11, 73,927,605; 1909-10, 86,178,685. The total for the last crop year was only slightly below the average of the last five years and only 9.4 per cent. below the figure for 1912-13. A more extensive falling off had been anticipated.

THE LATE PRESIDENT PENA.

The death on August 9, after protracted suffering, of Dr. Roque Sáenz Peña, President of Argentina, evoked many expressions of regret. He was elected in March, 1910, assuming office on October 12 of the same year, his term as president extending until 1916. Owing to his serious illness he had been of late replaced in the exercise of his duties by the Vice-President, Dr. Victorino de la Plaza.

His earlier experience had been as representative of his country at various international congresses, and likewise in a diplomatic capacity at several European courts.

Recent Patents Relating to Rubber.

THE RUBBER SCRAP MARKET.

WHILE the earlier part of August in the waste market reflected the disturbed conditions in the sales of the crude article, the closing days of the month saw an improved demand with advanced prices. In the first days of September, however, there was some reaction, owing to reclaimers delaying operations in scrap. Still it was generally considered only a question of time when they would resume their normal attitude as consumers of waste.

Thus reclaimers were successful in establishing a lower range of prices for the raw material of their industry. Most large operators were firm in their views, but some of them accepted reduced prices for shoes in limited quantities. Towards the middle of the month, dealers were purchasing shoes more freely, being obliged to pay 6½ cents and offering as low as 6¼ cents for large lots. Owing to their difficulty in procuring supplies of shoes, many dealers were towards the close of the month holding them firm at 7¼ cents, though business with reclaimers was in some cases effected at 7 cents to 7½ cents.

In auto tires, business at the commencement of the month was completely stagnant, the offerings of holders at 5¼ cents meeting with no response from buyers. Manufacturers claimed to have been able to purchase auto tires on the basis of 4½ cents, but this report lacked confirmation, that price having in fact been lately paid by dealers. At the middle of the month, similar conditions prevailed, the market for tires being without animation, and the business done ranging from 4½ cents to 5 cents. Later in the month reclaimers maintained that they could supply their requirements in auto tires at 5 cents and had in some cases offered 4¾ cents. Dealers were themselves offering 4½ cents, but found that price failed to attract quantities. No. 1 inner tubes could be purchased early in the month by consumers at 27 cents, while dealers were willing to buy at 25 cents. By the middle of the month, it was hard to find buyers at from 26 cents to 27 cents, and at a later period 24 cents to 25 cents was quoted, while dealers were willing to purchase in fair quantity at 24 cents for No. 1 and 14 cents for No. 2.

Early in the month small lots of bicycle and solid tires were taken by manufacturers at respectively 3 cents and 5 cents.

Colored scrap is not in demand, while hose is reported quiet at nominally unchanged prices.

Two lots of scrap hose were sold about the middle of the month by the Panama Railroad at New York prices. One lot consisted of 2,562 pounds No. 1 scrap hose at 16¢ and 6

brake and signal hose, and boots and shoes without leather soles, realizing 28¢ cents per pound. Another lot of 49,264 pounds No. 2 scrap hose included steam, water and pneumatic hose, bringing 75 cents per 100 pounds. S. Birkenstein & Sons, of Chicago, were the successful bidders.

Philadelphia reclaimers have been closely watching the situation, business having been light. At Boston there was a lack of important transactions, but the position of dealers was firm. Chicago manufacturers have been limiting their purchases to actual requirements.

NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS.

The annual meeting of the above association took place at the Hotel Astor, New York, on September 15, President Birkenstein, of Chicago, being chairman. There was a large attendance in the various sections.

SCRAP RUBBER.

The Gordon Rubber Co., of Chelsea, Massachusetts, incorporated August 4 with a capital stock of \$10,000, will deal in scrap rubber of all descriptions.

H. L. Seigel, formerly with Max Goodman, of Chicago, has opened a warehouse at 1446-8 South Morgan street, where he will deal exclusively in all grades of scrap rubber. He has associated with him in business David Klein, for a number of years past with the firm of J. Klein & Son.

The Scrap Rubber Dealers' Club, most of whose members are also members of the National Association of Waste Material Dealers, held a meeting at the Hotel Astor, New York, on Tuesday, September 15.

Arno Samson, proprietor of the New Jersey Rubber & Metal Co., of Newark, New Jersey, announces that an additional building, 50 x 100 ft. in area has been taken at 165-7 South Canal street, that city.

An additional meeting of the New Jersey Scrap Rubber Dealers' Club, of Trenton, New Jersey, will be held on October 6.

In this city, a lot of scrap hose was sold by W. J. Birkenstein, of Chicago, on August 27, to S. Birkenstein & Sons, of Chicago, at 75¢ per 100 pounds. The lot consisted of 1375 pounds of No. 1 and No. 2 scrap hose, and 100 pounds of No. 3.

Review of the Crude Rubber Market.

THE month of September continued the reaction from the sudden advance in rubber prices which marked the early part of August. Starting in August 1 at 70/71 cents, a sharp advance on August 5 brought the nominal quotation to \$1.07/1.10, subsequently touching \$1.25 on 14th. At that point a decline set in, which by September 1 had reached 77/78 cents, and by September 14, 69/70 cents, or slightly below the price on August 1. Following a similar course, the market has since dropped a further 6 per cent.; the rate on September 26th being 65/66 cents. This situation has been attributed less to any pressure of supplies than to the abstention of buyers, which last-named feature is expected to lead ere long to the depletion of manufacturers' stocks and their consequent renewal. On the other hand, there has been a feeling that the demand for high-class rubber goods is likely to diminish somewhat, with the result of a reduced demand for fine rubber. The statistical position of Pará is strengthened by the fact that English imports of that description for the eight months ended August 31 last were only 10,000 tons as compared with 12,862 tons for the corresponding period of 1913.

Plantation rubber imported by England from the three principal sources (Straits Settlements, Federated Malay States and Ceylon) aggregated during the above-named eight months 24,122 tons, against 19,399 tons for the corresponding months of last year, thus showing an increase of about 25 per cent. as compared with a falling off to about the same extent in the English imports of Pará. While the shipments of rubber from the East were more or less affected by financial disturbances, the fact that quantities of plantation rubber afloat were reported as, respectively, 8,250, 8,250 and 8,000 tons at the end of March, April and May, falling only to 7,500, 7,500 and 7,650 for June, July and August, indicates that shipments had not yet been appreciably reduced, up to the date of most recent advices.

Tracing the course of plantation prices since August 1, they will be found to have in a great measure reflected the movements of fine Pará rubber. Quotations, it will be recalled, had advanced from 56/57 cents on August 1 to \$1.08 on August 5, receding on August 17 to 90 cents. Since then they have steadily dropped.

For fine Pará the highest price of the month (77/78 cents) was attained on September 1 and 2; the lowest point (65/66 cents) was reached from September 18 to 25.

Plantation reached the highest point (65 cents) from September 4 to 8 and the lowest (56/57 cents) from September 17 to 22.

The results of the war are shown by the fact that English exports of rubber for August were only 1,715 tons, against 3,587 in July, 1914, and 3,912 in August, 1913, indicating a falling off in continental demand. Aggregate English imports of rubber for the first eight months of 1914 were 44,427 tons, as compared with 46,421 for the corresponding period of 1913, the loss in the Brazilian and African quantities being more than offset by the increase in plantation rubber.

An auction of 300 tons plantation was held in London on August 27 which opened fairly, but displayed a falling off

equaling 6 cents per pound towards the close. It had been contemplated to hold another sale towards the close of September, but this has been postponed.

Since the Amsterdam rubber sale of July 29, of 270 tons, no further auction has been held. The dates of the next sales at that port, and at Rotterdam and Antwerp have not been fixed. Business at Antwerp and the other continental centers is considerably affected by the war.

At the Singapore auction of August 12, only 8 tons were sold out of 63 tons offered. Most of the regular buyers were out of the market, in the absence of orders from Europe.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During September money market conditions as regards commercial paper have not changed much from those prevailing the latter part of August, as reported. Banks in this city have been almost entirely out of the market, and out-of-town banks have been only small buyers, with rates ruling at 7 1/2 to 8 per cent. for the best rubber names and 8 1/2 to 9 per cent. for those not so well known."

Plantation Rubber from the Far East.**EXPORTS OF CEYLON GROWN RUBBER**

(From January 1 to August 27, 1914, and for the corresponding period of 1913.)

	1913.	1914
To Great Britain	7,127,486	9,867,203
To United States	3,814,932	5,255,053
To Belgium	2,114,687	2,936,870
To Australia	321,249	339,603
To Japan	151,572	215,100
To Germany	138,152	1,037,415
To Italy	36,507	1,772
To Austria	27,946	
To Straits Settlements	20,064	42,535
To Holland	992	
To India	881	1,050
To France		250,712
To Russia		105,212
Total	13,754,468	20,052,525

(Same period 1912 6,957,230, same period, 1911—3,128,993.)

The export figures of rubber given in the above table include the imports re-exported. (These amount to 2,538,771 pounds—2,043,168 pounds from the Straits and 483,979 pounds from India.) To arrive at the approximate quantity of Ceylon rubber exported to date, deduct the imports shown in the import table from the total exports.

TOTAL EXPORTS FROM MALAYA

(From January 1 to dates named. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

	Singapore July 16.	Malacca July 31.	Penang, June 30.	Port Swet Tenham, July 31.	Total

PARALLEL BETWEEN WASTE RUBBER AND RAGS

In discussing the possible competition between synthetic and waste rubber the "Produkten-Markt" of Berlin states that if a really suitable synthetic rubber is produced, the rubber waste trade will not be killed but must expect a considerably lower range of prices. Similar conditions prevailed 35 years ago when wood-pulp was introduced in competition with rags and the rag dealers became alarmed at the prospect. Yet the rag trade is not dead, though the wood-pulp industry is prosperous.

Reference is made to an American statement to the effect that the rubber waste trade has never been so large as during the last few months, although prices have receded.

Vol. 51.

October 1, 1914.

CANADIAN NOTES.

The Beaver Tire & Rubber Co., Ltd., has been incorporated with a capital stock of \$555,000 and will operate a plant at Calgary, Alberta, for the manufacture of tires, etc.

A by-law has been passed at St. Catharines, Ontario, by which the Marathon Rubber Co., of Akron, in return for the erection and operation in the former city of a plant costing at least \$50,000 and employing at least 100 operatives at the start, is to be granted a five-acre site and a fixed assessment of \$10,000 for ten years.

The J. F. Holden Rubber Co., of 699 Yonge street, Toronto, Ontario, has been appointed Canadian agent for Diamond tires.

The Gutta Percha & Rubber, Ltd., has been granted a permit for the erection of a factory on West Lodge avenue, Toronto, Ontario. Work on this plant—which is to be of steel and brick construction and to cost in the neighborhood of \$100,000—will probably not be started for some time.

DOMINION SYSTEM EMPLOYEES MAKE PATRIOTIC CONTRIBUTIONS.

Each employe of the Dominion Rubber System—which comprises the twenty or more branches and warehouses of the Canadian Consolidated Rubber Co., Ltd., and its factories in Montreal, Granby and St. Jerome, Quebec, and Berlin and Port Dalhousie, Ontario—will contribute one day's pay to the Canadian National Patriotic Fund for the assistance of dependents of soldiers in the field and on active service. As none of the factories of the System, which employs several thousand persons, have been shut down owing to the war, but rather are in some cases working ten hours a day instead of eight, the contribution will probably be a large one.

RUBBER PROSPECTS FROM AN ENGLISH POINT OF VIEW.

English investors are reported to be holding their rubber shares, except in cases where they are obliged by circumstances to realize. The opinion is generally entertained that such investments are on a better basis than they occupied before the war, owing to the various factors in operation.

Discussing the question of a possible shortage, Mr. H. N. E. Longworthy, chairman of the Mincing Lane Share Brokers' Association, has expressed the opinion that, in view of the reduced supplies of wild rubber to be anticipated, the falling off from that source will be a heavy one. That consumption is being maintained was shown by the fact that for the first week of September, English landings of plantation rubber had been 832 tons and deliveries 791 tons, the present London stock of plantation being 3,638 tons against 3,145 tons a year ago. This situation, in spite of the war, he regarded as decidedly satisfactory. Other features imparting strength to the market were the activity of the industry in America and in the north of England. In the latter quarter many plants are working to their full capacity.

Very few industries have received such help as has been afforded rubber planters through the action of the governments of the Malay States and the Netherland Indies in facilitating the shipment of rubber by the necessary financial arrangements.

A CEYLON CONTINGENT FOR THE ENGLISH ARMY.

At a recent meeting of the Ceylon Association, of London, it was stated that nearly a hundred applications had been registered for the proposed contingent of Ceylon men then in England. With regard to those enlisting, a resolution, proposed by Mr. C. A. Talbot and seconded by Mr. Arthur Lampard, was unanimously adopted, recommending all proprietors and directors of companies to allow enlistees half pay for six months, and to let them resume their employment at the close of the war. The question was, however, subject to reconsideration in the event of the hostilities lasting more than the above-named time.

THE TEST THAT TELLS

Ten or Fifteen years' continuous service without interruption for repairs has often been obtained with Bristol Recording Instruments. The unique simplicity of construction of

RECORDING INSTRUMENTS

is responsible for their great durability and reliability in long continued service.

Take the case of Bristol Recording Gauge, Model 10, Serial No. 4038, which was shipped August 25th, 1900, and never returned for repairs until December 1st, 1913, when this recorder was found to be in fine working order except for replacement of the inking pen.

TABLE OF CONTENTS ON LAST PAGE OF READING.

SOME SPECIAL FEATURES IN THIS NUMBER.

A COMPLETE index of the contents of this issue will be found on page 116. This paragraph is intended simply to call attention to a few of the special features. Mr. Leo E. Miller, who accompanied Colonel Roosevelt on his South American explorations a year ago, describes and illustrates, on pages 62 to 65, the gathering of rubber as he saw it in Brazil and British Guiana.

Dirigibles and aeroplanes are playing a prominent part in the present war, and an authoritative article, fully illustrated, on the method of testing balloon fabrics will be found on pages 69 to 72. Six pages, from 89 to 94, are devoted to rubber goods that have recently come on the market and to new machinery for use in rubber factories. The latest discoveries of the rubber chemists receive two pages—67 and 68. The papers read at the late London Rubber Conference are briefly described by a member of that body on pages 98 and 99.

The effect of the war on the rubber trade in England and on the Continent is a matter of supreme interest to American rubber manufacturers. The English situation is described by two resident correspondents on pages 95 to 97; while conditions in Germany are given in considerable detail on pages 101 and 102.

CRUDE RUBBER CONTRABAND.

THE status of crude rubber as viewed by the belligerents has undergone several changes since the beginning of hostilities. At first only tires, dirigibles, aeroplanes and fabrics employed in their manufacture were put on the contraband list. Then, late in September, the British Government added crude rubber to the list of conditional contrabands. That is, it could be exported to certain ports in Europe—those of France, Belgium, Russia, Spain and Portugal—but to no others. Early in October the French Government placed crude rubber among the absolute contraband articles, and later in the month the British Government practically made all plantation rubber contraband by decreeing that no shipments from the Far East plantations under British control should be made anywhere except to London. This was followed a few days ago, according to cables received in New York, by the prohibition of all exports of crude rubber from an English port. In other words, the British Government decreed that all rubber from British controlled plantations should go to England and stay there, at least for the present.

It was given out that the requirements of the allied armies would be sufficient to absorb practically the whole plantation production for the next six months. It was stated that the British and French military authorities would need a new equipment of tires for the quarter million motor transport vehicles now being used in the war, and that there would be a great demand for water-proof ground sheets for the troops; for rubber boots, to be used in digging trenches; for all kinds of surgical appliances, and for various other articles incident to military operations.

But will England really require for her own use and for that of the Allies all the plantation rubber which normally should be shipped during the next six months? According to estimates made earlier in the year, the plantation output for the next half year should amount to thirty-five thousand tons. Now, during the first six months of the present year England imported a little over thirty-five thousand tons and exported a little over twenty-nine thousand tons, retaining for her own manufacturing purposes less than seven thousand tons. In other words, during the first half of the present year England's consumption of crude rubber amounted to a little over a thousand tons per month; and she now practically announces that during the next six months her rubber consumption will amount to six thousand tons per month,

or six times what it was before the beginning of the war. Obviously, this will hardly be the case, for while the demands made by the British and allied armies for rubber goods will be large, the general consumption by the people of England, France and Belgium will assuredly be materially decreased.

The probability is that the British Government does not expect to need the entire plantation product for the next six months, but purposes to be in a position to let none of this rubber go through any channels where it may ultimately help the enemy. It is quite likely that plantation rubber will be permitted to leave London for New York where it is accompanied by satisfactory guarantees that it will not later find its way, in the form of tires or other military equipment, to the armies of the two Kaisers.

If London should absolutely retain every ton of plantation rubber during the next six months, compelling the United States to depend entirely upon shipments from Para, the supply would certainly be scant, for during the six months beginning with November, 1913, the receipts of South American rubber in the United States amounted to less than twelve thousand tons. There is no reason to believe that the receipts for the next six months will be any greater than they were a year ago. But the situation even without plantation rubber would not be so desperate as it may appear, for there is reclaimed rubber—an ever present help in time of trouble.

SELLING TO BELLIGERENTS VIOLATES NO LAW.

THERE has been so much misunderstanding among American exporters and manufacturers regarding the sale of our merchandise to the belligerent nations, and so many appeals have been made to the State Department for information as to whether such sales were in violation of our neutrality, that the Department has felt it necessary to issue a statement covering the situation. This has been done by Assistant Secretary Lansing, and done so clearly and explicitly that there would seem to be no further excuse for any misconception. It is only necessary to cite two short paragraphs from his statement, which fairly well cover the whole ground. They are as follows:

"In the first place, it should be understood that, generally speaking, a citizen of the United States can sell to a belligerent Government or its agent any article of commerce which he pleases. He is not prohibited from doing this by any rule of international law, by any treaty provision or by any statute of the

United States. It makes no difference whether the articles sold are exclusively for war purposes, such as firearms, explosives, etc., or are foodstuffs, clothing, horses, etc., for the use of the army or navy of the belligerent.

"Neither the President nor any executive department of the Government possesses the legal authority to interfere in any way with trade between the people of this country and the territory of a belligerent."

Accordingly, any American rubber manufacturer can take all the orders he can get for anything he produces that may be wanted by any of the belligerent countries, whether tires, boots, shoes, coats, hospital accessories or any other kinds of rubber manufacture. The only question he need ask himself, to borrow a current Americanism, is this,—Can he put them across? It is obvious that if his exports are going to the Allies, he runs no very great hazard. If they are intended for Germany or Austria, under present conditions that's another matter.

THE COTTON CRISIS.

IT may be stated at the start that the cotton crisis, while by no means past, is not as acute as it was a short time ago. The assurance given a few days ago by the British Government that there will be no interference with cotton shipments from American ports to Germany or Austria had the instant effect of stimulating exports of this staple from this country. On the receipt of this assurance cotton exports, which had languished ever since the beginning of the war, immediately jumped from a few thousand bales a day up to forty thousand bales, with a probability that equally large shipments will continue. For the first time since the outbreak of the war, orders were received last week from Germany, and shipments began immediately to be made to that country. Simultaneously with this welcome change in the situation there appeared excellent promise of the success of the Bankers Pool, which expects to make one hundred and thirty-five million dollars available for the assistance of the planters. So, while the cotton burden has not been lifted, it assuredly has been materially lightened.

The war, which brought injury to business in this country generally, played particular havoc with the cotton industry. The present crop amounts to fifteen million bales. Normally, ten million bales would have been shipped abroad, but during the first ten weeks after the beginning of hostilities it looked as if barely a million bales would find foreign purchasers, leaving the planters

with a vast aggregate of nine million bales, or nearly two-thirds of the entire crop, unsalable in their warehouses. It is hardly to be wondered at, under these conditions, that the southern contingent at Washington should seek government relief. It will stand out as one of the most notable achievements of the present Congress that with so much sympathy for the southern situation it withstood the great temptation of shifting the planters' burden to the shoulders of the Government which certainly would have been a very bad precedent in paternalism. Further attempts by the southern members of the Senate and the House may be made for government assistance, but every bale that goes abroad from our ports during the next few weeks will make this attack on the Federal Treasury less likely to succeed.

Last year Germany bought 2,785,000 bales of our cotton, with a value of \$182,000,000. It is not to be expected, of course, that there will be any such demand on the part of that country this year, but if Germany were to take one-half of last year's purchases, and the other European countries follow in like proportion, the planters' problem, if not solved, would certainly be much nearer solution.

But the great lesson which the South must learn from its present condition is the necessity of curtailing its cotton proclivities, at least for the next year or two, until demand has overtaken supply. Too much of a good thing is a bad thing. No section can enjoy robust health when its functions are deranged by a great mass of undigested material, be it cotton or what not.

RUBBER PROPAGANDA.

WHEN crude rubber is scarce and high, manufacturers seek substitutes and new compounds. When it is plentiful and low, producers talk restriction of product and new uses. They also become rubber educators. The planters in the Middle East, for example, are considering extensive missionary work among rubber manufacturers to show how much superior plantation rubber is to any other. The producers up the Amazon also plan to institute a "propaganda" among manufacturers to impress upon them the fact that Brazilian Para is best and should therefore always have the preference. Indeed the South American boomers go further. They seriously consider addressing the great consuming public and urging them to demand that what they buy be made of "the best rubber in the world."

No doubt these missionaries will be welcomed, listened to respectfully and given every opportunity to demonstrate their claims, but it is doubtful if these efforts will increase the use of one or the other sorts in the slightest

degree. The only way that the planters can eliminate wild rubber is to produce something better as well as cheaper. The Brazilians can drive out plantation rubber only by producing wild rubber cheaper as well as better. Samples, circulars, propaganda, missionary visits, will not accomplish half as much as even coagulation, clean smoking, and standard brands.

At the annual meeting of the Merchants' Association of New York, held October 15, the manager of the foreign trade department of the National City Bank of that city, described the steps that had been taken by his institution toward the establishment of branch banks in South America. He stated that the staff for the bank to be established in Buenos Aires had already been selected and was on its way to that city; that suitable quarters had been secured, and that the bank would be in active operation during the present month. This is the first American bank ever established in any foreign country.

Few people outside of banking and exporting circles have any appreciation of the significance of this new enterprise and its particular significance as pertaining to South America. The great obstacle in the way of increased commerce between North and South America has been the necessity of financing all such operations through European banks. This necessity will now be entirely removed.

FOR FIFTY YEARS THE CHAMBER OF COMMERCE OF NEW YORK has enjoyed an unbroken series of successful annual banquets. This year, because of the great war and the widespread distress and suffering, there is to be none. Members of other prominent associations have taken the same action. This, of course, entails self denial on the part of feasters, orators and listeners, but as a practical expression of sympathy it is excellent. For America to feast and rejoice while Europe starves and mourns might smack of callousness. The Rubber Club of America has been canvassed by its secretary for an expression of opinion regarding its banquet slated for January 5 next.

The members were asked to state their preference, whether to hold the dinner or to omit it and donate the amount that the dinner would have cost to the American Red Cross. Responses have not yet been received from the entire membership, but nearly two-thirds have replied, and of that number the sentiment is so overwhelming in favor of omitting the dinner and contributing the amount to the Red Cross and other humane agencies which are seeking to mitigate the horrors of the war in Europe, that it has been definitely determined to abandon the dinner.

Among the Rubber Collectors of the Remote South American Hinterland.

By L. L. Miller, American Museum of Natural History

[Mr. Miller has not only devoted a great deal of time to exploration in South America in the interest of the American Museum of Natural History, of New York, but he was one of Colonel Roosevelt's famous party that discovered the "River of Doubt." His description of rubber gathering on the Upper Orinoco in Venezuela and along the Machado in Brazil—both visited by him last year—makes a valuable and interesting addition to the contributions on this subject which have already appeared in these columns.]

NEARLY four years of constant exploration and travel in the wilds of South America have taken me into many out-of-the-way places and little-known parts of that continent. Invariably my mission has been a scientific one—to study the fauna and the flora of the region traversed, and a good deal of my time has been spent in the haunts of rubber gatherers—those pioneers of the tropics whose frail crafts are constantly pushing beyond the utmost frontiers of civilization in quest of new fields to conquer, and braving a hundred dangers in their opening up of the dark and silent waterways in the interior of the great, mysterious land. In recent years much has been written concerning the conditions attendant upon the exploiting of rubber lands in parts of South America, some of which is true, a great deal of which is untrue. It is one of the objects of this paper to bring to light some of the interesting phases of the life that is lived in the eternal solitudes of the boundless forests with which I became so intimately acquainted but of which comparatively little is known in general.

It has rarely been my privilege to penetrate into more primitive regions than the headwaters of the Orinoco, or into a land of greater promise than is found along the upper reaches of the Gy Paraná, better known as the Rio Machado. The Gy Paraná, it might be well to state, is one of the largest affluents of the Madeira. For many years its lower course has been known to adventurous seekers of orchids, rubber and other natural products, all of which have been yielded in abundance; but it is only within the last few years that the course of the upper river has been thrown open to navigation of any kind. Even now only an occasional dugout ventures beyond the zone of pestilence and rapids into the land of hostile Indian tribes; but the way has nevertheless been opened, and within a comparatively short time this region will be giving up its fair quota of the natural riches that lie hidden in the vast, untrodden wilderness.

The Orinoco is, no doubt, better known by name than the

Machado, and at present it must suffice to give merely a vague idea of the remoteness of its hinterlands by citing that it requires approximately three months of travel from Ciudad Bolívar, two hundred and forty miles from the mouth of the mighty river, to reach the Rapids of Guajaribo, far above the mouth of the Cassiquaire; beyond that point the river is wholly unknown.

On February 28, 1913, I stopped at the barraca of one

Senor Paraquete, far up on the Orinoco, beyond the mouth of the Ventuari. The main building stood on a high bank thirty feet above the river, and was occupied by Sr. Paraquete and his assistants. Several large rooms were used as a *canta* or store and a fair stock of provisions and merchandise was carried. On one side was the camp of the full-blooded Indian employes, Maquiritaires from the regions of the Cunacunuma, who lived in small palm-leaf huts with their families. On the

SMOKING HEVEA BRASILIENSIS, RIO MACHADO.

other side stood long, thatched buildings, open all around, with scores of hammocks strung from the posts and beams; these were the quarters of the natives—Venezuelans and Zambos. In the rear, and some distance away, stood the smoke-houses, completely enclosed with palm leaves except for one small door opening. Trails led into the forest from a number of points, and numerous dugouts tied to the landing indicated that work was also prosecuted on the other side of the river. Often, especially in the case of the Indians, man and wife worked together. Old-fashioned methods are employed entirely. The trees are girdled with strips of palm pith at the base which intercept the latex and deflect it into a folded leaf placed underneath. This system is rather wasteful and injurious to the trees. There is no fixed rule or custom for tapping the trees, the men hacking into the bark at random, but occasionally the herring-bone pattern of cut is used. Each man has two routes, and endeavors to have from three to five hundred trees on each, seldom more, often less, according to the abundance of the rubber trees in the locality. He takes one trail one day, and the other the next, thus

permitting the trees to rest on alternate days. If it rains the day's catch is spoilt, as latex mixed with water is worthless. The season of 1913 had been a poor one; at the beginning the flow was abundant and of good quality, one hundred pounds of latex yielding sixty pounds of rubber. That was in December; by May five hundred trees were producing only twenty-five pounds of milk, and this was of such poor quality that it contained but 40 per cent. of rubber. Of course, the trees had become weakened as the season advanced, which also accounts for the decrease in yield, but the main trouble had been almost constant rains long before the regular wet season. The milk was weighed as brought in by each man at midday and credited to his account; in the afternoon the whole force repaired to the smoke-house to work up the day's catch. A kind of wood called Mazarandul is used exclusively for the smudge; it is of a deep reddish color and grows plentifully along the river.

The cost of transportation between the Upper Orinoco and Ciudad Bolivar is enormous. In the first place, the distance is very great and the river is full of rapids, necessitating long overland portages; all provisions have to be brought up, and the crude product has to be taken back down; there is always a great loss both ways from theft and wreckage, and as there is no regular system of navigation beyond the mouth of the Apure, the difficulties encountered in securing boats and crews are tremendous.

The headquarters of the Orinoco rubber gatherers is San Fernando de Atabapo, containing about a hundred huts, which is the only settlement above the Cataract of Maipures. In February the town was almost deserted. In May it was full of life. Numbers of people were arriving daily; there was dancing and gaming, eating and drinking, day and night, and many a man spent his entire season's earnings in a few evenings. The sight was not unlike that formerly seen in the western mining camps of our own country. Representatives of the big houses in Ciudad Bolivar, which had made advances to the concessioners, were there to see that they received all the rubber collected by their debtors. The governor of the department (Alto Orinoco) made his home further down the river, on the Rio Cataniapo, near the Rapids of Atures. He explained that it was "healthier" on the Cataniapo than at San Fernando, and I subsequently learned just what he meant; but more of this later. All goods going up the river were stopped at his domicile, examined and an *impuesto* collected. There was also a good deal of pilfering of boxes and bales by the light-handed inspectors. Another tax was imposed on all rubber leaving the territory. No wonder that there was great dissatisfaction with the existing regime, and a few days after I left San Fernando the injured parties took a terrible revenge. The governor (Gen. Roberto Pulido) had come up from the Cataniapo and had decreed that not one

ounce of rubber was to leave the district until the tax had been paid in advance. This tax was looked upon as robbery, pure and simple, and it was said, was illegally imposed by the governor for the benefit of his own pocket.

So one night, as Governor Pulido lay ill with fever, his room was entered and he was killed and horribly mutilated. At the same time all the other government officials in the town were treated in like manner and in the riot that ensued the greater part of the male population of San Fernando was exterminated. It was said that Indians had made the attack, but probably the real perpetrators of the deed were a group of the

HUGE BALLS OF CRUDE RUBBER SPREAD OUT TO DRY ON THE UPPER MACHADO.

owners of concessions in that district who objected to what they called open robbery. Personally, I was treated most courteously by Governor Pulido, and he helped in many ways to further my mission. However, there seems little doubt that he drove his methods of extortion too far; this was apparent even in the postoffice, where postage stamps were sold at twice their face value, and if anyone refused to buy them but used stamps purchased elsewhere, there were reasons for believing that the letters never left the building.

The difficulties of travel on the Machado are even greater than on the Orinoco. In eight days we came down a stretch of water that requires three or four months to ascend. The current is terrific; in a large *batelão* we could easily travel eighty kilometers a day. Rapids are numerous, those of San Vicente being the most dangerous. Just before my visit a *batelão* with a crew of thirty-one had gone over, of whom twenty-seven were never seen again. Steam launches, privately owned, now ply between some of the worst rapids and greatly facilitate travel. By their use we covered in one day a distance that had formerly required five months, as the boats had to be dragged around long and difficult portages.

On the Machado the rubber camps are not abandoned during the rainy season but as the floods advance stand isolated above the muddy water, crowded with their human inhabitants, chickens, pigs and dogs. Many of the houses are built on piles, and the water comes up until it touches the floor. As may be expected, the interior is always damp and ill-smelling. Cooking and washing are done on the front porch and canoes are tied to the posts in readiness for instant flight if necessary, or to use in gathering wood or visiting the neighbors. Behind the huts, banana palms bend and bow gracefully as the current tugs at their bases, and a few vultures are usually perched on the roof. The whole presents a scene of devastation, but the people seem perfectly happy. If there is any high country within reach, the men may cut timber and collect copaiba oil or hunt for various kinds of gums. The gathering of Brazil nuts forms one of the chief occupations, and thousands of tons are brought down the various rivers annually. Canoes are hollowed out, palm leaves and poles for new huts are brought in, and every-

thing is made ship shape so that there may be no delay in beginning the rubber season when the water recedes. There are invariably a few men in each camp who are famed for their prowess with gun and harpoon, and it has been my pleasure on several occasions to accompany these nimrods of the tropical jungles on their long rambles in search of meat.

At Calama on the Madeira, just opposite the mouth of the Machado, are located the headquarters of one of the best organized rubber companies I have found anywhere during my four years of explorations. It is the establishment of Asensi & Co., who started business eighteen years ago with eight men; today they employ 3,500 men all told, and produce 700 tons of rubber annually besides large quantities of copaiba oil, tobacco, lumber and other natural products. Their concessions cover the entire country bordering the Machado and Commemoracion, extending inland a distance of thirty kilometers on each side of the water. In addition, the concern controls large tracts on the Madeira. The buildings at Calama are large and comfortable, and besides living quarters include modernly equipped offices, store-rooms, warehouses, carpenter and machine shops and cattle barns. A resident physician is retained for the care of the employes, who are brought down from the camps and cared for when in need of treatment. Each department is in charge of competent officials, and the spirit of co-operation and efficiency is plainly visible even to the casual observer. All steamers plying on the Madeira call at this port, while numbers of the fleet of privately owned launches and other craft are arriving and departing at all hours of the day and night. Provisions in enormous quantities are sent up-river. To reach the farthest outpost, each parcel has to be carried on four different launches, twice on mule back, eight times on men's backs and

five times in canoes and batelaos, a form of transportation at once difficult and time-absorbing.

In the working camps conditions are better than in many other regions. A rigid set of rules has been formed regulating the tapping of rubber trees, with which all tappers are compelled to comply in bleeding the precious *Hevea Brasiliensis*. At first a long handled, narrow-bladed ax is used, which enables the men to make an incision at twice their height from the ground. No tree is touched unless it has a circumference of at least four spans (all measurements are made with the hands, for convenience) and all cuts must be two spans apart, so that if a tree has a circumference of twelve spans, a circle of six spans is made each day. At first these cuts are of too great height above the ground to permit of cups being placed to catch the latex, but they are necessary to stimulate the flow on the sap, which nature intends to cleanse and close the wound so that it may readily heal. To facilitate the healing process the cut is not made at right angles with the tree, but slantingly. Each day a new ring of cuts is made one span below that of the previous day, so that within a week after starting a tree the cuts are within reach and the flow of milk is sufficient to be collected. A small tin cup is pushed into the bark under each incision, into which the sap flows. A short-handled ax is now used and the rows of cuts, one beneath the other, are continued until the ground is reached, when new ones are started just halfway between the old ones, and this is continued indefinitely so that the original openings are not reached again until many years later when they have of course completely healed. The collector starts out in the early morning making the cuts and placing the cups, then he retraces his steps and collects the catch. Should the day be very windy he will probably find that instead of a

LEAVING RUBBER RAfts DOWN THE RIO MACHADO

liquid each cup will contain a neat little white cake of cheese-like consistency; the natives attribute this coagulation of the latex to the action of the wind, but the real cause may be traced to the multitude of small particles of bark and twigs that have fallen into the cup; if the cake be cut open, a great many impurities will be found imbedded in the interior like raisins in a muffin.

Great care must be exercised in smoking the latex of *Hevea*. If allowed to stand too long, the finished product will contain numerous small holes, like a cheese, and will be graded as of inferior quality. If prepared while perfectly fresh, it is smooth and firm and of the best quality. In preparing rubber in the old way—that is by pouring the latex over a paddle and revolving it in a column of smoke until a ball weighing several hundred pounds had been formed—there was always a considerable amount of loss to the producers, and for the following reason. It required the run of many days to produce a ball of this size with the result that on some days the latex was prepared properly and a perfect layer was added to the rapidly growing ball, while on other days the layer added was of a porous consistency. When the ball was finished and cut open for inspection the two qualities showed plainly and the whole ball, including the first-class layers, was classed as *entre-fina* or second quality.

The Asensi company has evolved a method of working up the latex that eliminates all this loss. Instead of the paddle, a wood cylinder nine or ten inches in diameter and a foot wide is used; there are low flanges on the ends, and the whole resembles a shallow spool. After having been smoked the cylindrical piece of rubber is slipped off the form and cut open, resulting in a flat slab. This process possesses many advantages. Each slab represents one day's work for one man; the quality of the rubber is immediately visible, and the surface presented to the smoke is so large that it takes less time to prepare the latex. The flat slabs pack easily and save all the space that is lost in packing the large, unwieldy balls; there is no possibility of mixing the two qualities, and the slabs dry perfectly and cut down the dead weight of water. In smoking the latex of *Hevea Brasiliensis* the nuts of *Attalea Excelsa* are used exclusively for the smudge.

Although there is no scarcity of *Hevea*, *Castilloa* is not overlooked. The trees are cut down and a deep spiral is cut in the trunk; basins are set underneath to catch the sap. That which adheres to the trunk is pulled off in long strips and wound into balls; the milk caught in the basins is coagulated by dropping into it the juice of a vine called "bataatama" and a small quantity of common soap.*

On the Machado I saw an ingenious way of transporting rub-

ber down river from the camps in the interior. Formerly boats had been used entirely for this purpose, which method incurred heavy expense on account of the great weight of rubber. Large crews had, of course, to be maintained for the purpose of looking after the boats, to say nothing of the cost of the boats themselves; now, all this is changed. The rubber is rafted down the stream. A strong rope is passed through the hole in the center of each *bolon* and the ends are then tied together so that they resemble a string of massive beads. A number of these strings are placed one within the other as shown in the photograph. Then a single ball is inserted in the center, with a flag stuck in it, and the "raft" is cut loose. On it floats with the current, slowly where the water is quiet, and dashing madly through gorges and over rapids. Two men follow leisurely in a small dugout, always keeping the bobbing flag in sight. At night they paddle up to the raft and tie a lantern to the flag-pole, then they follow the light. When the floating mass reaches the end of the journey ropes are fastened to it and it is moored at the landing, shed out and prepared for the steamer.

Taken altogether, the life of the rubber collector is one of hardship and deprivations, but it is not without its bright side, and as a general rule is not nearly so bad as often represented. The care-free life and the charm of the boundless wilderness act as a powerful magnet that attracts, year after year, men who know exactly what to expect. We

must also not forget that usually we are judging according to our own standards of comfort and luxury, conditions which do not exist in the regions in question and of which nothing is even known. Life at its best among these primitive folk appears decidedly uninviting to us, but not to them. They are living the life of their fathers, the life that was intended for them and for which they are adapted, and separated from which there would be only discontent and unhappiness.

DR. MANUEL LOBATO RESIGNS EDITORSHIP OF "FOLHA DO NORTE."

The "Folha do Norte" of September 8 contained an announcement of the resignation by Dr. Manuel Lobato, of the editorship of that journal, and an appreciatory notice of his services. Dr. Lobato has also resigned the post he had occupied in the municipality of Para. His name will be recalled in connection with the New York Rubber Exposition of 1912.

PLANS APPROVED FOR NEW BOLSA BUILDING AT BUENOS AIRES

Plans for the new Bolsa Building, to be erected in Buenos Aires, at the corner of Saenz and Corrientes streets, have been approved by the municipality of the city. These plans call for a building of greater height than the old Bolsa, and the city permit, but in view of the rubber boom, the municipality's exception is being made.

INTERIOR OF RUBBER CAMP, PARQUETTE, VENEZUELA

*A complete collection of the various tools and utensils used in its collection and manufacture were presented to the American Museum by Asensi & Co; it is now on exhibition in the museum in the Bronx Botanical Gardens.

THE INTERCONTINENTAL COMPANY'S ANNUAL REPORT.

THE annual report of the Intercontinental Rubber Co., issued on October 5 and covering the year ending July 31 last, states that the company's works at Torreon, Mexico, have been completely shut down during the entire twelve months. The company had some stock on hand at the beginning of the year, which it succeeded in shipping to New York early in 1914, but only a small quantity of this guayule was sold, owing to the low prices. Some sales at better prices were made immediately after the outbreak of the war, but these sales do not appear, of course, in the present report.

The Cedros ranch, owned by a subsidiary of the company, had to be abandoned and left to the mercy of the rebels during the whole year, so that nothing was received from this source.

Two dividends were paid on preferred stock during the year, the last being December 1, 1913, at which date all the outstanding preferred stock was retired for cash, leaving only common stock outstanding at the present time. The company's balance sheet is given below:

BALANCE SHEET—JULY 31, 1914.

ASSETS.

Investments in stock of merged and subsidiary companies:	
By cash	\$2,115,321.59
By stock issues.....	28,198,575.30
	<u>\$30,313,896.89</u>
Patents (exclusive of subsidiary companies)	15,141.77
Accounts and notes receivable, etc.:	
Advances to subsidiary companies	\$661,252.09
Sundry accounts	16,273.51
	<u>677,525.60</u>
Investment securities (market value)	1,065,000.00
Cash	388,573.44
	<u>\$32,460,137.70</u>

LIABILITIES.

Capital stock, common.....	\$29,031,000.00
Accounts payable, taxes accrued, etc.:	
Due to subsidiary companies	\$104,401.65
Sundry accounts	4,791.52
	<u>109,193.17</u>
Reserve accounts	1,124,103.58
Surplus (as below).....	2,195,840.95
	<u>\$32,460,137.70</u>

SURPLUS ACCOUNT.

Surplus, August 1, 1913.....	\$2,197,810.11
Net income from securities, interest, etc. (after adjustment of investment securities to current market value)	\$82,679.19
Sundry income	3,991.72
	<u>\$86,670.91</u>
Less administration and general expenses	35,681.74
	<u>50,989.17</u>
	<u>\$2,248,799.28</u>
Charges against surplus:	
Dividends paid on preferred stock up to Dec. 1, 1913.	\$36,458.33
Reserve against loans to subsidiary companies ...	16,500.00
	<u>52,958.33</u>
Surplus, July 31, 1914.....	<u>\$2,195,840.95</u>

AUTOMOBILE EXPORTS FOR FISCAL YEAR 1914.

ACCORDING to a summary issued by the Department of Commerce, Washington, the aggregate United States exports of automobiles and accessories for the fiscal year ending June 30, 1914, amounted to about 40 million dollars. This amount was apparently composed as follows:

	Number.	Value.
Commercial motor vehicles.....	784	\$1,181,611
Passenger automobiles	29,352	26,616,031
Parts (exclusive of tires) and engines.....		6,787,575
		<u>\$34,585,217</u>
Tires and engines (estimated).....		5,000,000
		<u>\$39,585,217</u>

The analysis of the distribution given below shows that Europe and North America took, respectively, 12¼ and 10¾ million dollars' worth of automobiles and parts, about two-thirds of the grand total of 35 million shown under those heads. Oceania took about 5 million dollars' worth, thus leaving only about 7 million for the remainder of the world, or about 20 per cent. of the aggregate shown by Table A given below.

TABLE A—AUTOMOBILE EXPORTS FOR FISCAL YEAR 1914.

	Commercial motor vehicles.		Passenger automobiles.		Parts. Value.	Total Value.
	No.	Value.	No.	Value.		
Europe	249	\$248,716	13,108	\$10,168,218	\$1,830,560	\$12,247,494
North America...	298	558,413	5,190	6,280,042	3,847,616	10,686,071
South America...	79	130,811	1,906	1,808,401	296,306	2,235,518
Asia	30	55,658	1,408	1,206,031	144,017	1,405,706
Oceania	113	171,407	4,833	4,338,977	334,956	4,845,340
Africa	15	16,606	1,861	1,591,294	170,777	1,778,677
Hawai			701	841,458	85,813	927,271
Porto Rico			291	320,680	70,025	390,705
Alaska			54	60,930	7,505	68,435
	784	\$1,181,611	29,352	\$26,616,031	\$6,787,575	\$34,585,217

AUTOMOBILES AND PARTS EXPORTED TO BELLIGERENT NATIONS.

Aggregate exports to Europe were \$12,247,494, of which the value of nearly eleven million dollars was shipped to the nations which have since become belligerents, in the following proportions:

TABLE B—AUTOMOBILE EXPORTS FOR FISCAL YEAR 1914 TO NATIONS NOW BELLIGERENT.

	Commercial motor vehicles.		Passenger automobiles.		Parts. Value.	Total Value.
	No.	Value.	No.	Value.		
England	203	\$189,099	7,017	\$5,662,435	\$1,305,657	\$7,157,191
Germany	24	18,462	1,411	1,040,787	213,351	1,272,606
France	2	5,070	1,427	919,060	179,351	1,103,481
Russia	2	5,322	926	898,458	14,079	917,859
Austria-Hungary ..	3	7,455	314	190,199	5,198	202,852
Belgium			244	139,681	20,978	160,659
Belligerent nations.	234	\$225,408	11,339	\$8,850,620	\$1,738,614	\$10,814,648
Other European nations ..	15	23,308	1,769	1,317,598	91,946	1,432,846
Grand total Europe.	249	\$248,716	13,108	\$10,168,218	\$1,830,560	\$12,247,494

Thus about seven-eighths of the United States exports of automobiles and parts for the fiscal year 1914 were to nations now at war.

Most interest attaches at present to the South American market, as being practically the only large outlet free from any connection with present or prospective hostilities.

TABLE C—AUTOMOBILE EXPORTS TO SOUTH AMERICA (FISCAL YEAR 1914).

	Commercial motor vehicles.		Passenger automobiles.		Parts. Value.	Total Value.
	No.	Value.	No.	Value.		
Argentina	48	\$65,225	940	\$963,586	\$92,633	\$1,121,444

	79	\$130,811	1,906	\$1,808,401	\$296,306	\$2,235,518

What the Rubber Chemists Are Doing.

SYNTHETIC RUBBER.

IN the September number of this journal an article appeared entitled "War Prices Will Start Synthesists Again." While there are no direct results in this line from the war, yet quite a little has been done lately, and the remarks of Sir William Crooks a short while ago in his presidential address, delivered before the Society of Chemical Industry, show that this eminent authority recognizes the value of the scientific work done in this line. Dr. Crooks said in part: "Recent work on the synthesis of rubber has attracted much attention and notable advances have been made. As long ago as 1882 Tilden noticed that isoprene was converted into rubber by certain chemical reagents; ten years later he showed that this product was capable of vulcanization. Subsequent work led to the recognition of the fact that most substances containing a conjugated double linkage tend to polymerize, the polymers ranging from sticky substances through well-defined rubbers to hard resins. Polymerization may be spontaneous or it may be brought about by reagents, acids or alkalies, by heat or by sunlight."

In 1908, C. Harries and F. E. Matthews simultaneously discovered that metallic sodium is an excellent reagent for the polymerization of isoprene. The action is practically quantitative and not affected by impurities. Moreover, it takes place in the cold or by only moderate heating.

Professor Harries showed that a superior product could be obtained by the polymerization of butadiene. Research showed that isomyl-alcohol obtained from fusel oil was a most suitable material to work on. By means of dry hydrochloric acid gas it was converted into chloride, then chlorinated to give the double chloride, from which the hydrochloric acid was eliminated by passing over hot soda lime. The isoprene so formed was then sealed up with 3 per cent. thin sodium wire and heated for several days to 60 degrees. The dark brown product thus formed was treated with acetone to precipitate the rubber. To obtain the fusel oil Fernbach has worked out a new process of fermentation starting with starch.

Holt has recently made some valuable discoveries relating to the manufacture of isoprene from the pentanes found in petroleum oil, and the preparation of butadiene from benzine or phenol, tetra hydro-benzine being formed as an intermediate product. He has also observed that when isoprene is treated with sodium in an atmosphere of carbonic acid gas it gives quite different products from those obtained by the same action in air.

Recent work shows that all synthetic caoutchoucs differ chemically from the natural rubber. Physically they are only equal to medium grade natural rubbers.

The above indicates that the most eminent chemists think commercial synthetic rubber within the range of probability, though it has not yet arrived.

TWO PATENTS CONTROLLING THE USE OF ANILINE DYES IN RUBBER

On October 13, 1914, the United States Patent Office issued two patents covering the use of aniline dyes in any rubber compound which is to be afterwards hot cured. The first of these, No. 1,113,614, is issued to Kurt Gotleib, and the second, No. 1,113,759, is issued to Rudolph Ditmar, both of whom assigned their patents to the Bayer Co., of Elberfeld.

It is rather curious that these two patents should be identical in wording throughout except in mentioning different dyes, and that both should be issued while one controls the other. One covers organic dyes and the other organic vat dyes.

In THE INDIA RUBBER WORLD of February last mention was made of some work contributed by Ditmar on the use of dyes of this class which these patents now cover. Should these claims be upheld they would cover the entire field of the use of organic dyes which can be mixed in while compounding and will stand the vulcanizing temperature, and no colored rubber made in this way could be put on the market without the consent of the patentees. It would appear, however, that the use of these dyes in this way has been known before.

Referring to the 1909 Edition of Pearson's "Crude Rubber and Compounding Ingredients" we find on page 173 the following: "These aniline colors being soluble in benzine can be mixed right with the india rubber. If the product be cured in open steam heat with sulphur some curious effects are likely to be obtained." This certainly discloses a method of mixing organic dyes and sulphur with rubber and curing with open steam heat.

SOME OTHER RUBBER PATENTS

United States Patent No. 1,113,630 has been issued to Fritz Hoffman, who assigns to the Bayer Co., of Elberfeld. This claims the production of caoutchouc by polymerizing butadiene with urea.

David Spence and William I. Russell have just been granted United States Patent No. 1,112,938 which claims the use of metallic or caustic alkali metals for improving the qualities of low grade rubbers. The patent is assigned to the Goodrich company. This corresponds to the British patent No. 17,667 for the same thing.

The use of sodium or other alkaline metal for the polymerization of isoprene according to the Harries method is of course well known, but it has hitherto not been applied to the improvement of low grade natural rubbers. The use of an alkaline earth has been proposed many times for desinizing low grade rubbers and it will dissolve many resins.

The use of the metals or their derivatives is also claimed to improve reclaimed rubber. Of course it would not seem that the use of caustic soda on a rubber reclaimed by the alkali process could have any further effect than the alkali with which it was reclaimed, but the use of metallic soda might affect it favorably. With the increasing production of plantation rubber the low grades and their improvement will become of less importance.

GERMAN RUBBER CHEMIST ARRESTED IN RUSSIA

Like all other "hostile aliens" the lot of the chemist caught in foreign countries now at war is a hard one and subject to dangers from the hysterical condition of the people. An English journal states that a German chemist at Petrograd, named Keller, who was employed by the Russian-American India Rubber Co., has been arrested. It is reported that a few months ago wholesale cases of mysterious poisoning occurred in various works in Petrograd and elsewhere in a number of rubber plants. A search of Keller's lodgings is said to have disclosed compromising papers and chemical compounds producing effects similar to those experienced by the workmen who were poisoned.

The probabilities are that the subtle police have got hold of his compounding formulas for rubber and, as these seem mysterious, they are likely to be regarded as some strange poison intended to exterminate the entire Russian nation; and probably the unhappy chemist will prove another victim to the excited state of the public mind in these times of war.

THE USE OF SODIUM BI-SULPHIDE IN COAGULATION OF LATEX.

Dr. H. P. Stevens stated at the International Congress of Tropical Agriculture, that sodium bi-sulphide was used to make pale crepe plantation rubber, as this was preferred by many users. Only what might be called a trace of this compound was added to the latex before coagulation and this was quite a different thing than adding large quantities to crude rubber which had been proposed elsewhere. To prove whether this addition was deleterious or not a sample of plantation was prepared with the addition of a small quantity of the sodium bi-sulphide to the latex and another was prepared without the same addition.

Both these samples were sent to a cable manufacturing company for trial and the test showed that the sample containing the bi-sulphide was if anything better than that prepared without it. To confirm this another set of samples was compared and a like result was obtained. Therefore it was concluded that the addition of sodium bi-sulphide was beneficial rather than otherwise in the coagulation of latex.

ISOLATION OF THE INSOLUBLE CONSTITUENTS OF CAOUTCHOUC.

Bernstein in the "Kolloid Zeitung," Vol. 15, page 49, comments on the work of Spence and Kratz which we reported in the October issue of this publication.

He states that the method they used is not novel in so far as it depends on the reduction of the viscosity of a rubber solution to enable one to separate the insolubles from the rubber. Diminution of viscosity may be produced by other means than that used by Messrs. Spence and Kratz. For example this may be accomplished by the use of acids, and sulphuric acid has been used for the estimation of caoutchouc in crude rubbers. Compare Marquis and Heim, A. 1913, page 884.

ASBESTOS PACKINGS.

Experience has lately shown that inquiries for asbestos stuffing-box packings have been at such low prices as to preclude the delivery of reliable articles, even where the percentage of cotton was a minimum one. Investigation disclosed the fact that the asbestos filling was in many cases heavily loaded with weighting substances, in order to reduce the cost. Asbestos is not of itself an expensive product, but, according to German experts, there are fillers 70 per cent. cheaper than asbestos and even still cheaper.

The question, however, has arisen of the effect of this packing on the piston rod, in producing heating, with the result that the machine is put out of operation until repaired. Such bad packings may cause a permanent injury to the reputation of factories, thus opening the way to competing products.

With a view to eliminating this difficulty, it has been suggested in Germany that manufacturers and dealers should combine in producing a quality of packing with a guaranteed percentage of cotton yarn and a good quality of asbestos. Such a quality corresponds with that delivered to railways by large factories. Hence it has been suggested to call this article the "Railway" quality, by which a distinctive grade would be indicated, the delivery of an adulterated quality being made a punishable offense.

Asbestos packings are sometimes delivered "Double Spun," but this is only found necessary with railway packings over 17 m.m. (0.67-inch) in diameter. For packings of smaller diameter, "Single Spun" is found sufficient for both railways and other consumers.

THE CONSUMPTION OF ANTIMONY.

In 1913 the United States consumed 12,755 tons of metallic antimony with a value of \$1,828,967. Of this amount there was 1,000 tons of oxides and salts valued at \$117,000.

ENGLAND SHIPPING CHEMICALS.

The restrictions which the British government placed on the export of chemicals at the outbreak of the war have been removed to some extent, and firms in the Manchester district are now in a position to fill reasonable orders for such supplies. The list of obtainable chemicals includes the following of interest to rubber manufacturers: Acetone; antimony salts, 45 and 75 per cent.; barytes, sulphate of all qualities, free from lime and suitable for all purposes; carbonate of magnesia; lithopones; tetrachloride of carbon; zinc, sulphate of; zinc oxide; chloride of barium; glycerine; rosin, and wax.

OZOKERITE IN UTAH.

According to a report of the United States Geological Survey, which has been making an investigation of the possibilities of this country in the way of producing articles hitherto obtained from Europe, ozokerite, or natural mineral wax, occurs in considerable quantity in Utah. The market for this product being largely in the Eastern States, the cost of production and transportation to such points has made it impossible to compete with the imported product, which came from Galicia. It is possible now, however, that interest may be taken in the development of the industry in this country.

RUBBER NOW ON THE CONTRABAND LIST.

A British decree proclaimed on September 21 places several additional items, including rubber, on the list of objects and materials held as conditional contraband by that country. Under dates of September 8 and 25 additions were also made to the list of articles of which export has been prohibited. Aeroplanes, airships and balloons of all kinds and their component parts are prohibited export to any destination whatever; while india rubber sheet, vulcanized, and rubber, raw, are prohibited exportation to certain countries, namely, to all foreign ports in Europe and on the Mediterranean and Black Seas, with the exception of those of France, Belgium, Russia (except the Baltic ports), Spain and Portugal. Late in October crude rubber became unconditionally contraband, shipment from any English port being prohibited.

On October 3 the French Government declared crude rubber and automobile tires contraband, the order covering "leather, pneumatic and other automobile tires and the raw products from which they are manufactured." This order has evidently been somewhat modified, however, and permission granted for the export of certain rubber products as, for instance, all tires made by the Gaulois company at Clermont-Ferrand, France, except solid tires, which are being turned out for the government at the rate of 400 a day. Export of Gaulois tires to the New York branch of this company is said to have been resumed.

The Russian Government has also prohibited the export of rubber and rubber tires, but this government is prepared to authorize, without any formality, the exportation of such prohibited goods as may not be required in Russia, in British or Allied vessels, if the port of destination is a British or Allied port. If the destination be a neutral port, permission will be granted only if the Embassy or Legation of the neutral country in which the port in question is situated certifies in agreement with the Embassy or Legation of the Allied country under whose flag the vessel sails that such prohibited goods will be unloaded in a neutral country and will not be re-exported to the country of an enemy.

The list of articles which Germany and Austria propose to treat as conditional contraband was made public on September 18 and includes, in addition to crude rubber, waste and substitutes, balloons and flying machines and their distinctive component parts and accessories intended for use in connection therewith.

The Testing of Balloon Fabrics.

By R. A. D. Preston

TESTING balloon fabrics may be considered as comprising first the routine testing of the fabric and its component parts during manufacture, and secondly testing of a research nature to determine the behavior of the fabric under special conditions. The principal routine tests made at the Goodyear Tire & Rubber Co. are tensile tests and resin determination of rubber to be used in the proofing compound, tensile and stretch test and determination of sizing in the unproofed cloth and tensile and permeability tests of the finished fabric. The specifications of a balloon fabric usually consist of maximum weight and maximum permeability to gas per unit of area and minimum tensile strength per unit width in the direction of warp and weft of the principal ply of fabric (in case of "bias" fabric).

Considering these in the order named, a sample of the rubber

is washed with special care, dried, compounded to a standard formula and a specially shaped sample mold-cured and tested for tensile strength, stretch and set on the H. W. Cooley machine (Fig. 1) which registers a graph of these properties. The resin content is determined by extracting with acetone, using the well-known underwriters' apparatus.

Tensile and stretch tests of the unproofed cloth are made on the Olsen fabric testing machine (Fig. 2). The standard sample dimensions for warp and weft strength have been the subject for considerable study. Test pieces 2 inches wide and 7 inches long are cut carefully with their length parallel to the warp and weft respectively. Three tests are made in each direction and

strength, the difference between dryness and saturation often reaching 40 per cent. of the normal strength.

The bare cloth is also tested for traces of starch sizing by boiling out a small sample in distilled water and testing the solution with iodine. Any appreciable quantity of sizing prevents the proper impregnation of the fabric on the spreading machines.

The strength and stretch of finished fabric is determined in the same manner as in the case of the bare cloth. Considerable

FIG. 1. COOLEY RUBBER TESTING MACHINE.

FIG. 2. OLSEN FABRIC TESTING MACHINE.

attention has been given to tests of fabric seams and standard specifications have been adopted which make the joint stronger than the fabric itself.

The most interesting and practically the only test in the series for which special apparatus other than that customarily used in the rubber and textile industries is required, is that for permeability to gas. Although illuminating gas is nearly always used for spherical balloons, the permeability of balloon fabric is expressed in volume of hydrogen (the gas exclusively employed for the inflation of dirigible balloons) which under specified pressure (usually the equivalent of 2 inches water) will leak through a unit area of the fabric in 24 hours.

There are several methods of determining hydrogen diffusion. That of most historical interest is the Renard-Surcouf balance. The apparatus consists essentially of an ordinary balance to one arm of which is attached a bell jar dipping into a water tank. Across the top of the jar the test piece is held by two metal rings with a rubber gasket, the whole being well bolted together. The bell jar is fitted with connections so that pure hydrogen may be passed through it. This is done until the air is eliminated. The bell jar is then weighted to give the desired pressure, when the stop cocks are closed and connections detached, balanced with weights on the other arm of the balance and allowed to remain 24 hours. Due to diffusion of hydrogen through the test fabric, the equilibrium will be destroyed and the bell jar will drop slightly. This will be indicated by the balance pointer, and with proper corrections expresses the leakage per 24 hours.

Another apparatus somewhat used in France is that of Josse. From the sketch (Fig. 3) it will be seen the essentials are a

one-half the average value of the breaking load taken as the tensile strength per inch. That this width sample gives the most representative value of tensile strength is confirmed by tests on specimens of varying width and length made at the English National Physical Laboratory. In making tensile tests of fabrics it is desirable to keep the samples for several days in a room of constant relative humidity (usually 65 per cent.). The amount of moisture in the fabric considerably influences its tensile

metallic box (2) surrounded with a water jacket to maintain constant temperature of the gas, provided with a flanged top (1), and ring and gasket arranged to hold the test piece. The bottom of this box is fitted with a glass graduated tube (7) which extends to the bottom of a concentric glass cylinder (8). There are two connections in this graduated tube, one to pass hydrogen into the box and the other a "U" tube (4) to register the gas pressure. Connected by a tube with pinchcock to the bottom of the concentric cylinder is a bottle (6) holding a volume of water equal to that of the graduated tube. The procedure is as follows: The fabric is first tested for impermeability to air by closing the valve (5) maintaining a constant pressure in the "U" tube by raising the bottle to the necessary height and noting if the level of the water in the graduated tube remains constant. If the fabric holds air it is then tested for hydrogen diffusion. Hydrogen is passed through the box under the fabric until the air is completely swept out (test burning of test tube of gas from "U" tube). The valve (5) is then closed and the loss of gas in a given time measured by the rise of water in the graduated tube necessary to maintain the stated pressure in the "U" tube.

The principal disadvantage of these types of apparatus is that their accuracy is dependent largely on the tightness of the drums or bell jars and connections, of which, due to necessary laboratory refinements, there are many; and that account must be taken of the diffusion of air into the drum.

The method used in the laboratories of the Goodyear Tire & Rubber Co. is to maintain a constant pressure of hydrogen on one side of a test piece of fabric while air is passed by the other side, taking with it the hydrogen which has diffused through the fabric, which hydrogen is burned to water in a combustion furnace and weighed, giving with a simple calculation the leakage of the fabric over a definite time interval. With this apparatus the only joint under appreciable pressure which must be kept tight is that between the fabric and the bottom half of the drum.

The technique of the test is as follows: The two hemispheres of the bronze diffusion drum (6) (Fig. 4) are opened and the balloon fabric diaphragm (7) to be tested is inserted, the two halves of the drum being then bolted together so securely that the joint is gas tight. The drum is then placed in a thermostatic bath (not shown in diagram) and brought to the required temperature, usually 20 deg. C.

When the drum and its contents have attained the desired temperature, hydrogen is allowed to pass from the cylinder (1) through the gas washing bottle (2) filled with strong sulphuric acid for drying the hydrogen, thence through the preheating furnace (3) whose purpose is to burn all organic gaseous impurities in the hydrogen and to combine any contained oxygen with it to water; the purified gas then passes through the gas washing bottle (4) filled with caustic potash solution to remove traces of carbon dioxide, etc., and then through the bottle (5) filled with strong sulphuric acid to remove the last traces of water, thence into the under side of the diffusion drum (6).

The purified hydrogen gas is passed into the lower half of the drum (6) and out through the tube (15) until all the residual air contained in this lower half has been displaced by hydrogen and swept out. The tube (15) is then closed and the pure hydrogen allowed to diffuse upward through the diaphragm for a definite time.

The hydrogen diffusing through (7) into the upper half of the drum (6) is swept out by a current of air admitted through the tube (14). The hydrogen containing air passes through the gas washing bottles (9 and 10) whose purpose it is to remove any adventitious moisture, they being filled with strong sulphuric acid; thence the gases pass into a heated combustion tube (11) filled with platinized asbestos, where the hydrogen is burned to water, which in turn is absorbed and weighed in the Geissler bulbs (12 and 13).

No. 8 is a pressure regulating device whose function is to maintain a constant gas pressure in the lower half of the diffusion drums, the pressure usually equaling a 2-inch column of water.

Knowing the exposed area of the diaphragm, the time of diffusion, and the weight of the water obtained by the combustion of the diffused hydrogen, a simple calculation enables us to determine the diffusion per square yard in 24 hours, and results are always reported as cubic feet of hydrogen diffused per square yard in twenty-four hours at the given constant temperature and pressure.

The apparatus of Professor Heyn in use at the Imperial Testing Laboratory Gross Lichterfelde (near Berlin) is essentially similar to the Goodyear equipment, except that the test piece is much smaller (about 4 inches against 9 inches diameter) and no provision (unless this has been done recently) made

for maintaining uniform temperature of the gas and fabric. It has been shown with the Goodyear and other apparatus that temperature has a marked effect on the diffusion rate.

The apparatus thus far described measures the amount of hydrogen which has diffused through the fabric during a given period. An instrument on an entirely different principle has been developed recently in Germany with which it is possible to read directly the rate of diffusion. This is the

FIG. 3. JOSSE'S APPARATUS FOR TESTING THE PERMEABILITY OF FABRIC TO GAS.

gas interferometer made by the firm of Carl Zeiss, Jena.

The principle of the apparatus is briefly as follows: The upper part of a pencil of light rays made parallel by a collimator passes through the upper halves of two narrow vertical slits in the objective of a telescope. Half the lower part of this pencil passes through one of two gas chambers between the collimator and the telescope and the other half through the other. These two sets of rays from the gas chambers pass through the lower part of the above mentioned slits in the objective. If one of the gas chambers is filled with pure air and the other with a mixture of air and hydrogen, on looking through the eye piece of the telescope the lower interference spectrum will be displaced with respect to the upper (whose rays do not pass through the gas chambers). By turning, by a micrometer screw, a series of prisms placed in the path of one of the lower sets of rays, the principal dark lines in the two spectra can be brought together. The number of divisions through which the screw is turned is a measure of hydrogen content of the hydrogen and air mixture. In practice air from above a test piece of fabric (and therefore containing hydrogen diffused through the fabric) is drawn at a known constant rate through the gas chamber of the interferometer while the other chamber is filled with purified air. The test piece is held in a drum essentially similar to that in the Goodyear apparatus. The instrument is calibrated by

observing the readings using known mixtures of CO₂ and air and correcting for the difference in indices of refraction of CO₂ and hydrogen or using directly mixtures of hydrogen and air, the former method being easier to apply in the laboratory.

Tests to determine the variation of diffusion with temperature and pressure show the diffusion rate to vary directly with the temperature within practical limits and to increase with increase in pressure but not proportionally, increments in permeability decreasing with increase in pressure. For a given temperature and pressure the permeability increases until the

In the last quantity the water pressure and temperature vary somewhat with different testing plants. A good spherical balloon fabric obtainable in this country has a weight of 7¾ ounces per square yard, strength (one ply on bias) of 40 pounds per inch, and a diffusion of 0.4 cubic feet. Two characteristic dirigible balloon fabrics have weights of 9 and 14½ ounces per square yard respectively, strengths of 90 and 130 pounds per inch, and diffusion rate of from 0.2 to 0.25 cubic feet. The first is two ply and the other three-ply parallel doubled fabric.

In addition to the routine work many research tests have

FIG. 4. APPARATUS USED BY THE GOODYEAR COMPANY TO TEST THE PERMEABILITY OF FABRIC TO GAS

fabric becomes saturated with hydrogen, then remains practically constant.

The units used in expressing results of the tests described are

Test.	English.	Metric.
Tensile strength.....	Pounds per inch.	Kgm. per meter.
Weight	Ounces per sq. yd.	Gms. per sq. meter.
Hydrogen diffusion...	Cubic feet per sq. yd. per 24 hours at 2 inches water pressure and 15 deg. (or sometimes 20 deg.) C. at 29.92 inches barometer.	Liters per sq. meter per 24 hours at 50 mm. water pressure at 15 deg. C. and 760 mm. barometer.

been made, utilizing for the most part apparatus already described, to determine, for example, the properties of balloon fabrics under such special conditions as compound stress, varying weather exposure, extremes of temperature; the relation of rate of diffusion to temperature and pressure of the gas, the increment of weight due to rain, etc.

An interesting series of tests has been made on the elasticity and ultimate strength of balloon fabrics under compound stress at the National Physical Laboratory in England. The test specimen was a cylindrical surface of the fabric 5 inches diameter by 12½ inches long fitting over metal end pieces so formed that the surface and ends as a whole can be placed in a testing machine for the application of a longitudinal tension, while one of the ends connects with an air supply for internal pressure.

HYDROGEN DIFFUSION APPARATUS USED IN THE CHEMICAL LABORATORY OF THE GOODYEAR COMPANY

and the other carries a ball thrust washer, so that no torsional stress of the bag as a whole can occur. The conclusions of the series of tests may be briefly stated.

1. For any single or double parallel woven fabric under compound stress the stresses in the fabric parallel to the warp and weft are independent.

2. A method is developed of computing the ultimate strength of a double diagonal cotton fabric under compound stress from simple tensile tests.

3. For a fabric under compound stress each of the two strains is a function of both stresses.

The Germans have with characteristic thoroughness worked out in detail the action of fabrics under compound stress. Preliminary to the design of the Siemens Schuckert dirigible, a large number of such tests were made using apparatus essentially similar to that above described. These are well described in Hass & Dietz's *Stoffdehnung und Formänderung der Hülle von Prall Luftschiffen* (J. Springer, Berlin).

Besides tensile and diffusion tests (the latter with Prof. Heyn's apparatus), bursting tests of considerable interest have been made at the Imperial Testing Laboratory (near Berlin). The apparatus is so arranged that any desired air pressure can be impressed against the under side of a circular test piece and a graph of rise of the center of the fabric surface and pressure obtained. A series of tests to determine the effect on apparent bursting strength of varying sample diameter and the relation between strength determined from the bursting test and tensile tests showed about 10 per cent. decrease in strength in sample diameter increase from 11.3 to 50.5 cm. and tensile test strength about 66 per cent. that of the bursting test. It must be noted that the fabric used was two-ply diagonally doubled fabric. On parallel fabric the tensile test strength would probably be higher than the bursting strength.

Another series of tests made at the National Physical Laboratory furnished valuable data on the effect of weathering on the permeability and tensile strength of several varieties of balloon fabric. Samples for both these properties were tested after 24, 48, 72, 96, 120 and 144 days' exposure. The most important conclusions are: (1) Fabrics deteriorate more when exposed to moisture and light than to light alone; (2) the coloring yellow of the outer cotton layer is clearly beneficial; (3) just before the fabric finally disintegrates its permeability is temporarily greatly improved (this indicates that a marked improvement in the gas tightness of an old balloon should be viewed with suspicion); (4) in most cases the decrease in tensile strength after 100 days' exposure is 30 per cent. or over. Tests in the Goodyear Tire & Rubber Co. laboratory tend to confirm the first, second and fourth of these conclusions.

Tests from the same source (N. P. L.) of fabrics after subjection to temperatures of -15 deg. C. and -25 deg. C. showed practically no effect of the former and a considerable increase in leakage due to the latter temperature. Tests for increase of weight due to water adherence showed about 10 per cent. for fabrics rubber coated on the outside and 20 per cent. for fabrics having cloth on the outer surface.

A series of tests to determine the transmission of heat through various types of balloon fabric was made in the Goodyear laboratories. It was found that the color of the inside of the fabric had comparatively small influence on the radiation. The influence of "slicing" the outside was also small. The fabric with yellow exterior and dark brown interior coating seems on the whole most satisfactory. In this manner is made the standard Goodyear balloon fabric.

MONOGRAMMED TIRES.

Automobile tires are now being made with the owner's monogram or initials molded into the casings, one company advertising that its New York branch will accept orders for tires made in this way.

MANY NEW MEMBERS FOR THE RUBBER CLUB.

AT the meeting of the Executive Committee of the Rubber Club of America, held at the Union League Club, New York, October 13, the following members were elected:

FIRM MEMBERS.

American Hard Rubber Co., James F. Giles.
11 Mercer street, New York.
H. A. Astlett & Co., E. R. Hawkins.
117 Pearl street, New York.
A. W. Brunn, A. W. Brunn.
Produce Exchange Annex, (Changed from active membership.)
New York.
Endurance Tire & Rubber Co., Wilson G. H. Randolph.
1789 Broadway, New York.
Earle Brothers, R. W. Earle.
66 Broad street, New York.
W. R. Grace & Co., W. E. Byles.
1 and 2 Hanover Square, New York. (Changed from active membership.)
Kelly-Springfield Tire Co., Van H. Cartmell.
227 West 57 street, New York.
L. Littlejohn & Co., Wm. E. Bruyn.
129 Front street, New York.
Goodyear Tire & Rubber Co., P. W. Litchfield.
Akron, Ohio.
Johnstone, Whitworth & Co., J. T. Johnstone.
140 Pearl street, New York. (Changed from active membership.)
Obalski & Sweeney, Edward C. Sweeney, Jr.
24 Stone street, New York. (Changed from active membership.)
Reading Rubber Mfg. Co., William H. Marland.
Reading, Massachusetts. (Changed from active membership.)
Republic Rubber Co., Thomas L. Robinson.
Youngstown, Ohio. (Changed from active membership.)
William H. Stiles, William H. Stiles.
97 Water street, New York.

ACTIVE MEMBERS.

Lloyd E. Appleton, F. H. Appleton & Co., 5 East 42nd street, New York.
Edward H. Huxley, United States Rubber Co., 1790 Broadway, New York.

ASSOCIATE MEMBER.

John W. Coulston, J. W. Coulston & Co., 80 Maiden Lane, New York.

The resignation of one associate member was accepted. The summary of membership is now as follows:

RESOLUTION PASSED BY THE EXECUTIVE COMMITTEE OF THE RUBBER CLUB OF AMERICA AT ITS MEETING HELD AT THE UNION LEAGUE CLUB, OCTOBER 13, 1914.

Whereas, the Executive Committee of the Rubber Club of America recognizes the importance of the Census of Manufactures which the Federal Bureau of the Census is required to take every five years, and as this census will be taken next year covering figures for the year 1914, it is hereby

Voted that the Executive Committee of the Rubber Club of America would recommend to all rubber manufacturers in the United States that they give their hearty co-operation to the Director of the Census in order that the statistics from the rubber industry may be accurate and complete.

PROTEST AGAINST MAKING RUBBER CONTRABAND.

The Rubber Club of America and the Rubber Trade Association of New York, recently organized by the rubber importers, are both considering entering a protest with the State Department at Washington against England's action in placing crude rubber on the list of absolute contraband.

THE INDIA RUBBER WORLD has also been appealed to by a number of individuals and corporations connected with the rubber industry to lodge a similar protest with the State Department.

The Editor's Book Table.

RUTHERFORD'S PLANTER'S NOTE BOOK. SIXTH EDITION, 1914.
The Times of Ceylon Co., Ltd. Colombo and London. [8vo, Pp. 478.]

THIS work, first issued (in 1887) for the benefit of Ceylon tea planters, has been expanded to cover all branches of tropical agriculture. The fifth edition having been sold in a week, a sixth is now on the market. It is still distinctly a work for Ceylon planters, though tea is now only one of the many crops comprehensively treated. While the information relates particularly to matters peculiar to Ceylon, there is much of interest to planters in all tropic lands and the whole work is full of curious enlightenment for the general reader. It is intended as a *vade mecum* for the Ceylon planter, treating of all the operations of the plantation from jungle clearing to bookkeeping and from digging out cocoanut beetles to capturing wild elephants. An endless variety of mathematical tables is presented to save time and give accuracy to the planter's estimates.

Of course, the most radical difference between planting in Ceylon and those operations in which most of the readers of this publication are interested is that dealing with the labor problem. It is assumed that every laborer is a "coolie," the number of coolies required is so and so, and the amount of work which can be done is so much "per coolie." The legal regulations dealing with the relation of planters and laborers are given in full and constitute interesting reading. The contract, if verbal, is assumed to be for a month only. Longer agreements must be in writing and acknowledged before a magistrate. The laborer may be employed during the hours usual to his occupation and when sent on a journey may not be required to walk more than twenty-five miles a day or carry a load of more than forty pounds. Most people will agree that further exaction on the part of the employer would seem a trifle oppressive.

In case of the sale of the estate to another person the contract is binding on the new owner, but the laborer may quit, on giving due notice. Refusal to work, on the part of the laborer, or to pay wages promptly, on the part of the employer, are alike punishable by imprisonment, as is also the enticing of servants from one employer by another. During temporary illness laborers receive food and medical care at the expense of the employer, who, however, is not bound to pay wages during such illness. Laborers' wages are a first charge upon estates. These wages seem generally to be 144 rupees, or about \$46 a year.

In addition to tea and rubber, there are complete chapters or comprehensive articles on cocoanuts, cocoa, cardamons, tobacco, sugar, jute, manila, hemp, sisal, ramie, san, hemp, bowstring hemp and silk cotton. The rubber section runs through 59 pages and includes estimates of opening and maintaining plantations; tables of cost and probable production during a series of years; distances and numbers of trees in plantations and plants in nurseries. The information about rubber seeds as a by-product is full of interest. The kernels amount to about 50 per cent. of total weight and these kernels yield 42 per cent. of oil similar to linseed oil, the residue furnishing a meal valuable as cattle feed. The seeds are collected by children at a price of a little over one cent a thousand, American money, and pay a moderate profit when shipped to Europe.

Methods of tapping, of coagulation, of packing and many other matters are discussed by experts in the light of the most recent experience. The regulations to prevent rubber theft read curiously like the extra-legal edicts of the Ku Klux Klan soon after the war, to stop the brisk midnight mer-

chandizing of cotton, which had become a business custom in many localities of the South. The penalties, however, are not the same.

HENDRICKS' COMMERCIAL REGISTER OF THE UNITED STATES for Buyers and Sellers. New York, 1914. S. E. Hendricks Co. [Cloth, quarto, 1,596 pages. Price 10 dollars.]

ABSOLUTE accuracy in classification is the chief merit of any directory; but to accomplish this object requires an immense amount of research and verification. This is particularly the case in a work intended to be used for constant reference, in which every name has to be checked over to insure correctness.

All these points have been kept in view in the compilation of the twenty-third annual edition of the above work, which has just been issued, and is well up to the mark of its predecessors. In fact, it includes many new features; it gives the names and addresses of the manufacturers of machinery and appliances required in the treatment of crude materials, including rubber, in appropriate classifications and sub-classifications. The descriptions of the various products are sufficiently detailed to give the prospective buyer just the information he is looking for. The principal houses in the rubber industry are also listed.

Numbering about 350,000 names in upwards of 45,000 business classifications, it will be readily understood why the index alone takes up 138 pages. The work, in its current issue, has fully maintained its reputation for accuracy and completeness.

THE FIRST OF THE 1915 CALENDARS.

The R. J. Caldwell Co., of 15 Park Row, New York, has stolen a march on all its rivals and been the first to issue a calendar for the year 1915. This company, which deals in tire fabrics—Sea Island, Egyptian and Peeler—handles the products of the Connecticut Mills Co., Inc., of Danielson, Connecticut, and the Canadian Connecticut Cotton Mills Co., Ltd., of Sherbrooke, Quebec, which have a combined capacity of 8,000,000 pounds; therefore it is quite appropriate that the 33 x 16 inch panel to which the calendar section is attached should contain reproductions of photographs of these two mills, while Old Father Time is pictured as "Still Going Strong," employing tires constructed of the fabrics of these mills to lend speed to his progress.

A NEW MILLER BOOKLET.

An interesting catalogue of information on accessories and illustrated description of repair materials has been published by the Miller Rubber Company, of Akron, under the title, "Modern Accessories for Permanent Tire Repairs." This attractive booklet covers all articles used in connection with the care and repair of tires. Illustrations and descriptive matter are clear and concise, and the booklet should afford valuable assistance in the selection and application of the right materials for any phase of tire repairing.

THE AMERICAN RUBBER CO.'S HANDSOME BOOK.

The American Rubber Co., of Boston, whose big factory in Cambridgeport, just across the Charles river from Boston, is a very conspicuous feature of the local landscape, has just issued a particularly well printed and handsome book of interior views showing the administrative offices and the various departments of the factory devoted to the manufacture of rubber garments. There are over twenty of these interior views (not to mention a few exteriors). They show the crude rubber, the sheets in the drying room, the rubber going through the calendars, the spreading and cutting rooms, the big workshops where the stitching is done, and finally, the garments hanging on racks in the vulcanizing rooms. This factory, by the way, has a capacity of over 3,000 garments a day.

SOME INTERESTING LETTERS FROM OUR READERS.

TO the Editor of THE INDIA RUBBER WORLD—Dear Sir: I would appreciate an opportunity of replying to your criticism appearing in the last issue of THE INDIA RUBBER WORLD, under the title "Mr. Cowen and the Marks process." This criticism is directed at remarks I made recently in England, in referring to the Alkali Process for reclaiming waste rubber. No one actively engaged in the rubber industry, at the present time, appreciates any more than I do the value to the industry of your vast and extended experience and the many acquaintances you have enjoyed with its most prominent men. There is no doubt but that we may list Mr. Robert Cowen as one of the foremost of these and one who did a great deal for the development of the rubber industry. I quite agree with you that Mr. Cowen was not a chemist, but he was indeed an expert machinist and an inventor. However, might we not say the same of Edison or of Goodyear? The former's inventions cover a wide range of the sciences, including chemistry, yet he could hardly be considered a chemist. The same is true of Goodyear, whose early training in the hardware business may have been of some assistance to him from a mechanical point of view, but had he known that *aqua fortis* contained sulphur he would no doubt have been able to take quicker advantage of the phenomena he observed in his experiments and detect the real relation existing between his tests and those of the unscientific Heywood, who had been using powdered sulphur. It is not at all uncommon to find that inventors seldom derive direct benefit or have a knowledge of the state of the science existing at their time. Mr. Cowen made up for this lack, in part, by employing young college graduates to work out his many ideas. Arthur H. Marks was one of these.

The statements I made, however, were not based upon hearsay. You must be aware that several patent suits have been brought to uphold the validity of the Marks patent, and some of these, I believe, are still pending. Without any desire, at the present, to go into the merits of these various cases, I would call to your attention letters which have been introduced in evidence and I think you will agree they sustain my statements.

In a letter from Mr. Cowen as Technical Manager of the Boston Woven Hose & Rubber Co. to Mr. Raymond B. Price, under date of October 25, 1900, he says:

"Since *he* went away from us I understand that he has taken out a patent for devulcanizing rubber by the use of high pressure and caustic soda. You well know that during the time that he was with us he was carrying out experiments of this nature. Of course it is well known to everyone who was connected with our company at that time that *he* was merely a workman in the laboratory carrying on this work under *your* direction—which work was directed mainly from suggestions received from *myself* as your superior officer at that time."

The word "*he*" refers to Mr. Arthur Marks, and the italics are mine.

Later Mr. Raymond B. Price, in writing to Mr. Robert Cowen as Technical Manager of the Boston Woven Hose & Rubber Co., under date of September 16, 1901, says:

"Your own letter files will show that the idea of carrying on the process on a larger scale was followed right up to the time of the company's failure." (1898) (Marks patent granted 1899)

The process referred to is the Alkali Process, and the "company" is the Boston Woven Hose & Rubber Co.

The following is an extract from a letter by Mr. Robert Cowen as Technical Manager of the Boston Woven Hose & Rubber Co. to Mr. Raymond B. Price, under date of December 14, 1899:

"Caustic soda is a solvent of sulphur, as has long been known, and is used extensively for a great many years. In fact, the National Rubber Co. used caustic soda for devulcanizing a great many years ago."

"Now I am anxious to develop this process and if there is anything that you can tell me that has been done in the past which belongs to the company, I shall be grateful to you for same, as it will save me from doing over what has already been done."

Another extract of interest in this discussion is the following, taken from a letter of Mr. Raymond B. Price to Mr. Robert Cowen, dated December 23, 1899. "Arthur" refers to Mr. Marks:

"As for the soda process, Arthur has no more right to a patent on that than has Ship Sweet, who first tried soda in the laboratory, or you, whose general ideas were carried out, or myself."

In view of the facts disclosed by the above letters is it conceivable that Mr. Cowen was, as you say, "wholly in favor of the acid process for reclaiming," or that were Mr. Cowen alive "he would, in his frank way, give Mr. Marks full credit for his process?"

Yours respectfully,

L. J. PLUMB, Chief Chemist,

October 19, 1914.

U. S. Rubber Reclaiming Co., Inc.

[The statement that Mr. Cowen did not claim the alkali process seems to be disproved by Mr. Plumb's very interesting communication. It is well to remember, however, that Mr. Cowen—and this is not meant to be derogatory—was an enthusiastic claimer and an honest one. He, for example, claimed to have started THE INDIA RUBBER WORLD. Possibly he did suggest a rubber trade publication to the writer. At all events the claim did no harm. He and others who generally stated that they, through suggestion, were its real founders, were never contradicted. The Editor.]

TO the Editor of THE INDIA RUBBER WORLD—DEAR SIR: The very interesting paper on "The Influence of Nitrogen Compounds on Rubber" which appeared in the September issue, has, I find, attracted considerable attention. The interest which has recently been shown in this subject prompts me to direct attention to several materials well known to chemists, but seldom if ever used by the smaller rubber-goods manufacturer who does not employ the services of an advisory chemist. There are several nitrogen compounds which come into consideration for rubber mixings because of their market price (about 10c. per pound in July, 1914). Among these may be mentioned casein, glue from tanneries and packing houses, fish glue and blood albumen. Several of these were recommended by me for use either alone or in combination, as early as the year 1910. At that time, however, rubber-goods manufacturers were loth to listen to such a "theory," in spite of the fact that German manufacturers were then actually making use of it. A younger chemist with some experience in rubber, assured me that "all such fancy additions to the compound have a bad effect on the rubber goods."

Other nitrogenous materials which might prove of value are powdered wood, which contains both nitrogen and sulphur; and powdered silk, which contains nitrogen. These materials in powdered form are both articles of commerce. One of the difficulties which might interfere with the use of such substances is their fibrous character and their moisture content. When precipitated gelatin is used in rubber compounds it should be previously mixed with glycerin or other softener.

Tetramino carbazol is an interesting aromatic amine obtained from coal-tar, and possibly this will prove of value as an accelerating agent in rubber mixings.

FREDERIC DANNERTH,

The Rubber Trade Laboratory, Newark, N. J.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

The Electrical Exposition and Motor Show of 1914.

THE Electrical Exposition and Motor Show of 1914 was held in the Grand Central Palace, New York, from October 7 to 17. In the extent and variety of exhibits and in the popular interest manifested it was the most successful show of this sort yet held. The attendance during the ten days ran close to the 200,000 mark.

While on the surface rubber was not greatly in evidence, it was, nevertheless, a very important feature of the exhibition. In fact, practically every exhibit there depended upon wires and cable insulated by rubber or gutta percha for its effective operation. Rubber-covered conductors made it possible to contribute the brilliant illumination which was an effective feature of the evening exhibit and to impart power to the great variety of machinery displayed. So, while rubber might not be called a conspicuous feature of the exhibition, there was much of it there if one but looked for it.

In the starting, lighting and ignition system of gasoline cars. Hard rubber enters into the construction of these batteries to a considerable extent. The battery jars, covers, vent-cap and the separator plates are all made of hard rubber, while soft rubber gaskets are used under the covers. One type of storage battery attempts to eliminate the use of hard rubber, but it is not wholly successful, as hard rubber insulation is still necessarily used on the bottom and sides of the jar and hard rubber strips are placed between the plates.

Pneumatic cleaners with rubber gaskets, rubber lined and armored hose and rubber-proofed dust bags were shown in great variety. The electrical washing machine that is guaranteed to save time and labor depends on the electrically operated wringer with its rubber-covered rollers to make it complete.

If you own a piano player and wish to avoid the exertion of pedaling there is a blower operated by electricity which will do

GRAND CENTRAL PALACE DURING THE ELECTRICAL EXPOSITION

For instance, there was an interesting apparatus exhibited by the Electrical Testing Laboratories for testing rubber gloves used by electrical workers. It subjects the gloves to a test of from 3,000 to 10,000 volts from one to five minutes. Unless they successfully withstand this test they are rejected as unfit for use.

There were various electric storage batteries which are used for operating autos, trucks and submarines. One type is used

ignition batteries can be charged from an ordinary alternating current lighting circuit. Another device of interest to automobilists was the tungsten contact for igniting. There was also shown a complete line of the Mazda lamps and fixtures for motion picture theatres, department stores, factories and street lighters. The motor exhibit consisted of motors from one two-hundredth of a horsepower to ten horsepower. House owners were interested in the bell ringing transformers, gong type transformers, toy transformers and the household ozonator.

The Westinghouse Electric & Manufacturing Co. had an elaborate display of electrical apparatus both for home and industrial use. The exhibit included a complete line of motors, heating apparatus, measuring instruments, protective devices and apparatus used in the generation and distribution of electric power. A striking feature was the new Luxsolite fixture showing the "Type C" Mazda lamp arranged for street lighting. The radiant toaster, an inexpensive device for making crisp toast, was one of the interesting culinary features of the exhibit. The Venturia and Sirocco types of ventilating outfits for homes and buildings were shown. A complete line of alternating and direct current motors for industrial, home and farm use, together with accessories used with each, attracted considerable attention. There was the pillar type flame arc lamp which is being extensively used in the illumination of the "White Ways" of cities and towns. This is an ornamental type of lamp which is very attractive.

In the division of Electro-Therapeutics there was a great variety of machines and apparatus in which both hard and soft rubber were in evidence. The comprehensive exhibit by the New York Edison Co. consisted of electrical appliances for the hospital, the general practitioner, for dental offices and the electrical insulation of a modern operating room. An X-ray outfit in which rubber plays an important part was a feature of this exhibit.

The Oxyoline apparatus used in the treatment of tuberculosis and which is attracting much attention among physicians, has considerable hard rubber and soft rubber tubing. There were machines for the treatment of high blood pressure, reducing machines, line irrigating equipments and various types of lamps for dermatological work—all of which use rubber in some form.

The Turner Detective Dictograph with hard rubber ear pieces, cover and keys and the "Acousticon," which is all hard rubber, are instruments of extreme interest, respectively, to the wrong-doer and the deaf.

The War Department of the United States Government exhibited field signalling apparatus and methods. Here insulated wire was in evidence. The Navy exhibit showing the navigating appliances, steering devices and signal system used on a modern battleship did not lack in rubber of some sort. In the control of a modern gun turret or gun fire control, in coast defence or artillery practice, the telephone plays an important part. The double head sets are provided with soft rubber ear pieces for protection. A modern rubber diving suit and a diver's lamp with its rubber gasket are part of every battleship equipment.

In the modern dairy the electric motor and india rubber have taken the place of the dairymaid. The cows are milked by means of an electrically driven vacuum pump, rubber teat cups and rubber tubing. There was in this exhibit a mechanical filling machine which with the aid of a soft rubber disc fills and caps the bottles of milk and cream.

In the model garage and charging station could be seen the various types of the Schaler Vul-Kit, Model B, Motorist Model and Garage Model Vulcanizers. These are electrically operated and guaranteed to satisfactorily repair any type of tire or inner tube.

EXHIBITION NOTES.

The Habirshaw Wire Co., Yonkers, New York, exhibited submarine cables used for mines and torpedoes, signal wires and cables used in electrical transmission as well as aerial automobile

cable. The features of the exhibit were the "Black Core," "New Code" and "Red Core" wires.

The General Vehicle Co. exhibited delivery vehicles. The solid tires used were the Firestone Removable and the United States Demountable.

The Ward Motor Vehicle Co. exhibited a small electric delivery wagon designed to meet the requirements of local tradesmen. The tires were Firestone Side Wire Quick Demountable S. A. E. The truck exhibited by this company use the Dual Firestone Side Wire Q. D. tires on both front and rear wheels.

The Detroit Electric Vehicle Co. exhibited three cars with Motz and Goodrich Silvertown Cord Tires. The control handles of the cars, switch and push keys were of hard rubber.

The Rauch & Lang Co. exhibited two limousines with Motz tires, rubber running board tread and hard rubber mountings on the doors and control handles.

The New York Edison Co. made an interesting exhibit of the method used in splicing electrical cables. There was a demonstration of the application of electricity in the manufacture of so-called artificial ice and refrigeration for the production of iceless ice cream.

Among the many "Safety First" devices for industrial plants was the Push Button Control exhibited by the General Electric Co. This is a simple, practical device for starting, stopping and controlling the speed of motors simply by pushing a button.

RUBBER CARGOES SUNK BY THE BELLIGERENTS.

The German cruiser "Emden" is reported to have sunk 15 or 16 merchantmen in the Indian Ocean. Among them was the "Troilus" which had, among other items of cargo, 1,200 tons of rubber. Another English steamer, the "Titan," is reported to have been set on fire at Port Said. Its cargo of rubber is estimated at somewhere from 300 to 500 tons. The British steamer "Indian Prince," which was sunk by the converted German cruiser "Kronprinz Wilhelm" September 9 off the Argentine coast, was on its way from Bahia to New York with a cargo of coffee and a shipment of 17 tons of Maniçoba rubber.

THE WAR MAKES HIGH INSURANCE RATES.

Rubber importers are feeling the effects of the war in excessive insurance rates. Inquiries on rates from Pará to New York are met with figures of from 1½ to 2 per cent., but on taking out the papers for an actual shipment, the rate is usually from 3 to 4 per cent., showing the uncertainties of trade during war time.

TRADE CONDITIONS AS SEEN BY RUBBER CLUB MEMBERS.

Early in October the Rubber Club of America sent out a series of questions to prominent rubber manufacturers throughout the United States to get their ideas on the business outlook. Nearly all of the letters were answered promptly and in detail and the replies were singularly unanimous.

From a careful comparison of the answers, one could be able at once to see that the rubber trade was in a fairly satisfactory condition. In the matter of collections, wholesale and retail, there has been a slight slowing up. The number of unemployed seems to be about the same as last year. Supplies of raw products during the last month have been normal, although deliveries during the early days of hostilities were slow and prices were raised for a time. Of manufactured rubber goods imported, a great many lines have been cut off entirely, but none that could not be produced in the United States. Manufacturers are looking with interest to outside markets and making some effort to secure them, but are cautious because of lack of credit facilities. The behavior of banks towards borrowers seems to be about normal.

News of the American Rubber Trade.

ANNUAL MEETING OF THE MCGRAW TIRE & RUBBER CO.

AT the annual meeting of The McGraw Tire & Rubber Co., held at the company's offices at East Palestine, Ohio, on October 1, a very satisfactory year's business was reported. The following officers were elected for the year: President, E. C. McGraw; vice-presidents, R. W. McGraw and John Morgan; secretary, L. M. Kyes; treasurer, John Morgan.

A conference of the branch managers and sales force of the McGraw company was held during the week commencing October 5, when plans were laid for an extensive distribution of product for the coming year. The company reports an exceptionally bright outlook.

BOSTON WOVEN HOSE & RUBBER CO.

At the annual meeting of the Boston Woven Hose & Rubber Co., held early in October, the board of directors was re-elected for the ensuing year, and it was voted to change the by-laws to permit the election of more than one vice president. This company is experiencing no difficulty in obtaining all necessary supplies of crude rubber at satisfactory prices, and reports that while its European business has been unfavorably affected by the war, trade in general is holding up fairly well, and the directors are optimistic as to rubber trade conditions.

WESTINGHOUSE AIR BRAKE CO.'S ANNUAL REPORT.

The consolidated statements of the Westinghouse Air Brake Co. covering the fiscal year ending July 31 show net earnings for the year of \$3,482,993, a decrease of \$2,581,784 from the earnings of the preceding fiscal year. The annual inventory totals \$5,625,023, against the July, 1913, inventory of \$4,307,505, while the cash on hand is given as \$2,479,095, and accounts and bills receivable as \$3,132,723 against similar items for the previous year of \$4,050,495 and \$4,865,762. The statement shows a surplus of \$5,648,495, which is \$145,807 in excess of that shown on August 1, 1913.

MAGNETIC CLUTCHES FOR NATIONAL INDIA RUBBER CO.

The Cutler-Hammer Clutch Co., of Milwaukee, Wisconsin, has just closed a contract with the National India Rubber Co., of Bristol, Rhode Island, through Messrs. Lockwood, Green & Co., consulting engineers, Boston, for two 72-inch H-60 magnetic clutches and one 72-inch H-75 clutch. The 72-inch H-60 clutches will be used on shafts where they will be called upon to transmit 600 H. P. at 60 R. P. M., while the 72-inch H-75 clutch will be employed for the transmission of 400 H. P. at 36 R. P. M.

These clutches are being installed for the protection of workmen engaged in and about the mill, and were selected after a careful investigation of the merits of the various types of mechanical clutch, as well as the features of the Cutler-Hammer product.

RUBBER COMPANY DIVIDENDS.

The Hood Rubber Co. has declared the twenty-seventh consecutive quarterly dividend of $1\frac{3}{4}$ per cent. on its preferred stock—payable November 2 to stockholders of record on October 28.

The Swinehart Tire & Rubber Co., of Akron, has declared a dividend of 6 per cent. for the coming year—payable quarterly.

The United States Rubber Co. paid on October 31 quarterly dividends of 2 per cent. on first preferred, $1\frac{1}{2}$ per cent. on second preferred and $1\frac{1}{2}$ per cent. on common stock of the company, to stockholders of record on October 15.

The Electric Hose & Rubber Co., of Wilmington, Delaware, at its annual meeting held October 20, declared a regular dividend of 3 per cent. and an extra dividend of 1 per cent. for the six months ending September 30, making a total dividend paid for the year of 8 per cent.

CHANGES IN CAPITAL STOCK.

The capital stock of the Continental Rubber Works, of Erie, Pennsylvania, has been increased \$1,000,000.

The Racine Rubber Co., of Racine, Wisconsin, has increased its capital stock from \$1,000,000 to \$1,500,000, divided into 5,000 shares of preferred and 10,000 shares common, each with a par value of \$100 per share.

The East Palestine Rubber Co., of East Palestine, Ohio, has increased its capital stock from \$150,000 to \$500,000.

CHANGES IN THE UNITED STATES TIRE CO. FORCES.

O. S. Tweedy, who ever since the formation of the United States Tire Co. has been its Eastern District manager, has been promoted to the position of assistant general sales manager. Mr. Tweedy will continue to supervise the Eastern territory and will also look after the trade of the Central District. He is a thoroughly experienced tire man, having been associated for ten years with the Diamond Rubber Co., for two years with the Federal Rubber Manufacturing Co., as general sales manager, and also with the Continental Caoutchouc Co., as New York sales manager.

Thomas Burton, who has been assistant manager of the Eastern District, has been transferred to Atlanta, Georgia, succeeding T. B. Goodloe, who will join the New York sales force.

George S. Shugart, of the Central District, with headquarters at Chicago, has been given the title of District Manager.

O. S. Johnson, formerly manager of the Buffalo branch, has been transferred to Houston, Texas, to succeed W. F. Gordon as Texas State manager, Mr. Gordon having resigned his position with the company to open an automobile agency at Dallas.

A NEW HARD RUBBER COMPANY.

The India Rubber Co. has just begun the manufacture of hard rubber goods in a newly equipped plant in New Brunswick, New Jersey. It will manufacture hard rubber battery jars—having a capacity of 500 jars per hour—and also caps and barrels for fountain pens and other hollow molded and turned hard rubber material. The plant is in charge of Mr. H. Weida, who has had fifteen years' experience in hard rubber manufacture. For ten years of that time—up to the first of April last—he was manager of the hard rubber department of the Diamond Rubber Co., and had previously been connected with the American Hard Rubber Co. and the Peoples Hard Rubber Co.

CONNECTICUT TIRE FABRIC MILLS BUSY.

The Connecticut manufacturers of tire fabrics are rushed with orders. The Manhasset Manufacturing Co., at Putnam, is running night and day on orders, while the Killingly Manufacturing Co., at Williamsville—a subsidiary of the Goodyear Tire & Rubber Co., of Akron—has found it necessary to increase its equipment and capacity, to meet the demands of the Goodyear company, which takes its entire output. The \$50,000 worth of new machinery recently purchased for this plant is being installed and by the first of January it is expected that it will have a producing capacity of 1,500,000 yards of tire fabric a year.

AMERICAN COTTON GOODS FOR EUROPE.

It is reported that some two million yards of cotton duck have recently been sold to Europe for army orders; the trade having been practically all done through a few houses on this side with European representatives. Inquiries have reached here for further large quantities, but in a more or less indefinite shape. English demands have largely been for cotton goods to a certain specification.

THOMAS ALEXANDER FORSYTH.

THOMAS ALEXANDER FORSYTH, president of the Boston Belting Co., was born in Brookline, Massachusetts, April 12, 1852. He is the fourth son of William Forsyth, who came to this country in the early part of last century, from his home in Ayrshire, Scotland.

The family is an ancient one, tracing its ancestry back to Cadet de Forsath, a member in the train of Eleanor, daughter of Raymonde, Comte de Provence, when she went to England in 1236 and married Henry III, King of England. The son, William de Forsath, in 1296, according to the records, took the oath of fealty to King Edward I, of England, who at that time was at war with Philip IV, of France. A straight, unbroken line from these ancestors is on record.

William Forsyth, son of Captain John Forsyth, of the British army, came to Boston in 1828, moved to Brookline and later to Roxbury, to be near the factory of the Boston Belting Co., in which he was a foreman. The family consisted of five sons and three daughters, and as the sons left school they were employed in that factory.

Thomas A. Forsyth, though born in Brookline, was educated in the public schools in Roxbury, which is now a portion of Boston. At the age of fourteen he went into the factory of the Boston Belting Co. and, beginning at the bottom, became successively an experienced workman, foreman, assistant superintendent and superintendent; and on the death of his brother he became president of the company. Knowing the entire details of the business from the receipt of the raw materials to the shipment of the finished product, he is especially fitted for the position, as the steady, continued success of the company and its increasing business fully prove.

Being, like all his family, mechanically ingenious, he, with his brother James, worked out many problems of manufacture and made several important improvements in the machinery of the factory, also solving some intricate problems in the manipulation of rubber and the details of manufacturing the goods for which the company is noted. For several of these improvements he has secured patents.

Two of Mr. Forsyth's traits are worthy of mention, namely, his desire for perpetuating the memory of his family, and his broad philanthropy. Mention has been made in this journal of the beautiful window in memory of the family in a prominent church in Roxbury, and of the baptismal font and rose window dedicated to his sister Margaret; but his great philanthropy, one which has no duplicate in the world, is the gift to the city by the late John Hamilton Forsyth and Thomas A. Forsyth of the Forsyth Dental Infirmary for Children, founded in memory of their brothers, James Bennett and George Henry Forsyth. This magnificent building, which will be opened this month, is one of the most beautiful of all the ornate structures in Boston's Fenway.

It is the outcome of a report of a systematic examination

of the children in Boston's public schools, conducted by the late Dr. Gallivan. Of the 118,000 pupils examined over 51,000 were found to have defective teeth, while other defects originating in the mouth brought the total up to 84 per cent. of all defects found.

Andrew Carnegie was asked to found an institution where such defects could be alleviated and cured, or by timely treatment wholly prevented. He was more interested in libraries than infirmaries, and declined, so the opportunity came to this Scotch-American family to found, build and endow a charity which will be—in fact, already is—world famous.

Mr. Forsyth is greatly interested in art, being a member of the Art Museum and the Boston Art Club. He is vice-president of the Forest Hills Cemetery Corporation, and is on the Board of Overseers of the Poor of the City of Boston. He makes his home at one of Boston's leading hotels. A spacious room has been set apart on the first floor of the infirmary named "The Founders' Room," which will not only contain memorials of the Forsyth family, but will also house his extensive library and works of art. Here doubtless he will spend many of the hours which he may find himself able to spare from his office in the factory in Roxbury.

THOMAS A. FORSYTH.

PERSONAL MENTION.

Henry Spadone, president of the Gutta Percha & Rubber Manufacturing Co., of New York, has been elected a director of the Importers' & Traders' National Bank of that city.

James C. Brady, a director in the United States Rubber Co., and son of the late Anthony N. Brady, was married on October 14, to Lady Victoria May Pery, daughter of the Earl and Countess of Limerick, of Dromore Castle, Limerick, Ireland. The wedding took place at the home of Mr. Brady's brother,

Nicholas F. Brady, at "Sea Verge," Monmouth Beach, New Jersey. Mr. and Mrs. Brady are now at the New Greenbrier Hotel, White Sulphur Springs, West Virginia, where they will remain for several weeks.

J. W. Whitehead, for the past eight years assistant sales manager of the California branch of the Diamond Rubber Co., has resigned that position to assume charge of the Pacific Coast business of the Norwalk Tire & Rubber Co., of Norwalk, Connecticut.

Fred Harrington, formerly connected with the Firestone Tire & Rubber Co.'s branch at Philadelphia, has been promoted to the management of the Detroit agency.

A. I. Butler, formerly manager of the Brooklyn branch of the Goodyear Tire & Rubber Co., is now special representative in northern New York territory for the Batavia Rubber Co., of Batavia, New York.

H. M. Applegate, formerly advertising manager for the Lee Tire & Rubber Co., of Conshohocken, Pennsylvania, has become associated, in a similar capacity, with the Rutherford Rubber Co., of Rutherford, New Jersey.

COL. COLT CONDEMNNS UNNECESSARY HOARDING.

President Samuel P. Colt, in commenting upon the action of the board of directors of the United States Rubber Co. in declaring the regular quarterly dividends upon the preferred and common stocks of the company early in October, said:

"The dividends having been amply earned and the finances of the company being in easy condition—with \$8,000,000 of cash on hand—I think the action of the board not only conservative, but one that is entitled to commendation in these times of war and financial stress. The division of \$1,700,000 at this time among the 15,000 stockholders of the company will, I am satisfied, do much good and be most thankfully received."

President Colt also condemned the unnecessary hoarding of money by either banks or other corporations.

MR. FERREIRA VISITS NEW YORK

Mr. Adelino A. Ferreira, representing Leite & Co., Inc., a prominent rubber house of Pará, Brazil, made a two weeks' visit to New York during the latter half of October. The purpose of this visit was the promotion of trade facilities between Pará and New York through the establishment in the former city of New York bank representation, and negotiations tending toward such arrangements are understood to be now under way as a result of Mr. Ferreira's representations to prominent New York bankers.

PERSONAL MENTION.

Mr. A. Terry, of A. Terry & Co., 8 Haydon street, Minories, London, E. C., who was agent for large Austrian and German concerns in mechanical rubber goods, druggists' sundries and waterproofing, is looking for suitable American connections. He visited the United States the latter part of October and made two connections in other important lines and now desires to correspond with manufacturers in those named above.

Mr. Ernest E. Buckleton, president and general manager of the North Western Rubber Co., Ltd., is in the United States at the present time on a brief visit.

On October 16, Mr. S. George Mills completed twenty-two years of continuous service with C. J. Bailey & Co., prominent Boston rubber goods dealers. Mr. Mills has an exceedingly genial personality, and is one of the most successful retail rubber salesmen in the country.

TRADE NEWS NOTES.

Revised plans are being prepared for a factory and office building for the Santo Rubber Co. at Niagara Falls, New York, and bids will soon be taken. The cost of this building, the main section of which will be of brick construction, 82 x 250 feet in area, two stories high, has been estimated at \$100,000.

The Safety Signal Co. has been incorporated in New York, with an authorized capital of \$200,000, to manufacture devices for automobiles, rubber goods, etc. The Incorporators are Arthur W. Dennen, Stanley C. Fowler and Rebecca Hilliker.

THE GENERAL MANAGER OF THE THERMOID.

THE Stokes family of three and more generations back were iron men, first in England and later in the United States. Of them the most widely known was the late Joseph Stokes, who for years directed the destinies of the great New Jersey Steel & Iron Co. and its five thousand men. Today the descendants of the "iron master" are rubber men, and it is one of them who is the subject of this sketch.

Mr. Robert J. Stokes, manager of the Thermoid Rubber Co., grandson of Joseph Stokes and son of William J. B. Stokes, was born in Trenton, New Jersey, thirty one years ago. After attending the State Model schools in his native city he entered Princeton College, graduating with honors in 1904. With a decided taste for mechanics, a good knowledge of chemistry and possessing in a marked degree the family trait of organization, it was natural that he should turn toward rubber manufacture. He therefore entered the Thermoid factory, learned the business from the ground up, became foreman, superintendent and general manager. In 1908 he married the daughter of the late Judge Jonathan Dixon, of Jersey City.

Mr. Stokes is a genial, athletic, popular, six footer, enthusiastic in his work and, in addition, is more than excellent in such sports as tennis and golf.

ROBERT J. STOKES.

THE RUBBER TRADE ASSOCIATION OF NEW YORK.

In the September issue of this publication mention was made of the preliminary steps which had been taken by rubber importers in New York toward effecting an organization for their mutual benefit. The first meeting was held on August 12, with a second meeting two days later at which a committee was appointed to outline a plan for the proposed association.

This committee having drawn up a constitution and by-laws, a meeting was called on October 23 at 80 Maiden Lane, New York, and the association was definitely organized, under the name of the Rubber Trade Association of New York. A constitution and by-laws were adopted; initiation fees and dues were placed at \$25 each, and the following officers, directors and committee members were elected:

OFFICERS.—Wm. E. Bruyn, president; Ed. Maurer, vice-president; Wm. H. Stiles, treasurer; Ed. Weber, secretary. DIRECTORS.—H. A. Astlett, Chas. T. Wilson and Ed. Weber, three years each; R. W. Earle, F. R. Henderson, Ed. Maurer and Wm. H. Stiles, two years each; F. G. Gove, Wm. T. Baird, W. G. Ryckman and Wm. E. Bruyn, one year each.

MEMBERSHIP COMMITTEE.—Chas. T. Wilson (chairman), Wm. T. Baird, Wm. H. Stiles, R. W. Earle, A. B. MacNamara, G. Singleton, R. L. Chipman. ARBITRATION COMMITTEE.—Ed. Maurer (chairman), F. R. Henderson, Fred'k G. Gove, Wm. H. Stiles, Chas. T. Wilson.

CONTRACT COMMITTEE.—Wm. T. Baird (chairman), Wm. E. Bruyn, Ed. Maurer, Wm. H. Stiles, E. Korn, Chas. T. Wilson. HOUSE COMMITTEE.—F. R. Henderson, Chas. T. Wilson.

NEW INCORPORATIONS.

B & K Specialty Manufacturing Co., October 9, 1914; under the laws of New Jersey; authorized capital, \$50,000. Incorporators: Lester W. King and U. Grant King—both of 1101 Greenwood avenue—and Solomon Berman, 153 South Broad street—all in Trenton, N. J. To buy, sell, export, manufacture and assemble rubber goods, electrical goods, and all goods of which rubber is a component part.

Boska Manufacturing Co., Inc., October 14, 1914; under the laws of New York; authorized capital, \$100,000. Incorporators: Chas. F. Saunders, 164 Sherman avenue, R. W. Wason, 607 West One Hundred and Thirty-ninth street—both in New York, N. Y., and Simon F. Peavey, Jr., 151 Columbia Heights, Brooklyn, N. Y. To manufacture rubber tires and tire fillers.

DeSilva Rubber Co., Inc., The, October 19, 1914; under the laws of New York; authorized capital, \$10,000. Incorporators: A. Martin DeSilva, 210 West One Hundred and Ninth street, Harry E. Fry, 886 Third avenue, and Edward Wagner, 349 East Fifty-second street—all in New York, N. Y. To manufacture rubber goods of all kinds, in particular, rubber heels.

Eastern Rubber Co., October 6, 1914; under the laws of Massachusetts; authorized capital, \$90,000. Incorporators: Christopher Brien, 37 Larned street, West Detroit, Mich.; Fred C. Miskelly, 217 Proctor avenue, Revere, and Jane A. Hay, 381 Talbot avenue, Dorchester—both in Massachusetts. To manufacture and deal in rubber goods, coats and garments, boots, shoes, rubbers and all kinds of leather, rubber and cloth goods and novelties.

Goodyear Tire & Rubber Co., Inc., The, October 14, 1914; under the laws of New York; authorized capital, \$1,000. Incorporators: James W. Hobbs, 1972 Broadway, George Norris and Francis K. Raynor—both of 115 Broadway—all in New York, N. Y. To represent the Ohio corporation of similar name in Eastern United States, and to deal in its products.

Greenville Fisk Tire Co., The, September 21, 1914; under the laws of South Carolina; authorized capital, \$5,000. Incorporators: T. H. Cunningham and M. C. Westervelt. To deal in automobile tires and accessories.

Johnson Pneu-Metal Tire Co., October 2, 1914; under the laws of Massachusetts; authorized capital, \$1,000,000. Incorporators: Fred I. Johnson, Prospect street, Fitchburg; James H. Duffy, 18 Tremont street, and William P. Meehan—both of Boston—all in Massachusetts. To deal in tires.

Neptune Packing & Rubber Co., Inc., October 16, 1914; under the laws of New York; authorized capital, \$5,000. Incorporators: Katherine V. Du Bois and James F. Du Bois—both of 31 Third avenue, New Brighton—and Frank X. Feury, 16 Haven Esplanade, Tompkinsville—all in New York, N. Y. To manufacture packing and rubber goods, and engineers' and machinists' supplies.

Reliable Tire & Rubber Co., September 25, 1914; under the laws of New Jersey; authorized capital, \$24,000. Incorporators: Albert Numbers, Erastus L. Irving and Arthur R. Colvin—all of Trenton, N. J. To manufacture, purchase, trade and deal in automobile tires, inner tubes and all other automobile accessories and other kinds of rubber.

Reliable Tire & Supply Co., Inc., October 5, 1914; under the laws of New York; authorized capital, \$5,000. Incorporators: Bluma Skoson and Estelle Skoson—both of 934 East One Hundred and Seventy-ninth street, and Louis H. Lex, 429 West Thirtieth street—all in New York, N. Y. To deal in all lines connected with the auto industry.

Safety Auto Tire & Tread Co., September 21, 1914; under the laws of New Jersey; authorized capital, \$50,000. Incorporators: Cornelius D. McGiegan, 2 Pearsall avenue, Jersey City, N. J.; Charles Vail, 29 Broadway, and George A. Honnacker, 309

Broadway—both of New York, N. Y. To sell and repair automobiles and to construct and repair and sell automobile rubber tires.

Safety Tire Co., Ltd., The, September 2, 1914; under the laws of Canada; authorized capital, \$1,000,000. Incorporators: Joseph Georges Frenette, Arthur Moisan, Achille Begin, Ernest Taschereau and Armand La Vergne—all of Quebec, Canada. To manufacture wheels, rims, tires, etc.

Small Co., F. O., September 30, 1914; under the laws of Massachusetts; authorized capital, \$25,000. Incorporators: Frank O. Small, 444 Southamptton street; Paul A. Peters, 53 Lincoln street; Walter Bates Farr, Nelson B. Todd and Edward N. Chase—all of 179 Lincoln street—all in Boston, Mass. To manufacture, buy and sell rubber, rubber substitutes and compounds, etc.

Standard Tire & Rubber Co., September 11, 1914; under the laws of South Carolina; authorized capital, \$5,000. Incorporators: J. D. Bridges (president and secretary) and S. E. Brown (treasurer). Principal place of business, Greenville, S. C. To buy and sell automobile supplies of every kind and description whatsoever, and bicycles.

Star Tire & Rubber Co., July 31, 1914; under the laws of Wisconsin; authorized capital, \$5,000. One of the incorporators being John W. Mart, 2104 East Mifflin street, Madison, Wis. To manufacture, sell and purchase tires.

Southwestern Rubber Co., September 14, 1914; under the laws of Texas; authorized capital, \$25,000. Incorporators: Niels Esperon, F. R. Reese and W. N. Grafius—all of Houston, Tex. To buy and sell goods, wares and merchandise of any description by wholesale, or by wholesale and retail.

Weinman Elastic Web Co., Inc., October 17, 1914; under the laws of New York; authorized capital, \$15,000. Incorporators: Isak Weinman, 80 Walker street; Leo Weinman, 50 Leonard street—both in New York, N. Y.—and Jos. Sherline, 156 Van Buren street, Brooklyn, N. Y. To manufacture elastic web, cloth and fabric, of which rubber is a component part.

Western Sales Corporation, October 19, 1914; under the laws of New York; authorized capital, \$15,000. Incorporators: Chas. H. Taylor, Thomas Catlin and Sherman A. Hooker—all of 1330 Marine Bank Building, Buffalo, N. Y. To manufacture and deal in tire fillers, auto accessories, etc.

Williams Tire & Rubber Co., September 30, 1914; under the laws of Pennsylvania; authorized capital, \$5,000. Incorporators: Joseph A. Stabler, Jr., Samuel R. Birch—both of Glassport—and Thomas Young, McKeesport—all in Pennsylvania. To manufacture pneumatic tires out of rubber and rubber products for automobiles, bicycles, etc., and the manufacture of other articles of rubber and rubber products.

THE KING RUBBER CO.

The King Rubber Co., of Hyde Park, Massachusetts, which commenced manufacturing in June last, is at present specializing in seamless rubber gloves, both household and surgical. Equipment is being secured, however, for the manufacture of transparent nipples, a line of which it is intended to produce to replace those formerly imported from Germany and Austria. The production of other seamless rubber goods will follow, including tobacco pouches, bathing caps, etc. The company reports excellent progress and an encouraging outlook. W. W. MacDonald, formerly technical expert with the Davidson Rubber Co., of Boston, is associated with this enterprise. M. D. Kingsbury, formerly purchasing agent for the Davidson company and for the Boston Woven Hose & Rubber Co., is in charge of the office; while J. A. Crowley, well known in the drug and sundry lines, is the company's sales representative in New York and vicinity.

GOOD RECORD FOR "VACUUM CUP" TIRES.

The test of Oilproof Vacuum Cup tires inaugurated last March has recently been completed and results in a fine record, the total distance recorded for the nine tires on trial being 60,772 miles, or an average of 6,752 miles for each tire. This test was made under the direction of the laboratory of the Automobile Club of America, official observers of the club accompanying the drivers of the cars on which the tires were used, and all the tires were purchased by the club, from different dealers in several eastern cities, so that only stock tires should be employed in the test. The average mileage for tires used on wire wheels was 5,470; on wood wheels 8,076.

The Pennsylvania Rubber Co., of Jeannette, Pennsylvania, which makes the Vacuum Cup tire, has brought suit against the Dreadnaught Tire & Rubber Co., of Baltimore, Maryland, in an effort to restrain the latter company from use of the terms "Vacuum Tread" and "Vacuum Cup Tread" in connection with its tire product.

THE UNION RUBBER & SUPPLY CO. TAKES LARGER QUARTERS.

The Union Rubber & Supply Co., of St. Louis, Missouri, announces its removal from 410 Market street to larger and more conveniently located quarters at 18 South Broadway, in the district known as the "White Way." This company, which has made continued progress since its establishment thirteen years ago, carries a complete line of mill supplies, including balata and leather belting; fire department equipment; automobile tires, and a full line of the Revere Rubber Co.'s rubber belting, air and water hose, valves and sheet and piston packings.

RECEIVER APPOINTED FOR OVERMAN TIRE CO.

A petition in bankruptcy has been filed against the Overman Tire Co., Inc., and a receiver appointed by the court, authorized, under a bond of \$5,000, to continue the carrying on of the business for a certain period. The company's liabilities are given as between \$60,000 and \$70,000, and the assets \$60,000. This company, located at 250 West Fifty-fourth street, and with salesrooms at 1855 Broadway, New York, was incorporated in February, 1913, under the laws of Delaware, with a capital stock of \$3,000,000.

THE NELSON SURF COASTER.

The cut below shows a new device for surf coasting introduced this season at Long Beach, California, and reported to have become quite popular at that resort. While designed primarily for sport and amusement, it may be used also as a safety device in case of cramps or accidents. This coaster

is made with rigid frame and air-tight compartment entirely covered with waterproof canvas. It varies in size from 2 to 7 feet in length and from 10 to 18 inches in width and weighs from 3½ to 9 pounds. [Nelson & Woods Manufacturing Co., Long Beach, California.]

TRADE NEWS NOTES.

The Peerless Tire & Rubber Co. has been incorporated at Louisville, Kentucky, to carry on a jobbing and distributing business in tires and tubes, rubber accessories and mechanical rubber goods. It is located at 624-6 South Third street, has a capitalization of \$15,000 and is controlled by men thoroughly acquainted with the rubber goods trade.

The New York branch of the Braender Rubber & Tire Co., of Rutherford, New Jersey, will soon remove from 1987 Broadway to larger quarters at 250 West Fifty-fourth street.

I. Novick & Co., manufacturers of coats and raincoats at 133 West Twenty-first street, New York, have filed schedules in bankruptcy showing liabilities of \$50,331, and assets amounting to \$13,100.

At the autumn festival held October 17 in connection with the Grill dances at the Plaza Hotel in New York, a toy balloon blowing contest was one of the special features of the evening's entertainment.

A method of effecting tire economy which can easily be followed by motorists generally has been adopted by an ingenious tire user. He places a worn-out casing over a good one, making slits across the outer casing about 4 inches apart, to give a non-skid effect.

A fourth story has been added to the brick and concrete warehouse on Schuylkill avenue, Philadelphia, owned by the Philadelphia Rubber Works Co. The cost of this addition is estimated at \$15,000.

The Williams I X L Tire & Rubber Co., a corporation capitalized at \$300,000, has purchased a site at Buena Vista, Pennsylvania, for a plant to manufacture automobile tires and other rubber goods.

The York Co-operative Tire & Rubber Co., of New Orleans, Louisiana, is said to be looking about for a suitable site for a factory for the manufacture of tires and a new tire fabric. Leslie Dunn, president of the company, recently visited Canton, Ohio, with this end in view, the proposed plan calling for the erection of a factory equipped to turn out 2,000 tires daily, and providing that only automobile owners shall be stockholders in the concern.

Insulated wire and cables to the value of \$127,697 were exported from the United States during July of the present year. Similar shipments for July, 1913, amounted to \$147,948.

The plant of the Patterson Rubber Co. at Lowell, Massachusetts, will be sold at public auction on October 31 as a result of foreclosure of the mortgage held by Francis H. Appleton, one of the organizers of and principal stockholders in the concern. This is a comparatively new plant, and it is believed that work will not be interrupted but that several of the present stockholders will unite in reorganizing the company.

A test of car and tire endurance was recently made by Henry J. Adams, of Fostoria, Ohio, on a 3,000-mile trip, which included all the principal cities from Cleveland to Montreal, thence to Boston, Baltimore, and across the Alleghany Mountains into West Virginia and back into Ohio. This trip was made in a Reo car equipped with tires made by the Miller Rubber Co., of Akron, Ohio. At the end of the trip Mr. Adams reported as follows: "The tour lasted twenty-five days, and the tires are good for another trip."

C. A. Dunham, for the past three years manager of the Pittsburgh branch of The B. F. Goodrich Co., has been promoted to the management of a larger branch at Cleveland, Ohio. Before leaving for this new field Mr. Dunham was presented with a diamond scarf pin by the employees of the Pittsburgh branch. The position vacated by his transfer will be filled by F. E. Titus, formerly located at Buffalo, New York.

MR. C. E. SIEGFRIED.

Mr. C. E. Siegfried, who, as stated in our October issue, has become the Akron representative of Charles E. Wood, the crude rubber broker of New York, has had quite an extended experience in the rubber industry. For eight years he was connected with the Goodyear Tire & Rubber Co., being for three years in charge of their molded goods sales department. He has also had charge of the same department in the Miller Rubber Co. He has traveled extensively in the West, where he is well acquainted with the rubber trade.

C. E. SIEGFRIED.

EXHIBITORS AT THE AUTOMOBILE SHOWS.

At the automobile shows to be held by the National Automobile Chamber of Commerce in New York and Chicago, under dates of January 2-9 and January 23-30, respectively, the following accessory manufacturers will have exhibits: Double Fabric Tire Co., Auburn, Indiana; Voorhees Rubber Manufacturing Co., Jersey City; A. Schrader's Son, Inc., Brooklyn; C. A. Shaler Co., Waupun, Wisconsin; F. S. Carr Co., Boston; Leather Tire Goods Co., Niagara Falls, and the Pantasote Co., New York.

TRADE NEWS NOTES.

W. T. Kyle has joined the sales force of The Okonite Co. at the company's general office, 253 Broadway, New York City. Mr. Kyle has been for the past six years connected with the Duplex Metals Co., as district sales manager.

A voluntary petition in bankruptcy was filed on October 19 by the National Insulate Co., of Springfield, Massachusetts, with liabilities \$13,839; assets \$7,610.

The Revere Rubber Co., of Providence, Rhode Island, has received a large order for solid tires to equip trucks being made for the French and Russian governments.

The United States Circuit Court of Appeals has affirmed a decree of the District Court in an opinion handed down in the suit of the Haskell Golf Ball Co. against the Sporting Goods Sales Co., for infringement of Patent No. 622,834, issued April 11, 1889, to Work & Haskell, on a golf ball. The court finds the patent of the complainant was valid and was infringed by the defendant. The patent covers a composite ball of rubber, the golf ball used for fifty years prior to that time having been made of gutta percha.

The Allen Auto Specialty Co., of New York, has brought suit against E. G. Baker, of the same place, for infringement of the Nathan tire case patent No. 799,622 owned by that company. Mr. Baker is the New York representative of the Gilbert Manufacturing Co., of New Haven, Connecticut, which manufactures tire covers, fleece-lined rubber covers and other accessories.

The Rubberset Co., Ltd., has been incorporated at Toronto, Ontario, with a capital stock of \$40,000 to manufacture rubber goods. Among the incorporators are J. W. Pickup, James Aitchison and Duncan McArthur.

The Chester Rubber Tire & Tube Co., of Chester, West Virginia, has purchased additional ground and will enlarge its plant.

The F. O. Small Co. has been incorporated in Boston with a capital stock of \$25,000 to manufacture and deal in rubber pulp, leather, etc.

The Atlas Rubber & Belting Co., of Cincinnati, Ohio, has increased its capital stock from \$1,000 to \$10,000.

The H. Phillips Rubber Co., of New York, has been petitioned into bankruptcy, with liabilities of \$12,000, and assets valued at \$8,000.

At a meeting of the consuls general in New York of Latin American republics, the Latin American Consular Association of New York was formed, the aim of which is to promote trade between the United States and the countries represented. Fifteen of the twenty Latin American consuls general in New York are members of this new association.

Employees of the Firestone Tire & Rubber Co., Akron, have contributed \$68 to the Red Cross Fund for the aid of the European war sufferers.

The Avon Tire Co., of Lynn, which recently purchased and moved into the plant formerly occupied by the Sagamore Rubber Co. at East Saugus, Massachusetts, is now operating, with a force of about 100 employees, turning out a line of solid tires.

The American Steel & Wire Co., which manufactures rubber covered and other wires, is planning the erection of a one-story building at the north works of its plant at Worcester, Massachusetts. This building will be 72x108 feet in area, and will be used for storage purposes.

A cable from London on October 1 stated that the embargo on the exportation of aniline oil had been raised.

In a recent address by the buyer for a prominent Boston shoe concern, manufacturers and retailers were jointly advised to make an effort to continue rubber soles and to push felt soles to the front "as a fad for the faddists who can afford them." It was stated that if 10,000,000 pairs of rubber or felt sole shoes could be sold next season it would greatly relieve the pressure on sole leather.

The Livingston-Hinkle Rubber Co. has been formed at Columbus, Ohio, by G. E. Livingston, former manager of the B. F. Goodrich Co.'s branch in that city. The new company will deal in automobile tires and accessories.

The Boston Rubber Shoe Co., of Malden, Massachusetts, is about to open a carriage cloth department, which will turn out a specially high grade of rubber ducks and drills, having ample facilities for manufacturing large quantities at short notice.

The Detroit Insulated Wire Co., of Detroit, Michigan, is enlarging its manufacturing facilities by the erection of two new buildings, respectively, 57x138 and 35x50 feet in area. The general offices of the company will be located in one of these additions, while the present office quarters will be used for factory purposes. Additional machinery equipment for the new buildings has been arranged for.

The Consumers' Accessories Co., of Indianapolis, has placed on the market a tire built exclusively for Ford cars. This is known as an over-size tire, the reason given being that the fabric and tread are 25 per cent. heavier than the ordinary tire of this type. It is made in two sizes only—30x3 and 30x3.5 inches—specialization in these two sizes minimizing cost.

The Parsons Non-Skid Co. and the Weed Chain Tire Grip Co., of New York, have secured an interlocutory decree against the Leather Tire Goods Co., also of New York, to restrain the latter company from marketing a device held to be an infringement of the Weed patents.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent

THE output of the Akron rubber factories for the past month is roughly estimated to have been about 50 per cent of their maximum product. One or two plants are running on practically full time, with a full quota of men, while others are running on only part time.

This city has been the center of reunions and conventions during the month. Early in October there was a legislative reunion, when many of Ohio's legislators and officials interested in safety measures visiting the city were shown through the factory of The B. F. Goodrich Co. in an unofficial inspection of the safety devices and measures adopted by this company for the protection and welfare of its employees.

Then there was the annual sales convention of the Firestone Tire & Rubber Co., attended by about 250 out-of-town representatives. The branch managers arrived Tuesday, the 13th, and after a day spent in planning for the larger convention of the following two days, were tendered a banquet at the Portage Country Club. By the morning of the 14th all the regulars had arrived. The day was fully occupied, speeches of welcome being followed by general discussions of such important subjects as carriage, cycle, motor and pneumatic tires and rims, and by a visit through the tire factory. On Thursday, the 15th, a visit was made to the rim plant, and the subjects considered in con-

outcome upon the rubber trade, on account of the European war, will be. I am very optimistic myself, and look forward to an unusually prosperous year of 1915.

"The only uncertainty now is the source of the crude rubber supply. We had hoped that the English and French control of the sea would have cleared this up before now. There are two uncertain elements. One is our lack of merchant marine, and the other is the lack of trade between this country and the countries supplying rubber.

"As it is now, it is necessary for rubber to come through Europe, on vessels to go empty to secure the rubber, which makes the freight carrying cost and insurance very high. We will gradually shape ourselves to supply the things they want in exchange for the rubber, which will relieve the situation.

"It seems like America's opportunity. If our manufacturers and business men go about it properly, and seek to secure the trade of these Eastern markets, by furnishing to their people the things they want and need, in exchange for what we want and not try to establish an unhealthy condition by forcing upon them something we have a surplus of and they do not want, we will establish a trade relation that will be lasting and beneficial."

The Williams Foundry & Machine Co. has been exceptionally busy and is adding a one-story building 60 x 100 feet in area to its plant, at an estimated cost of \$12,000.

The new addition of the Adamson Machine Co. is nearing completion.

* * *

The Miller Rubber Co. has recently perfected and patented a

SALES FORCE OF THE FIRESTONE TIRE & RUBBER CO., AKRON, AT CONVENTION.

vention on this date included credits, export business, branch efficiency, advertising, the European situation and salesmanship. The dinner in the banquet hall of the Portage Hotel, which concluded the convention, was attended by about 400 Firestone men. One new feature at this year's convention was the publication by the company of a special newspaper containing the news of the proceedings. This was a paper called "Co-op," in regular newspaper form, two numbers containing four pages each, while a third had eight pages. Another innovation was the taking of motion pictures of the convention, 1,000 feet of film being used in this manner.

Some interesting figures have been compiled by the rim department of this company, from which we learn that in the past year's production of Firestone rims 12,000 tons of steel was used; that 400 mechanics and 16 electric welders are employed in this production, which requires 150,000 square feet of floor space, with 15,500 square feet of storage for the raw steel stock; that 1,000 box cars are utilized in carrying away a season's output of rims, and that from 10,000 to 50,000 rims are always carried in stock at the factory for immediate delivery.

Announcement has been made that the Firestone company will, this winter or in the early spring, build a three-story office and storage building on the site of the present office.

* * *

A letter of recent date addressed by Thomas F. Walsh, president of the Swinehart Tire & Rubber Co., of Akron, to an inquirer regarding the effect of the war on the rubber trade, contains the following interesting paragraphs:

"It is difficult at this time to state definitely just what the

valve to be used in toy balloons which permits of inflating and deflating as frequently as desired. By simply pressing the neck of the balloon the air is released and when retained in normal position the balloon remains inflated indefinitely. Composed of a hard circle of rubber, made cup shape in size to fit the neck of the balloon, with a small loose flap at the base, the whole is so simple that chances for it to become ineffective are reduced to a minimum.

This company advises all car owners who are about to store their cars for the winter to remove all tires from rims not of the quick detachable variety, and after slightly inflating both tire and tube wrap each in cloth and place it in a dry room having a temperature of about 50 degrees, the exclusion of light tending to preserve the life of the tire.

* * *

George S. Andrus is acting general manager of the Superior Tire & Rubber Co., which was lately incorporated under the laws of Ohio, with a capital stock of \$125,000. The company is at the present time having its inner tubes manufactured, but is using its own compounds and has its own sales agency. In the near future it expects to have a plant of its own in Akron, when it will take up other lines of rubber production.

All Southern branches of the Goodyear Tire & Rubber Co. have been instructed to purchase a bale of cotton and to exhibit it in their windows.

About 450 members of the Goodyear sales force have just arrived in town on special trains to attend the three-day convention which commences October 29.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

WHILE the various branches of the rubber manufacturing business differ widely as regards activity, the whole trade may be pronounced nearer normal than many other lines of industry. Crude rubber is being bought, and deliveries on contract are going forward, though the total consumption of crude gum is estimated at less than is usual at this season. The past season has been an excellent one for automobile tires, and while there is a curtailment of production at this time, such is to be expected at the close of the summer season. The unusually pleasant weather has extended pleasure riding much later than usual, with a corresponding wear and tear on tires, which must result in a greater demand, if not this fall certainly next spring, when general re-equipment is due.

The season in New England has made an extensive demand for garden hose, which has in its turn resulted in advance orders for spring deliveries far above the average. Belting and mechanical goods are not in so great demand. The call for druggists' soft goods is somewhat under the average. The clothing men have felt the effects of a tardiness on the part of the weather clerk to furnish the usual September and October rains, but a demand is noted for rubberized cloth for export, presumed to be for making up into ponchos and for covers for use on the European battlefields. The same is true of the rubber footwear business. The makers of this line have been busy right along, and orders which should have come in last spring and summer are now being received. Some factories have been shipping unusual quantities of boots abroad, which are rumored to be for the use of the British army. One company is making arctics on a government contract for the United States army. Several manufacturers of rubber soles report steadily increasing business, showing that rubber is in part relieving the leather scarcity in the shoe business.

[It was "some belt" which was recently shipped by the Boston Belting Co. to the France Stone Co. This was a conveyor belt

CONVEYOR BELT MADE BY BOSTON BELTING CO. AND PRESIDENT THOMAS A. FORSYTH.

such as is used for carrying crushed stone, ore, coal, etc. The belt was 83 feet long, all in one piece. It was 36 inches wide,

and was of 8-ply with extra thick rubber cover. Its size can be appreciated by the picture here shown with President Thomas A. Forsyth standing beside it. The belt weighed 12,000 pounds and its value was more than \$5,500.

* * *

Frederic C. Hood, general manager of the Hood Rubber Co., is one of the many American tourists who were in Europe at the time of the declaration of war. While he belittles his personal experiences, which were not sensational, as were those of less experienced travelers, still he tells an interesting story of his hasty trip across the continent from Italy to Norway and across the mine-infested North Sea to Scotland.

With his wife and son, he was touring the Dolomites in a motor car he hired in Munich when he first heard the rumors of coming war. These did not prevent the party from going to Venice, for three days' sightseeing. As they motored north through Verona in Italy, and Botzen and Landeck in Austria and thence to Munich, they saw a restlessness which foreboded trouble. From Munich they proceeded by rail to Dresden, where on July 31, things looked so serious that Mr. Hood decided to get out of Germany as quickly as possible, so arranged to take the five o'clock train to Berlin. Finding a train an hour earlier, they took passage in that, and arrived at the German capital on nearly schedule time, while the next train did not run for several days.

Berlin was in a fever of excitement. Every German knew where he was to report and what he was to do. The streets of Berlin were filled with soldiers, and with weeping women. Savings banks had hundreds of people in line withdrawing deposits. Taxicabs were breaking the speed laws. There was a great undercurrent of excitement, which the younger men showed by singing and marching and cheering. Tourists were hastening to get through Germany and Holland to England or America. The trains were being reserved for the army. Mr. Hood decided that a northward journey would be more practicable than going west, thinking that the "longest way round was the shortest way through." At the station the broad platforms were piled high with baggage; but a part payment in advance, and the rest when the work was done, enabled him to get his own trunks aboard the train, and the Hood family started for Copenhagen, where they arrived only a few hours late.

In Copenhagen the excitement was intense. Reports were current that the North Sea had been mined, and that the German fleet might soon bombard Copenhagen. Many steamship sailings to England had been abandoned. At the American Consulate hundreds of tourists were clamoring for assistance to get home or to England. Many Americans were booking steerage passages on the Scandinavian Line, but Mr. Hood decided to go to Christiana, Norway. Here he found the Norwegian army was mobilizing and transportation still uncertain.

When he tried to buy railroad tickets, he found he could get no money changed, as all the ticket agencies were out of cash. But a back door of a bank, the correspondent of the American Express Co., whose travelers' checks he had, was finally found, and plenty of money procured after a patient series of calls on the paying tellers. Thursday morning early, they left Christiana for Bergen over the beautiful Scenic Railway of Norway, and on the train he had good luck. A new law was passed that "alien enemies" could not land in England, and there were Germans on the train who had engaged passage to England, and who could not go to England, so Mr. Hood secured their reservation. A sample of the many "extra" expenses may be cited here, as the one-way fare on this boat was \$55, while the regular round-trip fare is \$32. The boat usually sails from Bergen to Hull, England, but on account of the mines the boat went to Leith, the port of Edinburgh, Scotland.

That trip was one of the worst experiences Mr. Hood ever encountered. The sea was rough. There were enough vague

rumors of mines to keep the nerves on edge, and in the middle of the voyage a submarine suddenly appeared near the boat and investigated the nationality of the steamer. The culinary department was in a chaotic state, the regular help having been called to arms, and their places taken by incompetents. Mr. Hood went into the kitchen and obtained food for himself and family.

When the boat arrived at Leith, it was thought their troubles were over. Not so. Orders had come that none but British subjects could land without permission from the Home Secretary's office in London. There were 40 Americans and two Belgians on board, and the boat was to sail on the return trip at midnight. A sentry with fixed bayonet prevented any one leaving the boat. The customs officers could do nothing, and the consular office was of no avail. Then Mr. Hood and others endeavored to induce the Chief of Police to arrest the whole party, and thus save them from deportation; but the police were powerless. Finally, after a delay of over ten hours after arrival at Leith, a telegram came from London and the passengers were allowed to land on British soil late Saturday evening. Mr. Hood went to London by sleeper, arriving there Monday morning, eight days after departure from Berlin. Even at that, he was ahead of some of those who took the "direct" route between the two cities. Not so exciting as some other Americans' experiences, but sufficiently so.

* * *

The Atlantic Rubber Co., now at Hyde Park, has commenced the construction of a factory near Atlantic Station in Quincy. The plans, which are from the office of J. O. De Wolfe & Co., the well known rubber mill architects, call for a three-story brick building of mill construction and so designed that additions can be made, when desired, in conformity with the original style. This company manufactures rubber-coated fabrics for the cutting-up trade, sheeting and molded goods, besides some specialties in the latter line. Mr. Alfred A. MacLaren is treasurer and manager.

* * *

The boot and shoe mill of the Apsley Rubber Co. at Hudson was shut down one week for the purpose of installing heavy electrical machinery. For some time past all the outlying departments of the plant have been operated by electric power. With the completion of this installation the main mill shafts and all power for the boot and shoe departments are run by motors. The entire plant now has electric power. One of the motors just installed is of 500 h. p. and weighs over five tons.

The company will effect important economies in its power department resulting from the present installation, together with increased efficiency and uniformity of speed.

* * *

To meet the growing demand for a substitute for sole leather, the Tyer Rubber Co., of Andover, has been engaged in experimental work for several months past in an effort to produce a vulcanized fibre compound which will fulfil all the requirements of leather. The experimental work has now reached a stage where the company feels justified in offering to the shoe trade a material which is claimed to be fully equal in every respect to sole leather.

This compound can be manufactured by exactly the same methods now employed in connection with sole leather and as its various ingredients can be obtained in unlimited quantities, the price will not be subject to the wide fluctuations often prevailing in the sole leather market.

* * *

It may be remembered that James Brien, proprietor of the Eastern Rubber Co., of this city, was killed in an automobile accident a few months ago. Since that time the business has been continued by the estate of Mr. Brien, until last month, when a corporation was formed under the name of

the Eastern Rubber Co., with an authorized capital stock of \$90,000 in 900 shares of \$100 each. The officers and incorporators are: Christopher Brien, president; Fred C. Miskelly, vice-president; Harriet C. Brien, treasurer, and Jane A. Hay, clerk. The corporation assumes all indebtedness of the business.

* * *

Joseph L. Whiton, salesman for the Congress Shoe and Rubber Co., has become mayor of the neighboring city of Quincy, for the unexpired term of the late Mayor Miller, who died early last month.

THE RUBBER TRADE IN CHICAGO.

By Our Regular Correspondent.

IN some branches the rubber business has improved during the past month; in other respects it is not so good. For the most part the improvement has come in the rubber tire business. This is due to the fact that the weather throughout the Middle West has been ideal for motoring. There have also been half a dozen big races during the month, which aroused great interest and gave an added impetus to the growing sport of motoring. The prize races at Indianapolis, Elgin and Galesburg brought out a large number of cars and served to revive demand in the tire line.

While the automobile tire business has prospered, however, the mechanical rubber goods lines and the rubber boot and clothing lines have not been meeting with such a heavy demand. The reason is not far to seek. Industrial conditions throughout the West and Middle West are far from being as good as they might be. Many factories, owing to the war, are not running full force, while a few of them have closed down. The mines are not working as briskly as usual at this time of the year. This means that the sales of rubber belting and packing have decreased. The rubber clothing business has been a little off owing to the fact that the weather has been too mild to move goods from the shelves of the dealers. As a result the jobbers are marking time and waiting for wet weather to set in.

A. Romain, sales manager of the Quaker City Rubber Co., discussed the situation with his usual optimism, but was frank in admitting that conditions in the mechanical rubber line were a little unfavorable just at present. "But," he added, "I believe that the sunny side for mechanical rubber houses in this city lies in the possibilities of export trade, owing to war conditions. We have recently received some letters of inquiry from large buyers—I will not say from where, but they required translation—and these have served to show us that there is more trade than has been suspected waiting for rubber manufacturers of this country if they care to go beyond the national borders to capture it."

* * *

L. L. Murphy has succeeded W. E. Carver as sales manager of the Rubber Distributing & Manufacturing Co. Mr. Carver is no longer connected with the firm, but will not leave the rubber business, it is understood. In discussing the situation in the rubber boots and clothing line, Mr. Murphy made the following points: "The dealers carried over very few goods through the summer. This is true throughout the Middle West. While things are a little slow right at this time, I expect business to improve with a rush as soon as we have some bad weather. One year ago today we had snow. We have not had any snow thus far this year, and the weather has been clear and mild. With the first rainy spell the stocks of the dealers will be depleted to the extent that they will be forced to place orders at once. Just at present while waiting we are getting ready for the rush that is certain to come."

* * *

J. E. Duffield, manager of the Thermoid Rubber Co., went to Galesburg, Illinois, to attend the auto races recently held in that

city. He had a particular interest in these races, as two of the leading drivers, Bob Burman and Ralph De Palma, used "Nassau" tires on their machines. Mr. De Palma won the race at Indianapolis, which is one of the big sporting events of the West, with these tires, while Bob Burman has used them for two years, winning in many of the events he has entered. Mr. Duffield believes that there is great advertising value in auto races. "Nothing calls the attention of the people to tires like the front page newspaper accounts of auto races," he said, "for it is upon tires that a race largely depends. Without the proper sort of rubber in tires, trouble is certain to come."

L. L. Bucklew, who was recently appointed special representative of the Department of Commerce of the United States Government, was in the city last week talking with a number of the leading rubber men. He leaves in a few days to spend a year or more in the study of commercial conditions in South America. Local rubber men told him, as well as they could, just what it was that they wanted to learn. Upon his return Mr. Bucklew will file his report with the government, and the result of his labors will be made public. Rubber manufacturers here are all the more interested in Mr. Bucklew's mission owing to the fact that an all-water route from Chicago to the Gulf of Mexico will soon be a fact. It requires only the deepening of 60 miles of canal which forms the connecting link between the Chicago river and the head-waters of the Illinois river.

* * *

W. H. Salisbury & Co., Inc., have just entered upon the sixtieth year of their career as rubber merchants in this city. This company has been continuously in business since its establishment in 1855, though many changes have of course occurred in its personnel. A folder recently distributed by the company, calling attention to the various lines of rubber goods—hose and accessories, belting, packing, tiling, drug and hospital supplies, molded goods, etc.—carried in stock, announces that the company is "59 years old and proud of it. Not just proud of years, but of the fact that we have so long enjoyed the confidence of the trade," and states that they propose to round out their sixtieth year with nothing left undone for the good of their customers.

* * *

Ross White, formerly manager of the Goodyear Tire & Rubber Co. branch at Columbus, Ohio, has been transferred to Chicago as manager of the branch in this city; while C. M. McCreery, former Chicago manager, has been promoted to the position of assistant to H. P. Ziegler, manager of the Western district.

* * *

I. W. Penniman has been appointed Western sales manager of the Walpole Tire & Rubber Co., of Walpole, Massachusetts, with headquarters in the Brooks building, this city.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent.

THE tire manufacturing industry on the Pacific Coast is soon to be extended by the addition of another factory competing for the business of this territory. The Halliwell Co., formerly agent for the Knight Tire & Rubber Co., of Canton, Ohio, has decided to go into the manufacturing end of the business, making a line of motor vehicle tires but specializing in sizes for Ford cars. D. W. McElligott, manager of the company in San Francisco, states that it is for the purpose of developing home industry and at the same time keeping a big share of the tire business on this coast that the company has made plans to manufacture Halliwell tires here.

* * *

The Fisk Rubber Co., of Chicopee Falls, Massachusetts, early in October opened its tenth store on the Pacific Coast,

at 725 South C street, Tacoma, Washington. This branch is in charge of C. H. Underberg, who was formerly manager of the San Francisco office.

The year 1915 will probably see a larger number of visitors in the West than ever before and it is the aim of the Fisk company, through its various branches, to be in a position to supply all the requisites of the automobiling tourists as well as information regarding routes, road conditions, etc. The resorts along the San Joaquin & Eastern Railroad to Big Creek, Kings River Canyon and General Grant Park, as well as the north fork of the San Joaquin, are said to be attracting large numbers of motorists, and the views to be seen from the roadways on the sides of the mountains are described as magnificent.

In support of his claim that the automobile is not only an efficient, but an economical means of transportation, Mr. H. B. Pratt, Pacific Coast manager for the Fisk company, cites an instance where a jury in a certain case being tried in Seattle, and a number of witnesses were ordered taken from the court room to inspect a road a mile and a half long not far from the city. The expense of such a trip by hired automobiles would have been \$79.50, but a similar previous trip having been criticised, this one was made by street car, at a cost of \$205.50.

* * *

John S. Weise, for several years manager of the United States Tire Co.'s Los Angeles branch, has been appointed sales manager of the local factory of the Winton Motor Car Co.

* * *

The Jones Auto Supply Co., of Oakland, California, has taken an agency for Republic tires. The products of the Republic Rubber Co. have until now been handled exclusively in this city by the Imperial Garage & Supply Co., but as the interest in motoring increases it becomes necessary also to increase distributing facilities for tires and other accessories.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THERE has been comparatively little change noted in the rubber industry in this state during the past month, the various plants, according to the lines of goods produced, experiencing diversified conditions. There is a very optimistic feeling among the managers of the local plants, however, that there will be a general reawakening of business within a short time that will start up the idle machinery that is to be found in some of the plants. The rubber shoe workers are running full time, with orders ahead, and there has been a slight improvement in the wire departments. The automobile accessory makers are still behind normal, but are looking for an early improvement. The makers of special surgical and druggists' supplies are reported as being very busy, with some orders coming in from abroad that will keep them going for the rest of this year, at least.

* * *

Materially interested in everything that pertains to the settlement of the difficulties of the Walpole Tire and Rubber Co. because of the close affiliation of the affairs of this concern with those of the Atlantic National Bank, of this city, and the Consumers' Rubber Co., of Bristol, the action of the Federal Court, at Boston, on October 19, in again postponing the sale of the Walpole plant, is generally commended.

The matter of fixing the date for the sale of the Walpole company property was put forward, upon the recommendation of the receivers, in concurrence with counsel of the stockholders, to January 4, 1915. Leave was granted to interested parties to bring the matter before the court on ten days' notice. The

hearing was held before Judge Dodge in the United States District Court in Boston.

The receivers stated that the business of the company had continued to be good, both orders and sales, as a whole, being in excess of the corresponding months of last year and that prospects are excellent for a continued good business during the winter months. Permission was granted the receivers, upon their petition, for the payment of a fourth dividend to the creditors, amounting to 10 per cent., for which they have in hand the sum of \$125,000. This makes a total of 22 per cent. that will have been paid in liquidation of the approximately \$1,250,000 claims that have been allowed against the company. Dividends of 4 per cent. each were paid on March 14, June 1 and July 27.

On the subject of a sale of the Walpole property, counsel for the receivers stated that they had consulted numerous financial interests and were told that conditions are not likely to be propitious for selling the property for some months to come.

A new factory building is being erected on land between Brook and Whitehill streets, in Taunton, to be occupied as a new home for the Taunton Rubber Co. The new building will be more than 100 feet long and 50 feet wide, and will also have a large wing, the whole structure being of brick and glass. Facilities will be afforded for more than a hundred operatives, and the capacity will be not less than 24,000 rubber heels a day.

The Hospital Rubber Co., of Attleboro, has been incorporated, with a capital stock of \$100,000, and has removed to larger quarters in the Bushee factory building, where it is occupying the ground floor. The incorporators are George J. Kelley, Mrs. Geraldine S. Kelley and Miss Lydia D. Peck.

The employes of the Revere Rubber Co. have organized a six-team shop bowling league, representing the Accounting, Cost, Thread, Solid Tire, Stock and Shipping departments.

Seven Oaks, the residence of former-Governor Augustus O. Bourn, of the Bourn Rubber Co., at Bristol, was considerably damaged by fire recently. Mr. Bourn was at his office in this city, while Mrs. Bourn, who is an invalid, was in the house, but was assisted to a place of safety, although her nurse was nearly overcome by smoke.

On October 11 about 100 employes of the Davol Rubber Co., of Providence, Rhode Island, with their friends, held an outing at Emery Park, not far from that city. Outdoor sports were a feature of the outing, including a baseball game in which the team composed of married men were victorious over their unmarried rivals. The outing was an all-day affair, and at 12:30 the party was served with chicken chowder, while at 4 o'clock they enjoyed a roast chicken dinner. Musical performances at the Colonial Casino and the Old Tyme Inn were attended by many members of the party.

The factory of the National India Rubber Co. at Bristol, is shipping a large lot of rubber shoes, several carloads leaving the works each day. The wire insulating business of the company is growing better as the fall advances, and already large shipments are being made of this product.

Manager Chris. A. Ostby of the company's baseball team was recently presented with a handsome silver loving cup by the members of the team who played during the season. The names of all the members of the team are engraved on the cup.

A NEW RUBBER GOODS FABRIC.

A new fabric for which superiority is claimed is soon to be employed by the Goodyear Tire & Rubber Co., of Akron, Ohio, in certain of its products. This fabric is the invention of Lawrence A. Subers, of Cleveland, Ohio, and is described as a "laminated cohesive interwoven fabric."

TRADE NOTES FROM TRENTON.

THE Roberts Aeroplane Co., which has been incorporated under the laws of this state, will erect a factory at Blackwood, New Jersey, for the construction of biplanes.

The Reliable Tire & Rubber Co. has been incorporated here to manufacture and deal in automobile tires, tubes and other rubber products. The capital stock of the company is \$24,000, and the incorporators are: Arthur R. Colvin, Erastus L. Irving and Albert Numbers.

The Braender Rubber & Tire Co. is building a four-story fire proof addition to its plant at Rutherford, New Jersey. This addition, which is 129 feet long and 141 feet wide, will be equipped with all the latest machinery adapted to the manufacture of tires and tubes and will increase the capacity of the plant to approximately 1,000 tires and tubes each per day.

October 19 was a date of special rejoicing in the home of J. Cornell Murray, vice president of the Empire Rubber & Tire Co., of this city, the occasion being the birth of a son.

A 2,000-ampere power station is being built in this city by the Wright Electric Co., adjoining the factories of the United & Globe Rubber Cos. and the J. H. Smith Co. Both of these concerns have found night operation of their plants necessary in the production of tires in required quantities, and the erection of this modern electric plant will enable the companies to operate night as well as day shifts besides effecting a considerable saving in power cost.

THE MICHELIN IDEA OF ROUGH TREADS.

The Michelin company has always been a staunch and persistent advocate of the smooth tread. All treads with any sort of pattern this company has always referred to as "sculptured tires," and sculpture on the tread of a tire, it asserts, is

waste, pure and simple. Here is a cartoon recently promulgated by the Michelin company showing the unhappy consumer being squeezed by the "sculptured" treads.

THE MOHAWK RETREAD BAND.

The Mohawk Rubber Co., of Akron, Ohio, is now manufacturing a non-skid retread band. This band is endless and is molded into shape, so that it fits the casing perfectly. It is semi-cured and has a layer of pure gum on the inside, where it comes in contact with the casing, which makes buffing easy and gives the cement the proper hold to prevent separation. In applying the band it is cemented, buffed, wrapped and cured. The tread design is the same as the pattern illustrated on page 316 of THE INDIA RUBBER WORLD for March, 1914.

THE OBITUARY RECORD.

HENRY P. DAY.

THE American rubber industry lost one of its pioneers and veterans in the death of Henry P. Day, which occurred at his home in Seymour, Connecticut, on October 9, in his eighty-sixth year. For nearly sixty years he had been associated with his brother in the manufacture of hard rubber pencils, penholders, fountain and stylographic pens and other specialties. He was one of the first to take up the manufacture of hard rubber and during the greater part of his long life was identified with this industry.

Mr. Day was born in West Springfield, Massachusetts, March 12, 1829, the son of Julian Day and Lois Goodyear, a cousin of Charles Goodyear. He attended the public schools of that place until the age of 14, when he went to Ohio and became associated with an uncle in the manufacture of paper.

When he reached the age of 21 he joined the great gold seeking

caravan and went to California, remaining there for three years. In 1854 he returned to the East and settled down in Seymour and with his two brothers, Austin and Edmond, embarked in the rubber business, their first work being confined chiefly to the cleaning of rubber. But very soon they began the manufacture of hard rubber goods and insulated wire cables. Their business increased to such an extent that about ten years later, in 1866,

HENRY P. DAY.

it was divided, the brother Austin taking over the insulated wire cable manufacture while Henry and Edmond continued the manufacture of hard rubber, under the firm name of H. P. & E. Day. He was active in this industry up to a few days of his death.

He was a man of the highest character and possessed in a marked degree that sterling integrity which New Englanders are always proud to feel is a characteristic of the old native stock. He was greatly beloved by his employees, some of whom had been associated with him for half a century. He was public spirited as a citizen and with his brother Edmond recently donated a free public library to the town of Seymour.

He was married in 1865 to Miss Fannie Gilbert, who, with two sons—Julian Gilbert Day, of Derby, Connecticut, and Henry Goodyear Day, of New Haven—survives him.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in the East desires to be placed in communication with American manufacturers of india rubber tires for carriages. It is stated that if the firm can secure proper connection a considerable amount of business will result. Prices—which should be quoted f. o. b. shipping port, or preferably c. i. f. destination—discounts and terms should be sent, in English, when references will be furnished. Report No. 13,877.

A manufacturers' agent in the United Kingdom wishes to secure agencies for American rubber shoes. English and American references will be furnished. Report No. 13,899.

A highly reputed house in the United Kingdom wishes to secure names and addresses of American makers of zinc oxide, dry white and red leads, being prepared to buy outright c. i. f. destination or to act as buying or selling agents. Report No. 13,922.

A firm in southern Europe wishes to represent an American firm exporting rubber for automobile tires. Report No. 14,055.

A European firm handling paper of all kinds, rubber tubes, sponges and rubber mats, desires to act as agent for American manufacturers. Correspondence may be in Portuguese or French. Report No. 14,033.

A firm in the East Indies desires to place an order for American waterproof canvas. This firm will require a very large quantity of canvas, and prices, etc., and time of delivery of 10,000 yards of each quality desired should be submitted at once. Samples forwarded by the consular officer may be inspected at the Bureau of Foreign and Domestic Commerce, Washington, and at its branch offices. Report No. 14,034.

A foreign consular officer resident in the United States wishes to receive names of American manufacturers of rubber hospital supplies and surgical instruments. Report No. 14,147.

A company in the United Kingdom requires considerable quantities of compressed ebonite for high-tension insulation for magnetos for internal-combustion engines. Report No. 14,149.

An importing firm in the United Kingdom desires to purchase pigments such as white lead, zinc oxide, lithopone, etc. Report No. 14,161.

A company in England wishes to secure agencies for American manufacturers of Chemicals. Report No. 14,162.

A manufacturer and importer of elastic goods in South America desires to secure samples, quotations, etc., regarding thread rubber for weaving elastic goods; twisted and artificial silks and twisted cotton thread for weaving elastic goods; also raw glue and raw dextrine, and catalogs of machinery for this line of manufacture. Correspondence should be in Spanish. Report No. 14,183.

THE MADEIRA-MAMORÉ RAILWAY IN A RECEIVER'S HANDS.

The Madeira-Mamoré Railway whose early history and marked vicissitudes have been set forth in these columns from time to time, was placed in a receiver's hands on October 13 by the Federal Court at Portland, Maine. This was done on the complaint of Deane Mann, of London, England, who owns something over \$100,000 of the company's bonds, the interest of which, according to his claim, due on the first of October, was not paid. The railway company admitted the allegations in the complaint and joined in a petition for the receivership.

The Madeira-Mamoré Railway was organized in Maine in August, 1907, and the controlling company, The Brazilian Railway Co., was organized in the same state about a year earlier. The two companies have outstanding capital of \$63,000,000 and it is said that their indebtedness exceeds \$118,000,000. In a general way, the cause that necessitated the receivership was the prostration of business in the Amazon country and particularly the low price of rubber which made the operation of the Madeira-Mamoré road unprofitable. The immediate cause of the company's trouble was its inability to obtain \$10,000,000 said to be due the Brazilian Railway from the Brazilian Government.

Just how much rubber business this road will have in the future, is problematic, but with the general development of northern Bolivia and particularly with the opening up of its gold fields, it is by no means impossible that this little strip of railroad, hardly more than 200 miles long, which involved such a disproportionate outlay of money, not to mention the sacrifice of human lives, may some day make some adequate return for its great cost.

New Rubber Goods in the Market.

WATERPROOF SPORT AND HUNTING CLOTHES.

THE white rubber raincoat illustrated is made with fan fullness in the back, so that it may be worn in the saddle, for which purpose it is intended, as well as for use of the motorist.

The second illustration shows a hunting suit. This suit, which is made of waterproof Forestry cloth, consists of coat, knickerbockers and a convertible garment which may be used either as a skirt or cape. A hat of the same material completes this very practical outfit.

Sport coats of various other designs are being made in such light weight materials, as rubberized cashmere and rubberized crêpe-de-shine, and of rubberized Mercerized Cantonina.

HOLLOW RUBBER BALLS OF NEW DESIGN.

The rubber ball is no particular novelty. In fact, all the writers on rubber history mention the interesting incident where the Europeans who followed immediately in the wake of Columbus discovered the South American Indians playing with rubber balls. But here are rubber balls of new design. They are all hollow. The first ball,

which is $3\frac{1}{2}$ inches in diameter, may properly be called an alphabet ball, as it has a raised band around the center on which appear all the letters from "A" to "Z." These letters are embossed and colored so as to make them quite conspicuous, the idea evidently being that while the youngster is deriving amusement from playing with the ball he is quite unconsciously absorbing his letters. The raised letter idea is also carried out in the other $3\frac{1}{2}$ -inch ball, on which are molded the words "Merry Christmas."

The smallest of the three balls, which is $2\frac{1}{2}$ inches in diam-

eter, is in its design an imitation of the ordinary baseball so dear to the heart of every American boy.

IMITATION BUTTON SHOE WITH ALL GORE TOP.

The substitution of cloth and other materials for leather in shoe tops is a distinctive feature of this season's sample lines, inspection of which shows several styles in which goring forms the material of substitution. The accompanying illustration shows a novel example of this feature. This is a man's shoe with an all gore top, imitation button, designed to slip on over the foot in regular boot style. In appearance it looks exactly like a cloth top shoe, while having the advantage of a much better fit. [Hub Gore Makers, Boston.]

RUBBER REQUISITES IN THE GENTLE GAME OF FOOTBALL.

Rather strenuous sport is the American game of football. At the close of each season the statisticians compile the number of casualties that have occurred on the different college campuses. These figures are usually rather startling, and they would be much more so if it were not for the various rubber protectors that have been devised to save the players from further maiming. Here are illustrations of two of these protecting devices. One of the accompanying cuts shows the Morrill Nose Mask. This protector is made of the finest quality of rubber, fits over the nose snugly, but leaves a place for ventilation, and is fastened around the head. It saves many a player from going through life with more lumps on his nose than nature originally provided.

The other cut shows a mouthpiece for the football player. This also is made of rubber and has three ventilating holes. It enables the player to come out of a game with all of his teeth, a condition that would hardly be possible without this rubber protector.

A BOXER THAT ALWAYS "COMES BACK."

The illustration shows a boxer that all other boxers must look upon with great envy, for he always comes back, and not only that, but comes back immediately. He may be knocked down repeatedly but he never takes the count. This boxer is known as "Spalding's Fighting Dummy," and from the waist line up he consists of an interior rubber bladder, highly inflated, held in place by a hidden steel frame and covered with heavy brown canvas. The feet are fastened in a heavy T-shaped iron base, which causes the figure to maintain an upright position and to resume it at once on being knocked over. The great advantage of this device is that it enables anybody to do solo boxing, a great convenience on getting up in the morning or going to bed at night, when a human boxing mate may not be available. [A. G. Spalding & Bros., New York.]

ONE WAY TO PRESERVE RUBBER ARTICLES

A correspondent writes to the "Pharmazutische Post" in regard to a method he has discovered for preserving rubber articles. He gives the articles a thin coating of glycerine and then puts them in a tight receptacle in the bottom of which there is kerosene. The rubber articles are put on a rack above the kerosene and are exposed to its vapor. This process, in his experience, gives the rubber a surface which preserves it.

A TOY COAST GUN WITH RUBBER PROJECTILES.

Probably Secretary Bryan would not approve of the toy that is herewith illustrated, for it is a military mechanism of most dangerous aspect. But toy guns have, unfortunately, always seemed to appeal to the masculine young, and are likely to retain a prominent place, particularly in war times, among the articles produced for youthful diversion. This gun, however, is not as formidable as it appears, for the projectiles used are made of rubber and can be hurled promiscuously around the room with perfect safety.

A RUBBERIZED CARTRIDGE BAG.

It is eminently desirable—as already remarked by divers people—that one's powder should be kept dry. Here is a cartridge bag expressly for such a purpose. It is made of waterproof sateen and so contrived that the cartridges once in it cannot be affected either by rain or damp. The bag has a double top, the inner one being soft and pliable and susceptible of being pulled together with a gathering string and tied very tightly. Over this there is a flap that is held down by a buckle on the side of the bag. With this double protection the cartridges are immune from any dampness. The bag is equipped with straps for convenience in carrying. [J. P. Cording & Co., London.]

A MOTORCYCLIST'S RAIN SUIT.

Here is a Scotch idea of a motorcyclist fully protected against the fiercest storm. This suit is made of strong khaki or dark fawn twill of double texture, with rubber proofing. The jacket, which is double-breasted, is long, coming well toward the knees. It has a storm collar and adjustable elastic cuffs. A pair of trousers or overalls of the same material completes the outfit and gives the motorist ample protection under all conditions. [The Scottish India Rubber Co., Ltd., Glasgow.]

A WATERPROOF GOLF CLUB BAG.

Golf clubs may not be seriously damaged by an occasional wetting, but they are certainly not improved by it. The owner of a choice set of clubs naturally prefers to keep them dry. An Edinburgh company has put on the market a golf club carrier which is made of waterproof material, an illustration of which is here given. It will be noticed that the carrier is equipped with a hold fast handle. [William Currie & Co., Edinburgh.]

RUBBER SOLE WITH LEATHER TOE PATCH

The old order has been reversed, and in place of the leather sole with rubber patches or plugs we now have the rubber sole with a leather patch. This new rubber sole extends the entire length of the shoe. The leather patch, which begins at the toe and extends back about 2 inches, running either

straight across the sole or on an oblique line, is flush in thickness with the rest of the sole, the rubber under the leather patch being made considerably thinner than the rest of the sole. The rubber and the leather are joined together on a beveled line. [Flexible Rubber Goods Co., Salisbury, Connecticut.]

RUBBER IN ATHLETIC ACCESSORIES.

One of the newest athletic accessories is a union suit, as shown in the accompanying illustration, the jacket and pants portions of which are joined at the waist by a wide elastic webbing belt. This suit is made of tan army khaki and has the usual knee and hip pads and thigh guards.

A new outdoor basket ball is also now being marketed, the wearing qualities of which are claimed to be superior to any other style yet produced. The new feature of this ball is that the sections of the leather casing are turned outward, making out-seams. The wear on a basket ball being chiefly on the seams—contact with rough surfaces such as cement, cinders, etc., quickly wearing the thread through and causing the seams to rip—an out-seam is supposed, by preventing such wear, to indefinitely prolong the life of the

ball. An inflatable pure gum bladder is supplied with each leather casing, and the ball is laced with a rawhide strip. This new ball has been adopted by many of the playground and outdoor associations throughout the country. [The Draper-Maynard Co., Plymouth, New Hampshire.]

A RUBBER HOCKEY PUCK.

The Spalding "Official" hockey puck here illustrated has been adopted as the official puck of the Canadian Amateur Hockey League, for use in all match games. It is made of rubber, thus eliminating in a measure the possibility of accidents or injury to the players. [A. G. Spalding & Bros., New York.]

KNEE AND ELBOW PADS.

Knee and elbow pads for use in athletic sports are now being made with attached elastic bandages. This is an improvement over the old style for, while the pads afford protection against knocks and hard bumps, the bandages provide support for the knee and elbow and hold the pads in place. The knee pad illustrated is made with leather cover, in roll style, while the elbow pad is made of felt strips—both with elastic bandages at either end.

AIR PUMP CONNECTION RUBBER.

The Romort air pump connections, for use on hand and foot pumps, spark plug and auto tire pumps, will not blow off the tire valve nor turn inside out. They are used in public air stations, garages and vulcanizers wherever air is used. It is all due to the novel design of the little rubber gasket illustrated above. This is the principal feature of the Straight Pump Connection, Automatic Air Valve and the Angle Pump Connection made by the Romort Valve Co., Seattle, Washington.

**PROTECTING THE SINK FROM THE DISH PAN.**

An enterprising manufacturer of tinware has just introduced to the trade a new form of dish pan which should make a strong appeal to the practical housekeeper. This pan is rectangular in shape and so will fit down into the sink. Also, it will be noticed that an outlet is provided in the bottom of the pan—stopped by a rubber plug similar to those used in bath tubs—while a small strainer drawer of rustless galvanized mesh catches any grease or refuse in the water. This drawer slides out and can easily be cleaned. Another feature of the pan is the rubber plugs inserted at the corners to raise it from the bottom of the sink and to prevent scratching of the porcelain. [Ammidon & Co., Baltimore.]

**A HOT-AIR COMB TO DRY THE HAIR.**

Drying the hair deprives a great many women, particularly those addicted to seaside resorts, of many hours of time which might otherwise be turned to some useful purpose. All this tedious drudgery can now be avoided by the use of a simple device, provided there is an electric light attachment conveniently at hand. This device consists of a comb in the back of which there is an electrical heating unit. The teeth are hollow, while at one end of the comb there is a soft rubber bulb, as shown by an outline in the accompanying drawing. When the comb is to be used it is attached to the electric light fixture and the compression of the bulb sends the air over the heated electrical coil down through the teeth of the comb into the hair. This continual supply of heated air naturally greatly expedites the drying process.

**PNEUMATIC STAGE SCENERY.**

Stage scenery which, while being more than ordinarily realistic in appearance, is more easily portable than the old time styles, has been produced, in the form of objects made of air-tight fabric. This scenery may be quickly inflated and when collapsed it occupies very little storage space or may be shipped from one point to another with slight trouble and expense. Trees reproduced in this manner are said to be wonderfully effective, even from a short distance.

FLESH-REDUCING RUBBER GARMENTS.

On page 322 of the March, 1913, number of THE INDIA RUBBER WORLD, mention was made of Medicated Rubber Garments designed and patented by Dr. Jeanne Walter, of New York, for reducing flesh. To her line of union suits, stockings, jackets, wrinkle eradicators and other rubber garments for men and women, Dr. Walter has recently added a bust reducer, made from her reducing rubber, with coutil back.

THE SILENT TIP

This small cut shows a new furniture tip of which rubber is an essential component. This tip consists of three parts—a small crimp or casing, a rubber bumper or cushion and an ordinary screw. The rubber is vulcanized in the metal part with the screw in place, and acts as a silencer, while the smooth surface of the metal glides over the floor without leaving a trail of scratches. [The Silent Tip Specialty Co., 317 Sweetbriar street, Pittsburgh.]

**THE "PARAGON" CHANGING BAG.**

A new style of bag for changing plates or remedying defects in hand camera photography has lately been placed on the market. This bag is confidently recommended by its manufacturers as "a thoroughly well made, practical and durable article." It is made of three thicknesses of proofed woven fabric. As will be seen by the illustration, the sleeves are conveniently located to give perfect freedom to the arms. The eye-piece is fitted with ruby glasses through which the interior of the bag may be seen, while a window of unbreakable material affords safe and sufficient light. [Houghtons Ltd., 88 High Holborn, London, W. C.]

**PNEUMATIC TIRE WITH A CABLE TREAD.**

A tire of unusual construction, known as the Cable Pneumatic, is shown in the accompanying illustration. The tread is made with a thickened portion extending inwardly and having a number of flexible steel cables inlaid in it during its manufacture. These are said not to detract from the resiliency, but to strengthen the tread. They are so placed as to make the tire puncture proof, since they stop any sharp instrument piercing the outer cover. When the inner tube is inflated it has two high shoulders which provide a cushion effect. [C. T. Brown, 258 Broadway, New York City.]

CROSS SECTION OF THE CABLE TIRE.

WIND-SHIELD WEATHERSTRIPS.

To eliminate the possibility of rain coming through the space between the upper and lower halves of automobile windshields, and consequent annoyance, a weatherstrip has been invented, adjustable to all shields regardless of thickness of glass or space between the sections. The strip, which is of rubber and less than an inch in width, is made with a flange on one edge which fits over the lower section of glass and forms a perfectly watertight connection. It is easily adjusted and, although not wide enough to obstruct the vision at any time, may, if desired, be carried under the seat of the car in fine weather.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

New Machines and Appliances.

MACHINE FOR SKIVING INNER TUBE STRIPS.

WHERE the edges of rubber strips for inner tubes are skived by hand great skill is required in order to make the bevel uniform and give it the proper angle to form the best joint. A new machine for doing this work, automatically cutting and beveling several strips at one operation, is illustrated herewith.

The drawings show end and front elevations of the machine.

MACHINE FOR CUTTING AND SKIVING STRIPS FOR INNER TUBES

in which is a table *A* having a roller *B* at the front and another roller *C* at the rear, over which passes an endless belt *D* for supporting and conveying the strip of rubber under the rotating, circular cutters *E*. Each of these cutters is mounted on the lower end of a spindle in the carriage *F*, the upper end of which forms a bearing for a sleeve *G* on the splined shaft *H*.

The lower end of each carriage has a curved presser foot *I* set close to the edge of the cutter. These sleeves and carriages may be moved along the shaft and set to cut strips of any width. The cutter spindles carry bevel gears *J*, which are rotated by bevel gears *K* on the sleeves *G*. The shaft *H* is rotated by gears *L*, and the endless belt *D* is operated by a gear *M* on the shaft of the rear roller *C*. The machine is driven from the belt pulley *N* and is controlled by a clutch *O*.

The sheet of rubber is fed over the belt *D* and is held down on it by the pressure feet *I*. The cutters *E* rotate at high speed and cut the sheet into strips of the proper width and with a bevel of uniform angle. While only two cutters are shown, others may be added, according to the width of the belt *D* and the number of strips to be cut. [U. S. Patent 1,111,170, Sept. 22, 1914. E. Nall and W. C. Tyler, assignors to the Goodyear Tire & Rubber Co., Akron, Ohio.]

Werner & Pfleiderer Co., the well known makers of machinery for the rubber trade, are increasing their manufacturing facilities by the addition of an up-to-date foundry extension at their factory at Sarnaw, Michigan.

PORTABLE BUFFER FOR TIRES.

IN making tires with a fabric breaker strip between the layers of rubber in the tread, the under layer is usually roughened by hand with a coarse rasp to provide a better adhering surface. The accompanying drawings show two views of a portable buffer designed to do this work more quickly and effectively. The machine is mounted on a truck *A* supported at one end by wheels *B* and at the other by legs *C*. On the truck is a motor *D* whose shaft carries a pinion *E* driving a gear *F*.

The shaft of this gear is journaled in a pedestal *G* having a swivel plate *H* at its upper end. Above this is a similar plate *I* with a yoke *J*, forming bearings for a shaft which carries a sprocket *K*. This is driven through a set of miter gears from the spur gear *F*. A collar *L* on the shaft carries an arm *M* having a yoke *N* at the top. In this yoke is journaled a concave buffing roller *O* driven by a chain *P* passing over sprockets *Q* and *K*. The buffer is held against the tire *R* by a spring *S*. The yoke *N* has two handles *T* by which the arm *M* may be turned on its swivel to move the buffer from side to side over the tire, while the latter, mounted on the spider *U*, is revolving. The handles may also be used to increase the pressure of the buffer against the tire. [U. S. Patent 1,112,865, Oct. 6,

1914. W. C. Stevens, assignor to the Firestone Tire & Rubber Co., Akron, Ohio.]

THE STEVENS PORTABLE TIRE BUFFER.

The Williams Foundry & Machine Co., of Akron, has recently received instructions from the Ford Motor Co., of Detroit, to duplicate the order previously given for fourteen Williams vulcanizing plants for as many of the Ford distributing agencies.

MACHINE FOR FOLDING EDGES OF SHEETS.

THE illustrations herewith show an end elevation and a plan of a machine for folding back the narrow strips of rubber which sometimes project beyond the edges of coated fabrics. This work has heretofore been done by hand and as the rubber is unvulcanized and of sticky character, the problem has presented some difficulties.

The machine has a bed plate *A* carrying at the front a roller *B*, over which the coated fabric *C* is moved by hand. As the fabric moves along in the direction of the arrow *X* in the plan view,

MACHINE FOR FOLDING EDGE OF RUBBER SHEETS.

the projecting edge of rubber is thrown up and back by the rapidly revolving belt driven disc *D* having a smooth edge. The folded strip of rubber then passes under a hammer *E*, which is pivoted at *F* and operated by an eccentric *G* through a connecting rod *H*, the eccentric being mounted on a ball bearing on a shaft *I* rotated by a belt pulley *J*. The hammer delivers light but rapid blows and presses the rubber strip down firmly and smoothly on the fabric. [U. S. Pat. 1,111,232, September 22, 1914. J. E. Perrault, assignor to Hood Rubber Co., Watertown, Massachusetts.]

OTHER MACHINES OF THE MONTH.

IN addition to the machinery described in some detail and illustrated above, several other appliances for use in the manufacture of rubber goods have appeared during the past month, descriptions of which, without illustration, follow.

FEEDING FABRICS TO SPREADERS.

This is a device for quickly and smoothly attaching the leader strip or apron to the fabric, eliminating the loss of time required where the ends of the two pieces are sewed together, and doing away with the wrinkles caused by the stitches. The device is a narrow metal plate as long as the width of the apron, with its front and rear edges bent over to form hooks. The rear end of the apron and the front end of the fabric are each wrapped around a narrow clamping strip, and these are slipped under the hooks on the plate. The spreading knife is then raised to allow the plate to pass under and the spreading is begun directly at the end of the fabric, so that there is no waste. [U. S. Pat. 1,110,633, September 15, 1914. C. J. Landin, assignor to Clifton Manufacturing Co., Boston, Massachusetts.]

SHOE SOLE VULCANIZER.

This is a vulcanizer for applying rubber soles to leather shoes. Unlike the ordinary dug-out or sunken mold, it consists of a base plate, engraved to form the bottom of the sole,

with adjustable and detachable walls for forming the edges. These side walls are moved in or out by set screws, so that several widths of sole may be formed for each length of shoe. By detaching the walls, others may be substituted to vulcanize soles of different thicknesses. [U. S. Pat. 1,111,436, September 22, 1914. George F. Butterfield, Cambridge, Massachusetts.]

WIRE SPIRALS FOR TIRE TREADS.

An apparatus has been devised for winding wire spirals and filling them with rubber compound for incorporation in the treads of tire casings. As the spiral is wound it is run through a tube into which the compound is forced by a feed screw. This forms a composite rubber-wire cylinder, which is cut into proper lengths and laid in the tread as the latter is built up. In the completed tire there are four of these wire spirals running longitudinally around the tread just under the surface of the rubber. [U. S. Pat. 1,111,418, September 22, 1914. F. L. O. Wadsworth, Sewickley, Pennsylvania.]

CLICKING MACHINE FOR CUTTING UPPERS.

Ordinarily, clicking presses for cutting out shoe uppers cannot be made to operate over wide stock without having the machine too large and cumbersome or making the cutting block movable. To obviate these difficulties an attachment has been designed by which, after the whole area of the cutting block has been cut over, the stock is shifted to the opposite end of a pair of supporting rails, bringing the uncut stock within the range of the cutter. [U. S. Pat. 1,113,326, September 29, 1914. C. H. Koper, assignor to Hood Rubber Co., Watertown, Massachusetts.]

BRAIDING MACHINE FOR TIRES

A machine has been patented for braiding tire carcasses in annular form, in which a braiding mechanism of ordinary construction revolves horizontally around the tire core, the latter being revolved vertically between guide rollers. When a layer of the fabric is braided entirely around the core, it is covered with a thin layer of rubber compound and a second layer of fabric is braided into it. This is repeated until the carcass is of the desired thickness, when it is slit along the inner diameter and the edges bound to prevent unraveling or turned back to form the bead. This serves as the body of the tire upon which the tread may be built in the usual way. [British Pat. 7,226 (1914). W. H. Dunkerley and T. J. Arnold, Paterson, New Jersey.]

APPARATUS FOR MAKING BULBS.

This comprises two separate devices, the first for forming the bulb with one end closed and the other open in cylindrical form; the second device is for closing and finishing the bulb. The first of these has four hydraulic cylinders; two for closing the mold, one for operating the mandrel, and one for forcing the compound into the mold. After removal from the mold, the open end of the bulb is closed by placing it over another mandrel of elliptical shape, and expanding a strong rubber ring over it. As the mandrel is slowly withdrawn by a feed screw, the rubber ring contracts around the open end of the bulb and closes it. The surplus rubber is cut from the end of the bulb, which is then vulcanized. [British Pat. 7,299 (1914). Rudolf Daeschner, Pasing, near München, Germany.]

VULCANIZING RUBBER BY ELECTRICITY.

RAYMOND B. PRICE, whose name is well known in the reclaiming industry, has been granted U. S. Pat. No. 1,081,330 for a process of vulcanizing rubber in which electricity is used for developing the necessary heat, the process being specially adapted for vulcanizing such articles as belting.

The illustration shows the method used. This is a circular vulcanizer with a square bar in the center acting as a mandrel. Around this is wound the belt to be vulcanized together with a metallic strip which carries the current. Thus when the belt is wound up each side is in contact with the heating strip. The current is

ELECTRICAL VULCANIZER.

turned on through the metallic strip and it is gradually heated by the resistance.

In one experiment described an electrical current of 639 amperes and 1.13 volts was passed through the metal strip for a period of 32 minutes. At the end of that time the strip was uncoiled and the belt was found to be perfectly vulcanized. The temperature rose during the vulcanization to 300 degrees F., the belt being covered with asbestos so as to give a heat insulation. The material vulcanized was a sheet of rubber packing of cheap stock, seven inches wide and 1/16 inch thick.

The claims are for the apparatus comprising the mandrel and strip of metal adapted to be coiled around the mandrel with rubber intermediate between the coils, electrical connections and a casing to retain heat.

It appears also that Mr. Price has been devoting some attention to the vulcanization of such articles as boots and shoes which are usually cured in ovens. British patent No. 10,695 of August 26, 1914, has been granted to him for a process of vulcanizing in which the article to be vulcanized—for example a boot—is placed over a perforated last or tree which in turn is connected with an air pump or some other arrangement for producing a vacuum.

In the cut the boot is shown on the hollow and perforated last, and sealed by the wire 17 at the top. The vacuum pipe 12 serves to remove the air from the last, thus pressing the boot close to it. The effect may be heightened by putting on a pressure of air or steam through the pipes 6 and 7.

The special idea is to remove any air which may be entrapped between the fabric and rubber layers before vulcanization.

A FOOTWEAR REPAIR VULCANIZER.

THIS novel machine is constructed on the principles of the well-known tire repair vulcanizers, and is used for rubber boots and shoes. It has four tubular legs which support the steam table A, the six shoe mandrels B and the two boot mandrels C. These parts are all chambered for steam which is generated by the gas-heated boiler D. The screw clamps E hold the shoes in place while being re-heeled. If a patch is to be applied, the shoe

is placed on one of the mandrels, F, where it is held by the heel clamp, G. The patch is held in place by the presser band H and the stretcher lever I. Boots and shoes are re-soled by the sole plate J and the holding clamps I. Boots are repaired on the mandrels C and the patch is held in place by the presser band K, which is tightened by a lever L. The machine has a steam gage, water glass and safety valve. The preparation of the repair and the subsequent vulcanization is very similar to that of the tire shoe repair. [Smith & Arthur, Ashtabula, Ohio.]

FEDERATED MALAY STATES EXPORT DUTY ON RUBBER.

It is reported that the government of the Federated Malay States proposes to arrange the export duty on rubber in such a way that when the London price falls below 1s. 6d. per pound, no duty will be charged. When the price attains 2s. the present rate of 2½ per cent. would be levied.

ONE FOR THE POET.

The poet sat in the front seat as the car sped over the highway at a forty-mile clip. His hair streamed behind him as though striving to reach his hat, long since flown, but he was happy, and his soul surged with poetry.

"Where are the Ships of Tyre?" he quoted, ecstatically.

There came a sudden report from the off hind wheel.

"Punctured, b'gosh!" replied the chauffeur.—*Harper's Weekly*.

Trans-Atlantic Notes.

[The Rubber Industry's Remarkable Immunity from War Influences.]

WHEN the war broke out the rubber plantation industry of the Middle East was faced with a very difficult situation. Shipping and finance were the chief problems. It was impossible for a time to remit funds for the upkeep of estates, whilst the raising of freights and insurance risks emphasized the trouble. These difficulties were, however, soon overcome. In the Malay States the Government promptly broached a scheme for financing estates temporarily embarrassed, offering to advance 30 cents (Straits currency, equal to 16.8 cents in United States currency; 100 cents = 2s. 4d.) per pound against rubber crops and, in the case of estates not yet producing, to furnish loans on the security of title deeds. As regards shipping facilities, too, insurance rates quickly fell away as soon as practical British control of the trade route became apparent, so that in a comparatively short time practically normal conditions were resumed in the plantation industry. Supplies have been coming forward much as before, and the price of the product has continued to maintain a steady level. A number of British merchantmen have been sunk by the Germans in Eastern waters, but although something like seven million pounds of tea have gone to the bottom, no ships containing rubber in that region have yet been attacked. In the North Sea, however, one steamer conveying something like two hundred tons of rubber to Russia was mined and sunk, but that is the sum total of the commodity lost up to the middle of October. Considering Russia's pre-occupation with war that country maintained its import of rubber during September far better than other Continental countries. But all shipments have to be sent via Archangel, and as this port will shortly be closed by the ice, Russia will presumably be unable to obtain further supplies for some considerable time.

STATISTICAL POSITION IN RUBBER.

In view of the chaotic state of affairs now ruling in commercial and industrial circles, the Board of Trade figures, showing the movement of rubber to and from the United Kingdom during the month of September, are of exceptional interest. They indicate that the rubber industry has suffered far less than most through the outbreak of war. As Germany is now entirely cut off, the exports for the month naturally show a shrinkage, but, as the United States took more than usual, the total reduction is less than might have been expected. Following are the comparative exports from England for the month of September and for the nine months:

	Month ended September 30,		
	1912.	1913.	1914.
To Russia....centals of 100 lbs.	5,430	5,738	3,329
To Germany	16,028	14,078
To France	18,978	7,857	1,053
To United States	25,991	35,375	51,303
Other countries	9,147	9,845	6,280
Totals	75,574	72,893	61,965

	Nine months ended Sept. 30,		
	1912.	1913.	1914.
To Russia....centals of 100 lbs.	56,383	106,644	96,309
To Germany	143,849	171,579	158,428
To France	88,214	79,325	98,304
To United States	237,881	286,670	386,576
Other countries	68,649	93,698	96,087
Totals	594,976	737,916	835,704

A heavy decline is shown in the quantity taken by France, and the export to other countries has fallen by one-third. As Belgium and Austria, both at war, are included under this head, the falling off might well have been greater.

Although the imports of rubber into the United Kingdom during September do not show anything sensational, a very pronounced shrinkage of all wild rubbers is to be noted. Whether this is entirely due to decreased production in the centers of supply is open to question, but in Africa, if not in South America, it is certain that production has been greatly curtailed. Following are the comparative import figures for September, also in centals of one hundred pounds:

	Month ended September 30,		
	1912.	1913.	1914.
From French West Africa.....	1,699	1,047	108
From Peru	3,203	2,555	277
From Brazil	22,747	14,444	11,484
From Gold Coast	606	427	169
From Straits Settlements	20,217	35,360	37,304
From Federated Malay States..	13,051	22,719	15,734
From Ceylon	9,025	15,619	24,877
From other countries	25,359	38,832	22,360
Totals	95,907	131,003	112,313

RUBBER DECLARED CONTRABAND.

At the beginning of September it became evident in London that Germany was endeavoring to obtain fresh supplies of rubber from England through Holland. Telegraphic orders were received from Amsterdam, but signed by well-known German manufacturers. At that time there was nothing to prevent the despatch of rubber to Holland, but rather than supply the enemy and contrary to their own interests, importers laid the facts before the Government, with the result that rubber was promptly declared conditional contraband. What effect this will have upon statistics remains to be seen. For the time being the consumption of rubber must depend mainly upon the demand in this country and in the United States and Canada.

THE TRADE WAR.

As your readers are doubtless aware, war to the knife is being waged in England against German trade. The Press is not merely hunting up German firms established here, but is searching the lists of shareholders of all companies filed at Somerset House to find the extent to which German capital is employed in various undertakings in England. The campaign is a very bitter one, the significance of which may not be fully appreciated in a neutral country. But it is realized here that such economic pressure as we may bring to bear upon Germany will possibly be a more potent factor in terminating the war than the military operations of the Allies in the field.

As a result of the war on German trade many Teutonic firms have been unostentatiously changing their names. It is said that as many as five hundred such changes have been made since August 1. This loophole has, however, just been effectually closed by an order in council, forbidding an alien enemy to trade under any name other than that used when the war commenced. As the order is made retrospective, the position of the five hundred is scarcely an enviable one.

The Dunlop Rubber Co., Ltd., of Birmingham, has been appointed by Royal Warrant manufacturer of motor car tires to His Majesty, The King of Spain.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

GENERAL SITUATION ARMY AND NAVY REQUIREMENTS.

THIS has changed but slightly since I posted my last correspondence. Among additions to goods classified under conditional contraband of war is raw rubber, which, as before intimated, has been going to the enemy through the neutral country of Holland. Many of the rubber works are still exceedingly busy on army and navy orders and as early delivery is important small works which do not in normal times share in this business have come in for a share. Hundreds of thousands of ground sheets have been called for and these have been made both by the regular contractors to the War Office and also, more or less on "spec," by others who have sold them to agents. With regard to the regular contracts the inspection of the goods by the authorities is reported to be as close as ever, but so great has been the demand in connection with the new volunteer army that the ground sheets made by non-contractors, and not necessarily of the standard pattern, have found a ready sale.

The official ground sheet, I may say, has undergone some change in recent years. Formerly it consisted of a grey wigan double texture; that is the rubber was not visible. The modern form, however, is of khaki colored cloth, costing somewhere about 10 pence per square yard, and is double texture single face; that is one side is rubber surface. Every sheet, which is of rectangular form, has 36 holes near the edges. These holes are more numerous than formerly and seem to be largely in excess of requirements, as when in use very few holes are used. Their purpose, of course, is to afford facilities for lacing the sheets to the tent pegs, though it may be added that in many cases no lacing is used at all, the sheet being merely laid upon the ground to afford a waterproof base for the bed. A good deal of this khaki cloth is given out to the rubber works in the roll to be proofed. It is then made up in outside factories into knapsacks and various other articles of the soldier's kit. The cloth used for this purpose is often of a lower quality and sold at a correspondingly lower price than that for ground sheets, which, as I have already said, is 10 pence per yard for the ordinary quality, though business has been done lately at 9 pence. As there are only three firms who carry on the dyeing of khaki cloth it need hardly be said that they are working overtime.

The depression in the proofing and garment branch which has been so pronounced is now much lessened owing to large orders for mackintoshes from the War Office, both single and double textures being called for. This is an important matter for many works, especially in the Manchester district.

Leaving the army for the navy, the mechanical rubber works have a good deal on hand in connection with admiralty orders, normal requirements being largely exceeded owing to pressure of work in government and private dockyards. The most important article as regards bulk is the compound vulcanized sheet rubber, made in three qualities from specified amounts of rubber, zinc oxide and sulphur. Owing to the close competition the margin of profit on this work is by no means excessive and there is the ever-present risk of rejection should the strict letter of the specification not have been complied with. For these reasons one or two of our largest firms have held aloof from such contracts in the past. Among other goods may be mentioned gun tubes, which are 15 inches to 18 inches long, with a two-inch hole, also shaped washers with lugs for guns and plain washers perforated for both holes. Of these there are about a dozen varieties which have to be made exactly to the templates supplied. I note, according to THE INDIA RUBBER WORLD of May 1, that some revisions have been made in the United States Navy specifications owing to representations made by manufacturers,

but that the chemical tests still remain. No alterations have been made in England for many years and the chemical tests still hold good, though as no definite procedure in regard thereto has been agreed upon by buyer and seller, disagreements in results are not unknown.

RUBBER GOODS FROM THE CONTINENT.

The dislocation of the shipping trade during the initial stages of the war has largely been rectified and goods, such as Michelin tires, are again easily procurable. Russian imports, however, are still obtainable only with difficulty, while trading with the enemy is, of course, quite at a standstill. Many rubber goods appear in the category of luxuries rather than necessities, and if they become unobtainable no suffering need arise. Such an article which comes to mind is the rubber sponge, which has achieved a considerable degree of popularity in Great Britain and is one of the very few rubber goods for which we are dependent upon foreign countries. The Russian-American Rubber Co., of Petrograd, was the original maker and doubtless is still the largest producer of the best article. Despite numerous attempts to solve the mystery of manufacture, no British rubber firm has yet succeeded in making a colorable imitation of the Russian sponge, the main difficulty being the particular volatile constituent which causes the intumescence, ammonium carbonate not being satisfactory for the purpose. Others, however, have been more successful than ourselves, and sponges are now being made by one works in America and by the Hannover Gummi Kamm Co. and by another concern in Germany.

During the last decade the few British firms specializing in surgical rubber goods have had to meet a good deal of competition from abroad. Complaints as to quality have been by no means uncommon, but the purchasers have had the remedy in their own hands by buying the higher priced British goods. At the moment, of course, they are compelled to do this. As regards vulcanite, which has always come largely from the Continent, considerable progress has been made of late years in the home production of many classes of vulcanite goods, and naturally the present state of affairs has given a great fillip to this branch. It remains, however, to be seen whether the present advantage will be fully retained in the future, as the conditions for polishing goods in the workmen's homes do not obtain here as in Germany.

THE RUBBER CHEMICAL MARKET

I have read with interest the paragraph in the September issue of THE INDIA RUBBER WORLD dealing with the rubber chemical position in America. With regard to oxide of zinc, I note that America imports a good deal from Belgium. In some recent correspondence I referred to the probability of American zinc oxide coming to England. I find, however, that this has already been the case for some years, owing to an advantage in price. It is a fact that the American product is not considered quite equal to the Belgian—more commonly known in the trade as French—and it is not used for the very best work. The defect appears to be a trace of lead, which leaves black spots after vulcanization. The Belgian zinc oxide is prepared by burning the metallic zinc and is quite free from lead compounds. Presumably the position is the same in America, the Belgian oxide being imported for the best work. Whiting and chalk, in the article under notice, appear to be somewhat mixed. If the chalk referred to is produced in England it must be whiting, which is put under a separate heading. In the British rubber trade chalk always means "French chalk," silicate of magnesia, which comes mostly from Italy, while the real chalk, carbonate

of lime, is always referred to as whiting. One of the largest exporters of the latter, by the way, though a British firm, has its works situated on the French coast. It is stated that most of the magnesia used in the United States is imported from the neighborhood of the Balkans. The actual locale is the island of Euboea in Greece, but what is exported from there is the hard magnesite rock, which has to be converted into the light powdery hydrated carbonate of magnesia before it can be used in rubber manufacture. Presumably this is done in American chemical works. In British manufacture, although the Grecian magnesite is used to some extent, the more common raw material is the dolomite limestone, which occurs in bulk in certain districts and is a double carbonate of lime and magnesia.

Referring to Britain, there is a brisk demand for rubber chemicals, while prices generally are now much what they were before the war, the shortage of sulphur which was acute for a time having now been rectified.

PAVEA RUBBER.

What news there is about this so-called synthetic rubber is entirely of a negative character, and it certainly looks as if the bubble had burst. It is hinted in more than one quarter that people prominently connected with the project are not altogether surprised at the condition of affairs, but I feel certain that there are others who supported the project financially who are now much upset at the turn of events. As nothing is now being done at the large building rented at Handforth, it was proposed to utilize it as a barracks for a battalion of the newly formed Manchester City Regiment, but it has been taken over by the War Office as a camp for German military prisoners.

WILLESDEN CLOTH.

This material is now in large demand for officers camp equipment, portions of bedding, buckets, bath, etc., being made of it. No rubber enters into its composition, which consists of a stout cotton twill rendered waterproof by an organic salt of copper. It has long been used by the Post Office Department for mail bags and is always recognizable by its bright green color. I understand that the patent has now run out so that there is no monopoly in the manufacture.

DR. CARL W. THIEL.

Dr. Carl W. Thiel, who returned from Germany to Messrs. Reddaway's works at Manchester on an agreement for a term of years, went back to Hamburg at the close of the period.

RUBBER FLOORING.

The rubber flooring laid in the Stephen Ward of Guy's Hospital, London, by the Rubber Growers' Association, was presented to the hospital on October 6 by Lady French, wife of the Field Marshal at the moment so much in the limelight. Numerous invitations to the ceremony and afternoon tea were issued to rubber men and others by the president and governors of the hospital. The flooring was made and laid by the Leyland & Birmingham Rubber Co., Ltd. Mr. McEwan, chairman of the Rubber Growers' Association, in the course of a speech, said that about 170 rubber companies had contributed, also stating the association had presented 1,000 hot water bottles made of plantation rubber to the British Red Cross Society.

SILVERTOWN RUBBER WORKS EMPLOYEES AID THE ALLIES.

Voluntary subscriptions by employees of the Silvertown works of the India Rubber, Gutta Percha & Telegraph Works Co., Ltd., to a war relief fund of their own organization amounted in four weeks to £100, half of which sum was donated to the National or Prince of Wales Fund and the remaining half divided equally between the British Red Cross Society and the Belgian Relief Fund. The intention is to send similar sums, at least, to each

fund every four weeks as long as may be necessary. Since the commencement of the war about one-fifth of the male employees of the company of suitable age have left for military service.

BRITISH TRADE NEWS NOTES.

THE North British Rubber Co., Ltd., whose plant at Castle Mills, Edinburgh, is said to be the largest rubber manufacturing plant in the British Empire, is paying half wages to all married employees engaged in active war service, and to those of the unmarried men similarly engaged who have relatives dependent upon them. In addition, positions will be kept open for these employees until the close of the war.

A. Schrader's Son, Inc., of Brooklyn, engaged in the manufacture of tire valves and tire pressure gages, has opened a factory branch in London, at 14-16 Dorset place, following out arrangements made before war broke out. This branch, in charge of W. H. Cole, is expected to be in operation during the present month.

Forty-five members of the office and works staff of Messrs. David Bridge & Co., Ltd., rubber machinists, Castleton, Manchester, have joined the British colors. Weekly allowances are being made to those dependent on them.

Two of the plans for the introduction of rubber tiling in London for use as hospital flooring have been carried into effect. In both cases the plantation rubber used was donated by the Rubber Growers' Association. Stephen Ward at Guy's Hospital has been paved with rubber tiling manufactured by the Leyland & Birmingham Rubber Co., Ltd., while a second gift of flooring has been made to the Children's Hospital, Great Ormond street, London.

St. Michael's Church, Cornhill, London, has been paved with rubber tiling, which is said to have much improved the acoustic properties of the edifice.

Complaints are heard from England that the sporting goods trade is in a condition of unprecedented depression as a result of the number of customers drafted for combative purposes. Reduction of staff or suspension of production has been threatening the activity of large concerns. Men of advanced years now form the bulk of those still adhering to golf and other outdoor sports.

The contractors supplying the Birmingham Corporation have been notified that all German and Austrian goods will in future be strictly excluded from the supplies to be furnished to that body. Rubber articles for surface cars, ebonite and vulcanite for electrical purposes, asbestos and other insulating substances are among the goods thus affected, as well as a large quantity of mechanical fittings. As to rubber erasers and elastic bands, British manufacturers have for some time past taken this business from their Austrian rivals, while in the latter article there has been keen competition from America. This municipal business in the various sections of the rubber industry is of importance and merits the attention of American manufacturers.

The Avon India Rubber Co., Ltd., of Melksham, Wiltshire, is contributing toward the Prince of Wales Relief Fund 2s. for every dozen Avon golf balls sold, a sum which is said to practically absorb the profit on the sale. About 20 per cent. of the employees of this company joined the colors within a month of the declaration of war.

About 200 employees of Messrs. Charles Macintosh & Co., Limited, Manchester, have joined the ranks of the British army, relief being given their dependents by the company. Some sixty Wood-Milne hands have offered their services, special allowances being made their families, in addition to the contributions of the concern's workmen who are still employed.

International Rubber Conference.

Predominance of Papers by Rubber Chemists.

IN examining the papers read at the recent International Congress held in conjunction with this year's Rubber Exhibition in London, one is struck by the great change that has taken place since the previous Congress in the subjects chosen for discussion. Whereas, three years ago, the papers nearly all dealt with rubber in one or other of its botanical aspects, on the present occasion the chemist and the manufacturer practically monopolized the stage. The great majority of the papers were intensely technical, whilst the various debatable points were almost exclusively thrashed out by rubber chemists. In illustration of this it may be mentioned that while de Wildeman's contribution on "The Cultivation of the Rubber Vine in Central Africa" seemed to arouse hardly a vestige of interest, Helbronner's paper on "The Vulcanization of Rubber by Ultra-Violet Rays" and Schidrowitz's discourse on "Variability" met with receptions indicative of the most acute interest.

This change of ground from the field of cultivation to the realm of the chemist was duly noted by the chairman, Dr. Torrey. His remarks in this connection are worth recording. "The first paper at the last Congress," he said, "was one which led to the most active and spirited discussion I have ever heard on any paper, and at the end of the time the entire conference practically demanded that there should be more time given for the discussion. The result was that on the next day an extra two hours had to be assigned to it. And what do you suppose the subject was? Well, it was 'The Forest Growth of *Funtumia Elastica*.' If the first paper at this Congress had opened on that subject it would have cleared the room in twenty minutes. That was three years ago and I mention the incident just to show how things have moved on."

HEVEA WITHOUT A RIVAL.

Much has been learned in the meantime as to the capacity and economic value of the various latex yielding trees. In point of fact it may be said that so far as the planter is concerned, a process of elimination has been going on which has left *Hevea Brasiliensis* without a rival in the estimation of the rubber grower of the Orient. The planter of the Middle East is generally familiar with *Castilloa*, *Ceara* and *Ficus*, and after much experimenting he has discarded them all in turn as unworthy to hold a candle to *Hevea* as a plantation tree. In Java and Sumatra, some years ago, the Dutch laid out many hundreds of acres with Rambong. These trees are now being steadily cut out to give place to *Hevea* and, in some cases, *Ficus* trees have been felled by the hundred to make way for the more reliable and better yielding native of Brazil.

As to the value and treatment of various species growing wild in the African forest, with the fall in prices and the rise of the plantation industry, growers and consumers have lost all interest. Hence the papers at this conference dealt almost exclusively either with the treatment of *Hevea*, the treatment of the product, or the behavior of the same when subjected to various chemical processes.

OLD PROBLEM REVIEWED

To the non-scientific, or rather to the practical, mind, one of the most interesting papers was that by A. Irving on "A Comparison of Wild and Plantation Rubber." The author, in addition to being a planter of some experience in both Ceylon and Malaya, was recently commissioned by the Brazilian Government to visit the Amazon Valley, with a view to introducing better methods of production and to advise as to the establishment

of a plantation industry in that region. One or two points in his discourse may be referred to. The fact, for example, that trees in the Amazon are generally at least thirty years old before they can be profitably tapped—comparing with four years in the case of plantation trees—may have considerable bearing upon the relative quality of the rubber produced. Mr. Irving also remarked that he had often been asked what reserves of rubber trees there were in the Amazon Basin. His reply was that there were many millions of unworked trees in the country, but their inaccessibility rendered them an unrealizable asset with rubber at its present price.

The discussion that ensued was a very interesting one, for it revolved round the question as to whether the Eastern plantations are in reality operating with the best variety of *Hevea*. The late Dr. Huber, who made a wide tour of the plantation zone, is generally credited with the definite statement that it is the true *Hevea* that has been planted in the Orient. Mr. Irving stated, however, that he had seen as many as six different varieties growing together in Brazil and was informed by all with whom he came in contact that Wickham had not succeeded in getting the best variety of rubber seed, namely, that of the Black *Hevea*. Wickham holds a contrary view and has asserted it with ample testimony on more than one occasion. Dr. Werner Esch, who was prominent in most of the discussions, said that he had heard Dr. Huber himself state that the variety of *Hevea* found on Mid-Eastern estates was other than that recognized as the best in the Amazon Valley. He disputed the general interpretation given to Huber's words and reiterated the statement that this authority had personally told him the plantations have not got the same tree. The mystery thus becomes deeper than ever. It is, however, one that is scarcely likely to perturb the plantation industry.

PREFERENCE FOR UNSMOKED RUBBER.

Another practical paper was on the "Advantages and Defects of Plantation Rubber," by Mr. W. A. Williams, the general works superintendent of the North British Rubber Co., Ltd. He contended that the introduction of plantation rubber had been the means of displacing "mediums" to a very great extent, simply because its use in the factory had given less trouble in manufacturing operations and better results with an attendant reduction in the manufacturing cost. As a displacer of mediums, he said, plantation rubber had made a bold bid for the market and had been successful. In other respects Mr. Williams gave expression to views which are certainly unorthodox, albeit the more interesting on that account. After repeated trials he had found that unsmoked biscuits and sheet gave the best all-round results, and were to be recommended for the reasons that for strength and uniformity they were quite as good as smoked sheet and were undoubtedly superior to creped or blocked rubber. With creped rubber he was afraid the planters had sacrificed everything to appearance, the one object apparently being the turning out of a nicely finished, attractive looking product. Creping and grinding of the rubber should, in his opinion, be left entirely to the factory side and it should be the aim of planters to turn out their rubber as strong as they possibly could. In conclusion, he put in a plea for a closer working relationship between producers and consumers.

This paper gave rise to very little discussion. Here it may be observed that very few manufacturers supported the conference, presumably on the ground that such experience as

they have gained by much observation and experiment is their own peculiar property. Nevertheless, an expression of views on broad lines, such as in the foregoing paper, could hardly be detrimental to any individual interest and might conceivably be helpful to the industry as a whole.

VULCANIZATION BY ULTRA-VIOLET RAYS.

Probably the most controversial papers were those read by Bernstein and Helbronner on "The Study of Rubber Solution Vulcanized by the Ultra-Violet Rays" and the other on "Vulcanization." The two subjects were, as a matter of fact, dealt with as one paper. They provided what might be termed the sensation of the Congress. A very animated discussion ensued. The idea put forward was a new one and it brought out some very interesting remarks from Sir Wm. Ramsay. The joint authors of the paper claimed to have arrived at a solution of a problem of depolymerization and re-polymerization, but it was not claimed that it could be applied to general vulcanization. Helbronner stated that in the course of his experiments he made about one hundred analyses. It may be added that the sample which was handed round to demonstrate the effect of their solution was generally considered hardly satisfactory. In this instance the chairman had to bring the discussion to a close after expressing a hope that it might be possible to reopen it at a later stage.

PROBLEM OF THE DAY.

Another very important paper, dealing, as it did, with the question of the day, was that by Dr. Schidrowitz on "Variability," although, as the author put it, his treatment of the subject was only to be regarded as quite preliminary. One fact that came out in the ensuing discussion was of great interest. Dr. Schidrowitz, in explaining a point in connection with average results, stated that he obtained superior results from the better types of plantation rubber than from average washed samples of fine hard Pará. "Whereas," he remarked, "we frequently get a genuine index figure from plantation rubber, unwashed, of well over 1,000, the average fine sample of washed Pará becomes rather lower, the figure in this case being something like 900." In reply to a remark by Mr. W. A. Williams as to the "human element" in mixings, Dr. Schidrowitz asserted that one could, to a very large extent, get over this difficulty by using one of the new type of mechanical mixers, which eliminates handling.

MR. P. L. WORMLEY'S PAPER.

Much interest was also displayed in the paper on "Influence of Temperature on Physical Properties of Rubber," by Mr. P. L. Wormley, of the United States Bureau of Standards, and in that by Mr. D. E. Douty, of the United States Conditioning & Testing Co., on "Some American Methods of Testing Mechanical Rubber Goods." In connection with the former paper much curiosity was evinced as to the methods employed in the Bureau of Standards at Washington. The chairman remarked that the influence of temperature upon rubber was of great importance and had not hitherto received adequate attention. In reply to a question as to whether any attempt had been made to separate the effects between the greater distensibility of the rubber at high temperature and its expansion or contraction, Mr. Douty answered in the negative and added that the speed at which the rubbers were stretched was so slow that there was no danger of heating up. Dr. Esch observed that a temperature of 70 degs. in a test for elongation and tensile strength would not be practicable with mixings containing balata or gutta-percha. In reply Mr. Douty pointed out that it was not proposed to make one standard temperature for all tests, but to determine the temperature at which tests for certain goods should be carried out.

"ABNORMAL EFFLORESCENCE OF DISCOVERIES."

At an exhibition devoted almost entirely to natural rubber and its means of exploitation, and among men who had so much at stake in a like connection, it is scarcely to be wondered at that the paper on "Synthetic Rubber," by M. Gaston Chardet, should have received a somewhat frigid reception. Yet the author handled his subject cleverly and impartially and not without touches of subtle humor. "In that department of organic chemistry," he observed, "a phenomenon unique in the history of science had been witnessed, an abnormal efflorescence of discoveries and of patents launched upon the world by inventors, well meaning if not always the most capable." Chardet virtually admitted that rubber synthesis is a subject only of academic interest. He complained that in such investigations the public saw only the money result. The result was nothing—the effort was everything; and the value of the work must not be measured by its success. Synthetic rubber was not a great industrial discovery, but it would be none the less a great scientific discovery.

One may imagine that the utilitarian element was uppermost in M. Chardet's audience. Dr. Slocum, who read the paper, appeared to disapprove of it almost in its entirety. His view was that the chemist interested in synthetic rubber should devote his attention to producing a new rubber rather than in competing with the existing forms of natural rubber. He thought the production of a new gutta-percha or balata was the happiest thing for the synthetic chemist to aim at. Furthermore, he questioned the possibility of the by-products being of any real commercial utility. The whole subject was apparently regarded with so little interest by the Congress that after the few remarks of Dr. Slocum discussion entirely ceased.

A COINCIDENCE.

A paper on "Experiments in the Direct Determination of Mineral in Rubber Mixings" was described by Dr. Torrey as one of the most instructive ever provided on the subject. The authors were Messrs. B. D. Porritt and R. Wheatley, the former being the chief chemist of the North British Rubber Co., Ltd. A significant coincidence occurred in connection with this paper. Another on precisely similar lines had been volunteered by Mr. H. Williams Jones and although the authors had not conferred together in any way they arrived at conclusions practically identical.

This brief survey does not, of course, cover the whole of the papers read at the conference. Attention has merely been given to those which aroused the greatest interest and gave rise to most discussion. It is understood that the entire series will shortly be published in book form, when those who wish will be enabled to study them in detail.

ENGLISH ARMY BUSINESS IN WATERPROOF GARMENTS.

According to latest reports, the production of waterproof fabrics has not equaled the demand. One large order for garments, placed some weeks ago by the English Government, exhausted the whole available stock of heavy sateens and similar fabrics.

All stocks of heavyweight coats have been cleaned out and further orders placed for thousands more. Large government orders for motorcycle suits took off all stocks of goods for that purpose and necessitated placing further orders.

This unexpectedly large business has caused overtime work in the garment industry, the demand exceeding anything ever looked for.

SWIMMING COLLARS FOR BRITISH NAVY.

The British Admiralty has recently arranged for a supply of swimming collars to be distributed to the officers and men of the fleet, and instructions have been issued that this protective device be worn by the men when awake, and kept inflated and near each man when he is asleep.

"GALBULOSE," A NEW PROOFING.

JUST what "Galbulose" is made of the inventor, William MacIntosh, of Liverpool, England, refuses to state. He does say that it is a chemical combination of a fossil resin and cellulose. The raw product looks like sheet balata, and this, treated with a certain solvent, is spread on cloth for proofing, just as rubber is. The product, he it said, is called "Zama" cloth. Mr. MacIntosh has a factory near Liverpool, operated by the Zama Co., Ltd., and an American factory at Springside, Stamford, Connecticut. This is called the British American Manufacturing Co. He claims to have orders for army blankets, tents and ponchos from the British and French governments and to have sold some four hundred thousand yards to the United States government.

As an old rubber man, Mr. MacIntosh ought to know what the trade calls tar-in-coated rubbers. He started with the North British Rubber Co., Ltd., in 1880, and was with them for ten years. Then he went to the Harburg-Wien Co., then back to England to the Silvertown Co. After a bit he went with the Austrian American Co., then with the Continental at Hannover, then with Reithoffer in Austria, then with Klinger in Hungary. Leaving the German speaking peoples, he spent three years in the rubber shoe factory at Malmo, Sweden, after which he signed up with the International Co. at Brussels, Belgium. In 1907 he returned to England and engaged in proofing on his own account—and Galbulose is the result. At present he is making, besides army blankets and ponchos, hospital sheet, aeroplane double texture cloth, etc.

ENGLISH CONFIDENCE RESTORED.

On the declaration of war, English rubber manufacturers and dealers in rubber goods felt much alarmed at the prospects. The prompt action of the Government in taking over private cars and in purchasing liberally from manufacturers, speedily re-

1. PONCHO AS WORN WHEN CARRYING ARMS. 2. CAPE WHICH COVERS BLANKET AND EQUIPMENT WHEN MARCHING. 3. AS A GROUND SHEET OR SLEEPING POUCH. 4. SLICKER SHOWING OPENING FOR CAVALRY.

stored confidence in various important lines. These conditions have become still more favorable by the fact that the owners of the cars requisitioned have been placing orders for new vehicles, and that the war office is continuing to order motors freely.

The present war is one of motors; every conceivable form of automobile having been impressed in thousands into the service of the English and Continental armies.

ENGLISH MOTOR AND TIRE BUSINESS.

An enormous order for motor cars is said to have been secured from the Russian Government by the Austin Motor Company, which, it is understood, will indirectly benefit the Dunlop Tire Co., whose tires have been in the past largely used by the above-named company.

The Birmingham depot of Pirelli & Co., Milan, has received an important shipment of tires and cables from its Italian factory. This concern has been showing the "basket" tire, a new model, 32 x 4 inches, which has non-skid qualities but dispenses with the use of steel studs.

The accepted authority on South American rubber—"The Rubber Country of the Amazon," by Henry C. Pearson.

PONCHOS USED AS A TENT.

Rubber Notes From Germany.

SINCE the declaration of war rubber manufacturers have been in many cases very busy on government contracts. Technical articles, automobile tires and hospital supplies have been the chief features of recent production.

While these government contracts have made some concerns very busy, their importance must not be overestimated. Although intrinsically of importance, they do not make up for the lack of export trade they involve. On the whole, the rubber industry is suffering from the absence of its working force, which has in many cases necessitated operating on short time, and in some instances complete suspension.

Another source of trouble has been the fact of the government claiming the available stocks of benzine and benzole, in order to provide for the prospective requirements of military motor traction. When this claim was first made, the details of the existing stock were not known and there were well-grounded fears of a deficiency. Any such scarcity would have affected the supply of solvents for the rubber industry. Fortunately, it is now ascertained that there is a sufficient stock of these articles at the disposal of the government to provide for the requirements of motor traction and the fears of rubber manufacturers have been dispelled to such an extent that numerous plants are in operation which had been working on a reduced scale under the apprehension of a dearth of solvents. The government authorities have facilitated the execution of their own orders by permitting the use of the necessary solvents by the manufacturers for that purpose.

At an early period of the hostilities, a suggestion was made for the establishment of maximum prices for rubber, but the conclusion was reached that in view of the present difficulties attending transportation, such a course was undesirable. The principal works are said to be supplied with enough rubber for several months' consumption.

ENGLISH OPPOSITION TO GERMAN PATENTS.

A recent Paris report stated that the English government had declared all German patents and trade-marks outlawed. Further information showed that the above statement was not strictly correct. The facts were that a law enacted gave the Board of Trade authority to make regulations for the total or partial revocation, or for the temporary suspension, of patents or trade-marks for the protection of subjects of a power at war with England. The regulations issued by the Board of Trade are said to leave it to the interested parties to impugn the patents and trade-marks which protect natives of countries at war with England, or which are opposed to English interests.

For this purpose an application to the Patent Office is needed, in which the applicant has to show that he has a serious intention of operating the patent, or of marketing the goods protected by the mark, and that his application is in the public interest.

When these conditions have been fulfilled, the patent or mark attacked can be declared invalid or can be put out of force until further notice. As the fulfilment of the conditions named presents no difficulties to the interested parties, this plan is regarded in Germany as being equivalent to the abolition of protection to Germans by England.

The question of retaliation has been occupying the attention of the German government, representatives of which have been in communication with the rubber industry.

EXPORT TRADE WITH NEUTRAL COUNTRIES.

German manufacturers, while recognizing the difficulties now attending export trade with their former customers, have been giving attention to the question of conducting such trade with and through neutral countries, or with German houses in the markets

they wish to reach. They hope in this way to parry the attacks of England in her "war to the knife" commercial policy. Germany and Austria have made joint preparations for warding off the threatened danger.

From another point of view, Germany feels that she is too good a customer of various foreign nations for them to risk with indifference the loss of the German market.

CAMPAIGN REQUIREMENTS IN RUBBER GOODS.

Among the articles now being made by German manufacturers for service in the war are "Bandage Packages" intended to be carried by the soldier for his own use. They contain a sterilized strip of wadding, attached to a muslin bandage and covered with cambric. This outfit is sterilized and, according to its composition, packed in paper, waterproof fabric or similar material. It is fastened with a safety pin or with clips. Its practical value is that a soldier might bleed to death if he had not provided himself with one, or if a comrade had not this "self-bandaging" equipment. Pocket drug outfits also come under the same heading.

Inner soles of rubber and other materials are likewise worn to a considerable extent, but half soles have the disadvantage of creasing in the boot. For the special use of reservists who have exchanged a sedentary for a military life, rubber-sponge soles have been much approved as preventing the dreaded "horny skin" on the soles of the feet. Its durability renders the rubber-sponge sole particularly suitable for use in war.

Toilet bags (waterproof) form another group and are meant to carry a piece of soap, a rubber sponge, a tooth brush and other necessary articles.

Waterproof clothing has become an important item of military equipment, particularly in the form of waterproof vests of rubberized material, as a protection against being "drenched to the skin." The importance has been urged of rubber goods manufacturers retaining their hold on the trade in these articles and not letting outfitting houses take it out of their hands. For saving uniforms, mantles have been brought out which are specially adapted for that purpose, being very light and thin. Another article is the "breast bag" for carrying various articles, as well as the rubber drinking cup. Thus in many objects of general utility, in addition to medical supplies, rubber contributes to the soldiers' comfort.

THE WAR AND THE GERMAN RUBBER INDUSTRY

For three weeks after the declaration of war by Germany freight traffic was practically suspended, only the requirements of the army and navy, or those for maintenance of the railways, being transported. The removal of the prohibition improved the situation, in which improvement the mining industry largely participated. Prices for all raw materials have considerably advanced, increased rates for asbestos products, steam packing and technical rubber goods being regarded as unavoidable in the near future. Crude asbestos cannot enter Germany from its principal sources (Canada and Siberia). Each factory having to depend on its stores of the article, it is predicted that the manufacture of articles composed of rubber and asbestos will soon come to a standstill.

The whole rubber industry is reported to be stagnant, many plants being closed down. The export of balls, toys, etc., has almost completely ceased, and it is thought that imports of crude rubber will be for a long time on a reduced scale. As to coal and other raw materials than those above referred to it is understood that the rubber industry is sufficiently provided with supplies. The hands necessary for the manufacture of tires for

automobiles, motor trucks and bicycles, as well as of surgical articles, have been released by the military authorities.

Many plants in Eastern Prussia have been destroyed by the Russian invading forces. What the ultimate salvage may be it is impossible to define at present.

ADVERTISING RUBBER CLOAKS AND SHOES.

In spite of the war and the reduced purchasing capacity of the general public, German manufacturers still anticipate full demands for rubber cloaks and rubber shoes, encouraged by advertising. This year, however, German goods will be asked for in place of English cloaks and Russian shoes—the demand being well within the capacity of the German industry. Preparations were made in the early part of the year, and a scarcity of goods is therefore not anticipated. The importance has been urged of manufacturers maintaining prices for German products of standard quality, instead of diminishing the value of the goods by cut prices.

LIBERAL ACTION OF EMPLOYERS

Every effort has been made to help the families of the workers called to the front. In some cases the families of the married men are drawing full salaries, while in most cases half wages are being paid. These payments are supplemented by contributions from the factory benevolent funds and from private sources. In the case of Traun & Sons, Hamburg, the factory fund had been running 100 years. The plant of Philip Penin, Leipzig-Plagewitz, has only dismissed a few hands, and has kept in nearly full operation.

DEATH OF A VETERAN GERMAN RUBBER MANUFACTURER.

At the ripe age of 92, Privy Councillor Wilhelm Herz passed away on September 28. He had been at the head of the well-known Berlin rubber manufacturing firm, S. Herz, and his end was a surprise to his many friends, who had been witnesses of his activity up to within a fortnight of his death. His memory will long be cherished as the Nestor of the German rubber industry.

GERMAN CONTRACTS FOR FOREIGN RUBBER SHOES.

In answering a correspondent who had asked the position of contracts for St. Petersburg and Edinburgh rubber shoes, the "Gummi-Zeitung" lately wrote that all purchases and contracts in themselves remain in force notwithstanding war, but if the war renders delivery impossible, buyers and sellers are released from their obligations without having claims for compensation.

Hamburg shipping agents are advertising steamer facilities to oversea countries from Amsterdam, Rotterdam, Copenhagen, Stockholm and Göteborg. The "Hansa Alliance" has opened an office at Stettin for the guidance of manufacturers desirous of shipping through neutral Scandinavian ports.

Among the large contributors to the German war loan is the Continental Caoutchouc & Gutta Percha Co., of Hanover, which has signed for nearly \$50,000.

AUSTRIAN PROHIBITION OF RUBBER IN TRANSIT.

According to an Austrian ministerial ordinance of September 11, india rubber, gutta percha, balata (crude or purified, as well as waste from those substances, and also rubber substitutes) are included among the articles of which the export and transportation are prohibited.

"SEMPERIT" WORKS PROVIDING FOR FAMILIES OF WORKMEN CALLED TO WAR.

The "Semperit" Austro-American Rubber Works, of Vienna, is paying full salaries to the families of married workers called to war, and to the representatives of unmarried workers a long time in its service, while those of the workers who have been a short time in its employment will draw half salaries.

GERMAN RUBBER MEN SUPPOSED PRISONERS OF WAR.

At the opening of the campaign, Messrs. Clar and Tenz, natives of Germany, section managers at the Colonial rubber plant in Ghent, were taken prisoners. Not having been heard from since, their friends are becoming anxious regarding them.

MINERAL LUBRICANTS SCARCE.

The reduction of imports, in conjunction with the fact that the government has taken possession of the stocks of lubricants, has produced serious trouble. Prices have considerably advanced, which is to the benefit of firms holding stocks. Imports of Russian oils have entirely ceased, which renders it necessary to have recourse to the more extensive use of American oils, in some cases mixed with vegetable oils. The oil business is the most active in the technical branch, while rubber and asbestos are relatively quiet.

AN EDITOR BECOMES A LIEUTENANT.

Dr. Karl Gottlob, chemist of the Farbenfabriken, formerly Friedr. Bayer & Co., Elberfeld, is an Austrian infantry lieutenant in the present campaign. Dr. Gottlob is well known to the rubber industry as the editor of the "Gummi-Kalender."

ENGLISH RUBBER IMPORTS (IN TONS) FOR MONTH OF SEPTEMBER.

From—	1912.	1913.	1914.
Straits Settlements	915	1,600	1,700
Federated Malay States	600	1,000	715
Ceylon	410	709	1,130
French West Africa	77	47	5
Gold Coast	27	19	8
Brazil	1,034	657	522
Peru	145	116	13
Other countries	1,150	1,765	1,016

Total, September 4,358 5,913 5,109

Total for eight months to the end

of August 34,805 46,421 44,427

Above figures are those of the English Board of Trade for the month of September for the last three years, and show the falling off in wild rubber, as well as the gain in plantation grades.

RAINCOATS IN THE ENGLISH ARMY.

There is vastly more fight in a dry soldier than there is in a wet one, or at least in one who has been very wet for a

long time. Here are illustrations showing weatherproof garments which are made both for the British infantry and cavalry. The first cut shows the service dress in which the wearer, while unencumbered by a long coat, is still thoroughly protected from inclement weather. The other cut shows a long raincoat coming well below the knees, being full in the shoulders and sleeves and having an ample width of skirt so as not to impede the wearer's movements. [Burberrys, Haymarket, London.]

FRENCH OPINION OF VALIDITY OF CONTRACTS.

The Chamber of Commerce of Toulouse has officially pronounced the opinion that war does not in itself annul contracts; only doing so in the event of business being brought to a stop. Such is the general view of the French Chambers of Commerce, founded on the opinions expressed by jurists after the war of 1870.

German Rubber Toys.

WITH the practical cessation of the German export of manufactured products of almost every name and nature, comes the call, the world over, for the substitution of the same goods of other makes.

At this time of the year none are more clamorously sought than toys. What a rubber industry Germany had built up of toys of all kinds, the whole world knows. The total yearly exports in toys and games, as given by a British compilation of statistics, amounted roughly to \$7,017,201. This, of course, means toys of all kinds, but among them rubber

got to be very expert in turning them out. The molds as a rule were of soft metal and made in one of the factory departments. A special type of mold, it is said, was made for certain of these goods out of soapstone. This of course was a matter of hand

engraving and difficult. Certain artisans, however, expert in all kinds of engraving, did wonderful work and that very cheaply.

Soapstone molds have to be used with care and are only fitted for goods that do not require cooling. The stone keeps its heat a long time and gives an even, gentle heat.

These toys were made up in plain white, or red, and oftentimes in white rubber, gorgeously painted. They were all artistic conceptions, artistic even in their grotesqueness, and were cre-

toys were produced in greater quantity than anywhere else in the world.

In a great many of the German factories immense departments were devoted to the production of rubber toys alone. One factory whose toy molds ran into tens of thousands possessed different types for over 500 varieties in ordinary use. These embraced for complete dolls 100 patterns; dolls' heads, 20 patterns; animals, 100; birds, 26; soldiers, 50; reptiles, 10, and combinations — soldiers and riders — and novelties, many hundreds.

These rubber toys were very largely made by hand and where popular types continued year in and year out certain workers

ated to appeal to children in all parts of the world.

From the hundreds of types a few typical illustrations serve

to prove the excellence of the German rubber toys, an excellence it will be difficult for any manufacturer to equal at short notice.

JAPANESE INDUSTRY AND THE EUROPEAN WAR.

By Our Regular Correspondent.

GOING back some 20 years the development of the Japanese rubber industry is shown by a comparison between the imports of the crude article at different periods:

	Pounds.	Value.	Period.
1894.....	36,100	\$12,888	China-Japan War.
1895.....	27,553	11,556	
1904.....	485,284	284,327	Russo-Japanese War.
1905.....	733,836	422,975	
1912.....	2,004,030	1,514,557	
1913.....	2,681,943	1,725,922	

A similar, though not proportional, development took place during the period named in the Japanese imports of rubber manufactures: 1894, \$94,593; 1895, \$153,375; 1904, \$796,599; 1905, \$1,742,221; 1912, \$5,275,815; 1913, \$4,043,469.

While it may thus be seen that the previous wars in which Japan was engaged were apparently of benefit to the rubber goods import trade of that country, such is not likely to be the case with the present hostilities. On the earlier occasions, the contests were only between two countries, without serious injury to steamship lines and foreign trade, while the present war affects European, Asiatic and other commerce, particularly that of Germany with those markets. The consequent disturbance of trading relations has led to advances in the Japanese prices of crude rubber, compounding ingredients and accessories.

CRUDE RUBBER.

On the outbreak of the war plantation biscuit rubber advanced in Japan from 1 yen (50 cents) to yen 1.60 (80 cents) per pound. At time of writing it had declined to yen 1.30 (65 cents). As to the future course of the market the opinions of consumers are divided. Some consider that within a few months a good deal of crude rubber will be imported to Japan. Hence manufacturers holding these views are not disposed to increase their stocks at present prices. Others, on the contrary, see prospects of values being maintained, not recognizing the likelihood of large early imports. Rubber traders are selling or keeping their stocks according to their opinions as to the future course of the market.

COMPOUNDING INGREDIENTS.

A marked advance has taken place in compounding ingredients for the rubber industry. Glycerine has risen 400 per cent.; lithopone 250 per cent. Colors have likewise advanced, 80 per cent. of the supply coming from Germany. Dealers are indisposed to handle German colors in view of the uncertainty of receiving them in case the war is protracted. Japanese manufacturers have been making some ingredients, but have been advancing prices. The zinc white made by the Nipon Paint Manufacturing Co., of Tokio, has risen from yen 11.50 (\$5.75) to yen 16.50 (\$8.25) per 100 pounds, being made from high-priced imported zinc. Magnesia has likewise gone up. Some ingredients have been notably scarce, such as litharge, of which the Naval Department bought up many tons at the opening of the war.

SCRAP RUBBER AND ACCESSORIES.

Activity is not looked for in the Japanese scrap rubber market, which has so far been dull this year. The principal imports come from Shanghai, and any disturbance of steamer communication with that port would be reflected in the Japanese market.

Coal, oil, cotton cloths and metals have generally advanced from 10 to 50 per cent.

POLICY OF JAPANESE MANUFACTURERS.

Efforts made to establish a combination of important manufacturers have proved void of result. A conference recently took place between seven representatives of the four largest Tokio rubber manufacturers: Mitatsuchi Rubber Manufacturing Co., Meiji Rubber Works, Nipon Rubber Co., Limited,

and Toyo Rubber Co., Limited, with a view to a general advance in prices. The combine was, however, not formed, in view of the fear being entertained of competition from outside manufacturers. It was further apprehended by the makers present that by putting up prices they might lose their agents or their customers. Confidence was, moreover, expressed in being able to produce goods at lower prices, to meet competition.

The Japanese authorities are urging the use of domestic made goods instead of imported merchandise, thus adopting the policy being carried out by England. Various patriotic associations are working for the same end, particularly as to bicycle tires.

In 1913 the total Japanese imports of rubber manufactures were \$4,043,469, of which Germany supplied \$1,231,774 and Austria-Hungary \$3,525. Germany supplied crude rubber to the extent of \$18,000.

It is anticipated that the result of the war will possibly be to decrease Japanese imports of rubber manufactures and to increase those of crude rubber. Japanese manufacturers foresee an important development of export trade. The last-named branch of commerce already includes rubber clothing, insulated electric wire, rubber balls and rubber toy balloons.

PRIZES AT THE RECENT TOKIO "TAISHO" EXHIBITION.

The awards at the recent Tokio Taisho exhibition included the following: HONORABLE GREAT MEDAL—Mitatsuchi Rubber Manufacturing Co., Tokio; Yokohama Electric Wire Works, Limited, Yokohama.

GOLD MEDAL—Fujikura Electric Wire Co., Limited, Tokio; Meiji Rubber Works, Tokio; B. F. Goodrich Co., Akron, U. S. A.

SILVER MEDAL—Dunlop Rubber Co. (Far East) Limited, Kobe; Toyo Rubber Co., Limited, Tokio; Nipon Rubber Co., Limited, Tokio; Fujikura Electric Wire & Rubber Co., Tokio; Kakuichi Rubber Co., Osaka.

THE RUBBER INDUSTRY IN THE FEDERATED MALAY STATES.

From the Interesting Report of the Director of Agriculture.

LAST year the Federated Malay States produced 23,719 tons of plantation rubber, against 15,506 tons in 1912. This is just over one-half the world's supply which has been computed at 47,000 tons for 1913. The total estate production of Malaya, however, is returned at 28,214 tons, an increase of 9,266 tons over the previous year. The largest increase outside the Federated Malay States comes from Malacca, where the production was doubled during the year, and that Settlement now follows Selangor and Perak in production.

Selangor exported 11,883 tons, Perak 7,659, Negri Sembilan 3,995 and Pahang 182.

It is stated in the report of Mr. L. Lewton-Brain, Director of Agriculture, Federated Malay States, that the area newly planted in 1913 was only 34,127 acres, compared with 54,105 acres in 1912; 107,200 acres in 1911, and 48,821 in 1910. The increase is larger than might have been expected, however, in view of the fall in the price of rubber, and shows that some investors recognize the real soundness of the industry. Selangor maintained the position of having the largest rubber acreage, nearly 195,000 acres, compared with 142,000 in Perak and 96,000 in Negri Sembilan.

The rubber acreage producing in the Federated Malay States is returned at 164,390 acres, an increase of about 28,000 acres over the preceding year. The average yield per acre works out at 275 pounds, and when it is considered that about one-fifth of the whole bearing area has been taken in during the past two years, it will be granted that an estimate of 400 pounds per acre from rubber in full bearing is not too optimistic.

The fall in price, although its rapidity was unfortunate, has not been without its good effects on the plantation industry.

Estates throughout the country have overhauled their expenditures, which had, perhaps, got rather out of hand during the continuance of high prices, and many economies have been effected in all directions.

WILD VERSUS PLANTATION RUBBER.

Inferior grades of wild rubbers, it is expected, will no longer be able to compete with the cleaner and better plantation product, and with an increasing consumption of rubber, even only on past lines, the virtual disappearance of inferior wild grades should steady the market for the cultivated product. The full effect of this, of course, cannot be seen at once, as stocks of these grades had to be disposed of even at unremunerative prices. If manufacturers can expect a steady market at about present prices, there is little doubt that fresh uses will be found for rubber, and thus the increasing supplies of the plantation product coming forward during the next few years will be absorbed.

The estates that suffered worst from the rapidity of the fall in price are those which had only a part of their acreage in bearing and had calculated to use the profits on this to carry the younger areas on to the producing stage. With profits falling off as they did, it was impossible to carry out the original program, and at the same time the issue of fresh capital was rendered very difficult. It was no longer profitable even to tap some 4-5 year old areas which had been counted on to yield a fair profit at 3s. (72.98 cents) per pound. The Planters' Loan Fund of the Federated Malay States Government has been of great assistance to many estates in this predicament, and the capital of the fund was increased by a further \$1,000,000 during the year, but this new capital was available only for private owners and syndicates and local companies.

A WORD OF ADVICE.

It may now be assumed that rubber can be produced f. o. b. by many estates at 1s. (24.33 cents) per pound. Estates with large areas of older rubber and those favorably situated can produce for less than this; but it is not suggested that the majority of the estates will be able to produce at this price for some years.

The increase in the yields from trees as they mature and the reduction in the number of trees per acre by thinning out will insure automatically a steady drop in the cost of production on younger estates. This should be increased by a careful and sound economy, but Mr. Lewton-Brain points out that everything that reduces expenditure is not necessarily economy. In particular, to cut down supervision beyond the point of efficiency is no more true economy than it would be to reduce expenditure on weeding to such a point that the trees become smothered in lalang. Economy in manufacture also seems to him to be carried out on wrong lines; small buildings are often put up when an estate is coming into bearing, which must obviously be scrapped in a year or two, and all work is done by hand. Provided that money is available, it would seem sounder economy to plan from the first for the future requirements of the estate.

CULTIVATION.

In his report Mr. Lewton-Brain makes some important remarks on cultivation and the preparation of rubber for export based upon experiments carried out by various members of the scientific staff of the Federated Malay States Department of Agriculture.

Wider planting is advocated for more rapid growth of trees and more substantial yield. The general view now is that not more than 100 trees should be planted originally to the acre and that eventually about 40 or 50 to the acre should be left. A number of influential planters even favor planting originally not more than 50 trees to the acre. The change that has occurred since a few years ago, when 180 to 200 trees were usu-

ally planted, and when 100 trees was regarded as the proper and ideal number to work to, is quite remarkable.

Catch-crops are still in little favor and no planter will adopt this form of cultivation if he can avoid it. Indigo has not proved a success, but with wider spacing between the rubber trees there are possibilities for coffee cultivation as a remunerative crop.

Cover crops that are not revenue producing are also little in favor among Federated Malay States planters, though a tendency to use them on steeper hillsides is noticed. Mr. Lewton-Brain enumerates certain advantages to be derived from good cover crops, however, and he also deals with manurial experiments and methods of tapping, and mentions that cultivation of soil as distinguished from the standard clean-weeding is being adopted on a good many estates. In this latter connection he states that an interesting series of experiments has been started at Castleton Estate, Telok Anson (belonging to the department) to test the cost and effects of different systems of cultivation on this type of soil, combined with tests of cover-crops. Experiments in the use of dynamite for cultivation have also been made at Kuala Lumpur and at Castleton, and assistance has been given to a number of estates which were also experimenting.

In regard to tapping Mr. Lewton-Brain says it is clear that if the cost of production per pound of rubber is alone to be considered, the manager will undoubtedly select the alternate day system; incidentally, he will, of course, postpone tapping his trees at all as long as possible. He emphasizes the fact that it is not the profit per pound of rubber produced that alone should be considered, but the profit made per acre, and too much insistence on the reduction in cost per pound of rubber produced is therefore dangerous.

EXPERIMENTS IN MANUFACTURE.

There has probably been more discussion and writing about the subject of plantation rubber manufacture than during any period since the beginning of the industry. The steadily falling price of the plantation product and the disparity in price between this and the hard Para brought forward innumerable suggestions and theories to explain the supposed inferiority of the plantation product. What manufacturers do complain of, as regards plantation rubber, is not that it is not good, but that it is not uniform in the qualities on which they depend in the manufactured article. Each lot has to be treated differently, otherwise the final product is not of the same quality.

Having stated the problem, Mr. Lewton-Brain sets himself to deal with the solution, and sets forth the experiences of the experimental vulcanizing and testing station established by the Federated Malay States government at Kuala Lumpur. It is one of the most complete in existence. The problem of the variability of plantation rubber is an extremely complicated one, much more so than appears at first sight, and it will probably be years before the full value of the work to be undertaken can be realized. It is at any rate satisfactory to record that the first step has been taken and that real work on the fundamental problem of rubber manufacture has been started. Generally speaking, much more care is being taken on the larger and better equipped plantations to keep their methods and products as uniform as possible, but it is regrettable, he writes, that methods on so many estates are still so haphazard.

The experiments carried out dealt with smoking, drying, dilution of latex, coagulation, fungus "spots," tackiness, etc., and in conclusion Mr. Lewton-Brain deals with insect and other pests of the rubber tree and fungus diseases.

People interested financially in the plantation rubber industry will doubtless be gratified to learn that additions have been made to the staff of the agricultural department and that the Government of the Federated Malay States is doing so much to safeguard the interests of rubber growing, which has become the chief agricultural industry of the country.

Some Rubber Planting Notes.

STATISTICAL POSITION OF RUBBER.

COMING at such a late period of the year, the meeting of Harrisons & Crosfield, Limited, held in London on October 13, was of special interest. As it will be recalled, this company acts as secretary for a number of plantations, and is thus in closer touch with market conditions than any individual estate would be.

In addressing the meeting, Mr. C. Heath Clark, the chairman, remarked that last year the world's production of rubber was 117,000 tons, while consumption represented a slightly larger quantity. The present war conditions render it almost impossible to forecast correctly the rubber market. Two large consumers, Germany and Austria, have been cut off from supplies. It therefore remains to be seen how far the other European countries, together with America, will utilize the whole of the world's production.

Existing conditions he regarded as distinctly favorable. The English stocks, which had been at the end of July 5,543 tons, had fallen by the end of September to 5,416 tons, as compared with 5,859 tons in stock a year ago. Dealing with plantation rubber alone, he adverted to the fact that the total quantity landed in England during the first nine months of the current year had been 30,801 tons, against which there had been deliveries of 30,425 tons, practically the total quantity received having thus gone into consumption.

Since the commencement of the war demand has proved quite satisfactory, prices having been well maintained. A certain falling off in some branches of consumption may have taken place (such as motor cars for pleasure purposes), but there will be an increased demand for motor vehicles to do the work of the world and replace the horses withdrawn for military purposes. Prices during the current year have, on the whole, been maintained better than was anticipated, first grade plantation rubber being somewhat higher in September than it was a year ago.

A feature of importance to the rubber industry has been the reduction in costs, an average saving in the "all-in" (or inclusive) price of 6d. per pound having been effected in some ten cases investigated. This reduction he expected to continue, and to be further developed under the strict economy now being exercised in the management of estates by reason of the war. The same cause may probably lead to a reduced production. All needless capital expenditure will cease, and tapping will be avoided until the trees can show a profit.

He anticipated that the collection of wild rubber would continue to show a decrease, the falling off being attributed to difficulties of financing rather than to low prices. Figures show that the rubber exports to England from sources other than the Far East were, during the first nine months of the current year, nearly one-third less than during the corresponding period of last year.

In conclusion, Mr. Clark expressed the opinion that there would be a continued further decrease in supplies from the sources competing with the Far East, adding that whatever might be the temporary effects of the war on the rubber industry, it would still give handsome returns on the capital invested.

SUNGKAI-CHUMOR ESTATES, LIMITED (FEDERATED MALAY STATES).

By the directors' report, presented at the eighth annual meeting of the above company, on October 7, the total area is 1693.8 acres, of which 1469.5 acres are under rubber. The total quantity collected for the year was 347,621 pounds, against a yield for the previous annual period of 279,354 pounds. A quantity of 355,000 pounds is estimated for the year ending June 30, 1915.

The gross price realized was 2s. 3.25d. (55.24 cents) per pound, while the inclusive cost was 1s. 3.71d. (31.9 cents), as com-

pared with 1s. 9.76d. (44.1 cents) for the previous year. For the year ending June 30, 1914, the dividend amounted to 30 per cent.

SECRETS OF PLANTATION SUCCESSES.

The four following axioms have been laid down for the guidance of plantation companies: 1. Close the capital account as soon as possible, so as not to annihilate the progress of the enterprise by an accumulation of financial charges. 2. During the earlier years take all expenses from revenue, without yielding to the temptation of the premature distribution of dividends. 3. Do not increase the planted area beyond the limits allowed by the treasury. In other words, no loans based on the alleged necessity of extending the plantation. 4. Maintain a very capable administrative staff, constantly looking out for economies which might be carried into effect.

HEVEA IN COCHIN CHINA.

A recent number of the Annals of the Rubber Planters of Indo China contains a protest against a statement that the climate of Indo China is relatively too dry for *Hevea*. It is claimed that within the suitable degrees of latitude *Hevea* flourishes admirably. The dry season of four months in no way impairs its growth, while it serves as a protection against the diseases with which Malaya has to contend. As to the output, the yield for 1913 exceeded 4½ pounds of rubber per tree for trees with an average age of 12 years.

"PINK DISEASE" ON MALAYAN RUBBER PLANTATIONS.

In recently addressing the Central Perak Planters' Association Mr. F. J. Brooks, Government Mycologist of the Federated Malay States, expressed the opinion that "Pink Disease" was the most serious of the affections to which rubber trees are subject. The disease was first noticed in 1904, but its spread has been particularly remarked during the last 18 months.

At present it is chiefly found in southern Perak, its ravages extending to northern Selangor. It has likewise been observed in northern Perak, Negri Sembilan and Telok Anson, spreading after heavy rainfall and in thickly planted sections. The disease is caused by a fungus, which attacks every part of the tree above the ground with the exception at first of the leaves. When it has penetrated the bark it extends upward and downward and produces decomposition, the leaves and the affected branches commencing to decay and perish. The disease is most noticeable with trees from 3 to 10 or 15 years of age.

The best means of coping with the "Pink Disease," in Mr. Brooks' opinion, is the system of "Disease Brigades." This is carried out by a sufficient number of men being detailed to go over the whole plantation every three or four weeks so as to deal with the rubber trees and other vegetation affected.

In conclusion, Mr. Brooks expressed the opinion that planters should not be discouraged by the "Pink Disease," as plantation rubber is one of the healthiest of the cultures at present flourishing in the Malayan Peninsula.

ADDITIONAL CUSTOMS DUTIES IN PORTUGUESE ANGOLA.

By a law passed on July 22 last, the following additional customs duties have been levied to defray the cost of public works in the Portuguese Province of Angola:

On all exports from the Province, 1 per cent. ad valorem.

On rubber exported from the Province, 3 per cent. ad valorem.

On all products (except wines from Portugal or Portuguese colonies) imported through ports outside the Conventional Basin of the Kongo, 2 per cent. of the import duties.

Provision is made for the reduction or suspension of the export tax on rubber, according to the price of rubber in European markets.

THE WAR AND THE RUBBER AND BALATA INDUSTRIES OF DUTCH GUIANA.

By Our Regular Correspondent.

IN the September number of THE INDIA RUBBER WORLD mention was made of a company being formed in Paris for the purpose of operating certain wild rubber tracts situated in the Para district, Dutch Guiana. The capital subscribed was francs 5,000,000, or \$1,000,000, which would have paid the owners of the lands and left a considerable working capital.

Every arrangement was made for beginning operations, an expert was sent out to Dutch Guiana to examine and take over the concessions, when, all of a sudden, the accursed European war broke out, and a sudden stop to the whole business was the consequence. These concessions are again in the market, and this time, we understand, can be had for considerably less than the amount subscribed by the French concern. We have been informed on good authority that no reasonable offer will be refused by the proprietors of these lands. This is undoubtedly an opportunity for American capitalists on the lookout for good bargains.

The war has had a very bad effect on local industries, and the balata industry has especially fallen a victim to the consequences of this terrible conflict. The entire community, with very few exceptions, is suffering for want of employment and the means of earning a living. The balata industry alone employed about 5,000 men continuously, and now that the business is stopped, they and their families are thrown on the streets to beg for bread.

How long this state of affairs may last is hard to say, but we understand the government has decided to open up some sort of relief work whereby the natives, at least, may earn a little money. A great many British subjects have been granted free passage by the government, and have returned to British Guiana,

of balata which cannot be shipped away. In the end many bleeders have also thousands of pounds stowed away. To bring it into town would be useless; it cannot be sold, not even at 25 American cents per pound. The large companies, with head offices in Holland, cannot obtain money to finance their enterprises; dissatisfaction prevails, and a general smash-up stares the balata industry in the face. Although Dutch Guiana is situated thousands of miles away from the seat of war, the distress and stagnation of business is most alarming.

We predicted in previous correspondence that 1914 would be a record production year, and, although unforeseen circumstances have since taken place, the production from January to August 31 reached 600,000 kilograms. At the outbreak of the war the production for the year stood at 482,363 kilograms, when the season was at its height. All operations have been suddenly stopped, and the bleeders taken off the grants. Had circumstances been normal our prediction would certainly have been fulfilled. It was anticipated in balata circles at Paramaribo that the United States market would have taken the bulk of the production. Owing to the European ports being closed the prices quoted in New York were so ridiculously low that the exportation of all balata was naturally checked, and in consequence the markets of Dutch Guiana are overstocked with the product. We think American manufacturers would do well to try the Surinam product at this time; we are convinced good bargains are easily obtained, especially when ready cash is in such great demand in the colony.

The new regulation governing the industry passed its final reading in the local parliament, and is now law. It certainly is most unfortunate that just as these new laws came into force the European war should break out and the whole business be shelved for an indefinite period. There is no capital to invest in large tracts, and cessation is the order of the day on all balata undertakings.

Enterprising Americans can now buy all the balata they require, and pile it up against the advent of high prices. With a fair amount of ready cash on hand several hundred tons of sheet could be purchased at ridiculously low figures.

BRAZILIAN NOTES.

At a recent session of the Brazilian Chamber of Deputies, a credit of \$100,000 was voted for the preliminary surveys connected with the Santa Catharina Railway. The sum of \$450,000 was likewise approved for the removal of obstructions from the rivers Acaqui, Guapy and Guasimbola.

Brazilian imports for the first half of 1913 equaled \$205,419,960, while those for the corresponding period of this year only represented \$134,385,085.

Export statistics for the same period of the two years showed, respectively, the equivalents of \$158,038,030 and \$153,873,190.

The Brazilian press calls attention to the balance of international trade being in favor of Brazil, for the first six months of 1914.

Following up previous announcements, De Lagotellerie & Co. have given notice of the temporary closing of their Para office, as a result of the European complications. They request that all communications be addressed to Caixa Postal, 31a Manaus.

The British consul at Rio was lately advised by cable that his Government had sent three warships to the Gulf of Mexico for the protection of cotton and kerosene cargoes.

In consequence of changes in administration, twenty-two members of the staff of the Madeira-Mamoré Railway lately returned to the United States.

Brazilian statistics show the rubber exports for the first half of 1914 to have represented 66,225,308 paper milreis (\$22,075,102), as compared with 99,977,497 milreis (\$33,325,832) for the corresponding period of 1913.

IN THE FOREST AMONG THE BALATA TREES, SURINAM.

where conditions are said to be better. Great fear is entertained that should the war last very much longer the balata industry will be entirely ruined. The warehouses of the various concessionaries in Paramaribo are stocked with thousands of pounds

A New Form of Testing Device for Rubber.

IN 1912 the French Society for Encouragement of the National Industry of France entered on MM. C. Cheveneau and E. Heim a gold medal for the invention of a registering dynamometer for testing rubber samples.

This machine, as can be seen by the illustration No. 1, shown herewith, resembles the Schopper machine very closely, but has a self-registering device, P, attached to the arm which carries the weight that swings on a fulcrum, O. By means of a gear at O' the cylinder revolves as the weight is raised. By means of the rack and pinion V, which revolves a smaller pinion connected with the chain beside the cylinder, and which chain carries a pencil, a line is registered on the cylinder. The height of the line

FIG. No. 1.

represents the stretch, and the distance of revolution shows the weight or pull.

A great amount of complicated calculation has been given to show the correctness of the registration. This is characteristic of many continental scientists, who would rather make a complicated calculation than a simple trial which would give a calibration, allowing for the numerous errors of the calculation and compensating for any friction or weight of the cylinder or moving machinery.

At the International Rubber Congress held in London in 1911, MM. Cheveneau and Heim gave an elaborate set of tables of the tests made on this machine, but did not describe the machine. It has not hitherto been illustrated, though it appears to have merit. A criticism of the machine and of its system of operating has since appeared in France (*Le Caoutchouc et la Gutta Percha*; July 15, 1914, page 8430), in which exception is taken to the formulas and method of calculation. The anonymous author suggests that instead of the foregoing apparatus, one be used which is shown diagrammatically in figure No. 2.

Here it will be seen that the pendulum P swings on the center o, around which a cord extends to the sample a held between the nippers. Attached to the nippers or holders are two pulleys around which a cord is stretched attached to base at one end at f, passing over pulleys at top and around wheel on end of registering cylinder and finally ending in weight g. Now as the specimen stretches in the jaws it is evident that the weight g must rise to twice the extent of the stretching of the sample. The movement of the sample a caused by the swing of pendulum or

weight P will not have any effect on the length of this cord which revolves the cylinder. Nor does the weight of g or friction of pulleys have any influence, as this pull is transferred to the weight g through the grips on the sample a.

The recording pen is moved by the bar d, connected with plate c, which follows out the extended end of pendulum at b, thus following the movements of the weight and recording it. The weight c pulls the pencil out through a rack and pinion on the bar d and the weight pulley. It appears that the pencil might be moved by simple attachment of cord from it to wheel on center o, or attached to ball c with the same effect. A simpler way would be to have the recording cylinder attached to center o and revolving with it. It would be easy to so rearrange the cord between f and g as to move the pencil instead of revolving the cylinder,

FIG. No. 2.

which would, of course, revolve with the shifting of weight P.

It is hoped that the above account of what has been done may stimulate those who have the standard non-recording machines of the same to attach a recording device such as an indicator card cylinder machine like those used on steam engines. Of course, rather than go into elaborate calculations, it is better to merely calibrate by attaching standard weights or a series of them in place of the sample a and noting the points at which definite weights move the machine and the indicator cylinder. Of course with this indicator or self-registering device hysteresis could be determined, as well as total strength, etc.

The fullest data relating to the machine and experiments with it may be found in the "*Bulletin de la Société D'Encouragement pour l'Industrie Nationale*" Paris; Vol. 120, 113th year, No. 1, p. 20, July, 1913.

AMERICAN RUBBER BOOTS FOR THE ALLIES.

Rubber boots of course come under the classification of contraband of war, but inasmuch as the ocean steamers plying between English and American ports are not likely under present conditions to be seriously disturbed, some American manufacturers of footwear have evidently thought it quite safe to ship rubber boots for the use of the allied armies. Fourteen hundred cases—about 17,000 pairs—of short boots were shipped from Boston on the "*Scythian*," sailing September 24, an additional shipment of 10,000 pairs being made on the "*Arabic*," sailing from the same port October 6, and a like shipment leaving the next day also from the same port on the "*Bohemian*." These shipments are probably only the beginning of a large order for army use in the great European combat.

 1,110,674. Catamenial appliance. J. B. Des Rosiers, Providence, R. I.
 1,110,730. Rubber heel. J. G. Tuftord, assignor of one-sixth to C. H. Trayer, one-sixth to A. G. Smith, and one-twelfth to W. C. Smith, all of Parma, Ohio.
 1,110,750. Resilient tire for motor cars and other vehicles. H. Diamant, Middlesex, England.
 1,110,800. Machine for inserting wires in the rim engaging portion of solid tires. C. Kuentzel, assignor to the Goodyear Tire & Rubber Co., both of Akron, Ohio.
 1,110,916. Auto tire saving device. C. J. Fisk and E. Lindblom both of Bismarck, N. D.
 1,110,956. Artificial hat. W. F. McBride, Warsaw, Ind.
 1,110,959. Bath tub silencer. G. A. Niewiadowski, Cleveland, Ohio.

Designs.

- 46,408. Bathing cap. J. A. Murray, assignor to The Seamless Rubber Co., both of New Haven, Conn.
 46,409. Bathing cap. J. A. Murray, assignor to The Seamless Rubber Co., both of New Haven, Conn.
 46,410. Bathing cap. J. A. Murray, assignor to The Seamless Rubber Co., both of New Haven, Conn.

Trade Mark.

- 78,876. The Master Car Builders' Association, Chicago, Ill. The initials *MCB*. For rubber hose.

ISSUED SEPTEMBER 22, 1914.

- 1,111,010. Life preserver. J. Depta, Passaic, N. J.
 1,111,094. Bath tub appliance comprising a pneumatic cushion. F. C. Rehm, assignor of one-half to C. Nelson—both of Detroit, Mich.
 1,111,095. Tire protector. A. Riemann, New York, N. Y.
 1,111,145. Vehicle wheel. E. J. Fillingim, Pace, Fla.
 1,111,149. Penholder for multicolor writing. L. B. Halverson, Flandreau, S. D.
 1,111,170. Skiving machine. E. Nall and W. C. Tyler, assignors to The Goodyear Tire & Rubber Co.—all of Akron, Ohio.
 1,111,171. Resilient vehicle tire. W. M. Nevotti, Omaha, Neb.
 1,111,188. Overshoe. J. T. Simpson, Chicago, Ill.
 1,111,204. Spring wheel. A. W. Yeungkvist, assignor to Easy Auto Wheel Co.—both of Duluth, Minn.
 1,111,232. Method of and machine for folding the edges of rubber sheets. J. E. Perrault, Belmont, assignor to Hood Rubber Co., Watertown—both in Massachusetts.
 1,111,317. Shoe last with cavity having filling of resilient material. J. Pacelli, New York, N. Y.
 1,111,404. Protector for tires. C. A. Pettie, New York, N. Y.
 1,111,418. Manufacture of vehicle tires. F. L. O. Wadsworth, Sewickley, Pa.
 1,111,419. Construction of vehicle tires. F. L. O. Wadsworth, Sewickley, Pa.
 1,111,423. Demountable rim for vehicle wheels. J. L. Webster, Chicago, Ill.
 1,111,436. Shoe sole vulcanizing and applying apparatus. G. F. Butterfield, assignor to G. I. Butterfield—both of Cambridge, Mass.
 1,111,437. Composite boot and shoe. G. F. Butterfield, assignor to G. I. Butterfield—both of West Newton, Mass.
 1,111,519. Fountain pen. F. M. Ashley, New York, N. Y.
 1,111,642. Toy balloon. F. F. Brucker, assignor to The Miller Rubber Co.—both of Akron, Ohio.
 1,111,643. Rubber backed brush for applying polish. L. W. Ballard, Cumberland, Md.

Designs.

- 46,428. Vehicle tire. J. Christy, Akron, Ohio.
 46,434. Vehicle tire. R. J. Marshall, assignor to The Morgan and Marshall Rubber & Tire Co.—both of East Liverpool, Ohio.
 46,447. Pneumatic tire. T. R. Palmer, Erie, Pa.

Trade Marks.

- 7,952 Resistol Process Co., Chicago, Ill. The word *Resistol*. For waterproof fabrics, waterproof sheeting, etc.
 7,928 H. W. Johns-Manville Co., New York, N. Y. The initials *J-M*. For rubber belting, hose, etc.
 7,854 Paxton & Gallagher Co., Omaha, Neb. The word *Monitor*. For outboard motors, inner tubes, boots, etc.

ISSUED SEPTEMBER 29, 1914.

- 1,111,802 Method of forming patches for rubber articles. J. G. Moomy, Erie, Pa.
 1,111,803 Method of forming patches for rubber articles. J. G. Moomy, Erie, Pa.
 1,111,804 Patching rubber articles and process of manufacture. J. G. Moomy, Erie, Pa.
 1,111,807 Spring wheel. F. M. Ross and H. G. Horstman, assignors of one fourth to W. W. Baxter and one fourth to T. Horstman—all of Cincinnati, Ohio.
 1,111,887 Spring wheel. J. S. Culp, Elkhart, Ind.
 1,111,903 Apparatus for pneumatic tires. R. C. Purvis, Seaford, Del.
 1,111,907 Vulcanizing apparatus. A. G. Anderson, Chicago, Ill.
 1,111,914 Exercising apparatus. R. J. R. Caines, Boston, Mass.
 1,111,916 Resilient wheel. A. Cane, Oakland, Cal.
 1,111,967 Sanitary entomological garment. J. G. Kovira, New York, N. Y.
 1,111,968 Surgical irrigating apparatus. L. J. Stilling, Newark, N. J.
 1,111,201 Shoulder support for personal wear comprising inflatable bulbous elastic cushions. F. W. Ersfeld, New York, N. Y.
 1,111,48 Woman's reversible and adjustable house dress having a belt comprising telescoped elastic and inelastic portions. W. C. P. Baldwin, Holyoke, Mass.
 1,111,85 Spring wheel. H. S. Gover, Bel Air, Md.
 1,111,896 Spring wheel. O. F. Miller, New Milford, Pa.
 1,111,896 Curing machine. C. H. Roper, Belmont, assignor to Hood Rubber Co., Watertown, both in Massachusetts.
 1,111,353 Tire protector. V. L. Bowman, Oakland, Cal.
 1,111,362 Fountain pen feed bat. D. C. Demarest, Passaic, N. J.

Design.

- 1,111,802 Design. J. R. McKenna, East Palestine, Ohio.

Trade Mark.

- 7,952 H. B. Klumpp Rubber Co., New York, N. Y. The word *Tango*. For dress shields.

NOTE.—Printed copies of specifications of United States patents may be obtained from the India Rubber World office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

1,111,807 given to that assigned to the Patent at the filing of the application in the case of these listed below was in 1913.

*Don'ts Patents for American Inventions.

- 1,111,807 [THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 2, 1914.]
 1,111,807 Vehicle wheel rim. C. F. Walker, Blackian Tannery, St. James Road, Northampton.
 1,111,808 Detachable rim attachments to wheels. W. D. D. Jones, 18, College street, Lambeth, London.
 1,111,809 Spring for wearing apparel. K. Gosman, 17, Kluserstrasse, Elberfeld, Germany.
 1,111,810 Tire tread consisting of a rubber or similar upper surface and a sheet metal foundation. C. L. Githber, 27, Great Eastern street, London.
 1,111,811 Patching patches. J. G. Moomy, 33 East Eleventh street, Erie, Pa., U. S. A.
 1,111,812 Spring wheel. J. A. Roach and S. A. Gouard, Seminary street, St. John, Ontario, Canada.
 1,111,813 Spring wheel with continuous elastic tire. O. H. Hinds, 10, Fairbank street, Los Angeles, Cal., U. S. A.
 1,111,814 Curing machine. D. K. Koe, 435 Riverside Drive, New York, N. Y., U. S. A.
 1,111,815 Curing machine. A. Palouze, 94, Boulevard Carl Vogt, Geneva, Switzerland.
 1,111,816 Tire protector. V. L. Bowman, 77, Rue DeFaqz, London.
 1,111,817 Design. P. A. N. Smith, 1, Beccas Buildings, 1, Beccas Buildings, London.
 1,111,818 [THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 9, 1914.]
 1,111,818 Vulcanizing device. F. L. B. B. dell, 4, West Kensington, London.
 1,111,819 Exercising apparatus. D. K. Koe, 435, River-side Drive, New York, N. Y., U. S. A.
 1,111,820 Instrument for curing tires. T. T. Smith, 1, Erie, Pa., U. S. A.
 1,111,821 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,822 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,823 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,824 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,825 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,826 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,827 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,828 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,829 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,830 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,831 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,832 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,833 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,834 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,835 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,836 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,837 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,838 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,839 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,840 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,841 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,842 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,843 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,844 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,845 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,846 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,847 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,848 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,849 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,850 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,851 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,852 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,853 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,854 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,855 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,856 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,857 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,858 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,859 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,860 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,861 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,862 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,863 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,864 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,865 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,866 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,867 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,868 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,869 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,870 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,871 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,872 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,873 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,874 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,875 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,876 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,877 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,878 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,879 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,880 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,881 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,882 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,883 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,884 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,885 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,886 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,887 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,888 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,889 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,890 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,891 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,892 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,893 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,894 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,895 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,896 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,897 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,898 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,899 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.
 1,111,900 Tire comprising one or more rings of Spanish cane seated in a rubber bed. F. Zatl and J. Zatl, Olm, Post Alton, Norderdamm, Germany.

- 1,111,885 (1913). Tire attachment to rim. C. T. B. Sangster, Dale Road, Bournbrook, Birmingham.
 1,111,886 (1913). Vulcanizing rubber. Farbenfabriken vorm. F. Bayer & Co., Leverkusen, near Cologne, Germany.
 *1,111,887 (1913). Pressure gage for pneumatic tires, etc. J. B. Polo, Clear Lake, S. D., U. S. A.
 1,111,888 (1913). Vulcanizing india rubber. Farbenfabriken vorm. F. Bayer & Co., Leverkusen, near Cologne, Germany.
 1,111,889 (1913). Cushion. R. G. Cope, Bradford House, Bloxwich, Staffordshire.

ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 16, 1914.]

- *1,111,890 (1913). Life buoy. J. J. Puskanen, Chisholm, Minn., U. S. A.
 1,111,891 (1913). Rubber and leather insoles and soles. Soc. Francaise du cuir Anne, 118, Rue de Valenciennes, Paris.
 1,111,892 (1913). Spring wheel. B. B. Roberts, Park House, Cimla, and J. Walters, Maesgwyn, Groll Park Road—both in Neath, Glamorganshire.
 1,111,893 (1913). Spring wheel. S. P. Neuhausen, 3934 North Francisco avenue, Chicago, Ill., U. S. A.
 1,111,894 (1913). Coating metals. J. Troncl, 6, Leijzigerstrasse, Berlin.

- 13,390 (1913) Wheel tire tread band. J. Scott, Cycle Works Market Place, Wether, Northumberland.
- 13,430 (1913) Waterproof material for protecting passengers and tops of vehicles. B. S. Kennell, 31, Chester Buildings, Diamond Grove, Camberwell, and C. H. Workman, 60, Aberlure Gardens, South Hampstead, both in London.
- 13,438 (1913) Treating latex. S. C. Davidson, Sirocco Engineering Works, Belfast.
- 13,444 (1913) Floats of gas tight fabric impregnated with rubber, for raising sunken ships. L. Vincina, 8, Via Gaspara Stampa, Trieste, Austria.
- 13,451 (1913) Molding rubber articles. J. T. Brierley, "Highfield," and Leyland & Birmingham Rubber Co., Golden Hill Works, both in Leyland, Lancashire.

NEW ZEALAND.

- [ABSTRACTED IN THE PATENT OFFICE JOURNAL, JULY 30, 1914.]
- 31,840 (1913) Resilient wheel with pneumatic rotating cushions. R. F. P. Patent Wheels Proprietary, Ltd., of Tuckett Chambers, 359 Collins street, Melbourne, Victoria.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 469,415 (March 9, 1914). Rubber heel for footwear. A. Guénès.
- 469,498 (March 11). Press for joining the soles to footwear by the help of an agglutinant. Continental Caoutchouc & Gutta Percha Co.
- 469,536 (March 20). Mudguard for automobiles and other vehicles. E. Emery.
- 469,780 (May 28, 1913). Elastic cover for wheels of automobiles and other vehicles. G. G. Chapelet.
- 469,933 (March 24, 1914). Process for making air chambers for pneumatic tires. R. T. Henderson.
- 470,019 (June 5, 1913). Non-pneumatic elastic tire for vehicle wheels. E. G. Ort.
- 470,020 (June 5). Improvements in tire rims, applicable to wheels of vehicles in use. J. L. Gommeret.
- 470,089 (March 25, 1914). System of tires for cycles. M. Regnier.
- 470,065 (March 26). Protection for pneumatic tires. Herkules Pneumatik-Werke, G. m. b. H.
- 470,078 (June 6, 1913). Process, ensuring the protection and resistance of natural or artificial rubber, pure or mixed, and of similar products. Madame Eve Marnette.
- 470,090 (January 12, 1914). Elastic wheel for automobile and other vehicles. M. S. de Camille.
- 470,133 (March 16). Process of manufacture of all kinds of rubber tires. H. Wipfel and The Rubber Pneumatic Tire Co.
- 470,135 (March 16). Pneumatic tire for motor cars. C. Herrmann.
- 470,179 (March 18). Method of joining rubber tires. A. Gouze and M. L. Roubil.
- 470,181 (March 25). Vehicle wheel for automobile. A. Bourreau.
- 470,167 (March 26). Improvements in tire cushions. Madame M. M. L.
- 470,180 (June 12, 1913). Vehicle wheel with elastic tire. H. Eblert.
- 470,162 (March 18, 1914). Improvements in non-inflating pneumatic tires. F. Nothmann and L. Eblert.
- 470,187 (April 16). New rubber substitute for waterproofing and similar operations, and process for its manufacture. G. d'Almeida.
- 470,177 (March 30). Process for preparing a material for hollow printing, by using sensitive layers of like and unlike substances for the one part, and bitumen and like substances for the other part. J. Richter.
- 470,446 (April 20). Mudguard tire cushion intended for wheels of heavy weight vehicles. A. Eulert.

[NOTE: Printed copies of specifications of French patents can be obtained from R. Bolet, Ingenieur Conseil, 16 avenue de Villiers, Paris, at 50 cents each postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

- 778,351, Class 471 (September 24, 1913). Apparatus for attaching repair patches to the inner walls of hose. Leopold Piehl, Trebnitz, Silesia.
- 778,430, Class 30d (January 3, 1914). Bandage for ruptures. Heinrich Carl H. Bandagen Fabrik, Lahr, Baden.

- 78,564, Class 63 (June 1, 1913). S. rollers with air chambers for motor truck wheels. On. Schlegel, Berlin Pankow.
- 78,606, Class 30g (September 24, 1913). Nursing bottle. Wilhelm Dettmer and Jean Bruner, Cologne.
- 78,688, Class 471 (February 2, 1914). Vacuum container for compressed air tanks. Gottlieb Auerbach, Esslingen.
- 78,824, Class 39b (April 14, 1913). Improvement of insufficiently polymerized rubber material. The B. F. Goodrich Co., New York.
- 78,975, Class 471 (December 5, 1913). Self-stuffing box packing. A. Galen, Leiden-dorff & Co., Mulheim-Rh.

INDIA RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of values of exports of manufactures of india rubber and gutta percha for the months of July and August, 1914, and for the first eight months of five calendar years.

MONTHS.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	TOTAL.
July, 1914	\$188,774	\$103,862	\$686,645	\$979,281
August, 1914	128,958	42,941	343,073	514,972
January-June	1,118,298	415,672	3,680,007	5,213,977
Eight months, 1914	\$1,436,030	\$562,475	\$4,709,725	\$6,708,230
Eight months, 1913	1,680,443	856,050	5,865,815	8,402,308
Eight months, 1912	1,650,887	850,879	5,356,274	7,858,040
Eight months, 1911	1,482,052	1,175,597	4,815,708	7,473,357
Eight months, 1910	1,431,382	1,347,749	3,798,848	6,577,979

The above heading, "All Other Rubber," for the months of July and August, 1914, and for the first eight months of three calendar years, includes the following details relating to tires:

MONTHS.	For Automobiles.	All Other.	TOTAL.
July, 1914	\$341,617	\$36,279	\$377,896
August, 1914	188,002	33,063	221,065
January-June	1,760,475	259,873	2,020,348
Eight months, 1914	\$2,290,094	\$329,215	\$2,619,309
Eight months, 1913	2,922,200	387,515	3,309,715
Eight months, 1912	2,240,826	393,441	2,634,267

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, circulation, etc., required by the Act of August 24, 1912, of THE INDIA RUBBER WORLD, published monthly at New York, N. Y., for October 1, 1914.

Editor, Henry C. Pearson, Tompkins Corners, Putnam Co., New York.

Managing Editor, John P. Lyons, 201 West 105th street, New York.

Business manager, Henry C. Pearson, Tompkins Corners, Putnam Co., New York.

Publishers, The India Rubber Publishing Co., 25 West Forty-fifth street, New York.

Owner, Henry C. Pearson, Tompkins Corners, Putnam Co., New York.

Known bondholders, mortgagees, and other security holders, holding 1 per cent. or more of total amount of bonds, mortgages, or other securities: None.

(Signed) JOHN P. LYONS, Managing Editor.

Sworn to and subscribed before me this first day of October, 1914.

(Signed) HELEN HEROLD, Notary Public,

New York County No. 1723.

[Seal]

New York County register No. 5202. Certificate filed in Kings County Register's office No. 6679. (Term expires March 30, 1915.)

BALLOONS IN WARFARE.

The first balloon used in warfare was that which, on September 23, 1870, ascended from Paris, piloted by the aeronaut Durouf, with 250 pounds of letters, and after three hours' flight descended at Evreux, beyond the lines of the besieging Prussians. Sixty-five balloons, each costing about \$1,000, were similarly despatched from Paris during that siege, carrying from 200 to 1,000 pounds of letters each. All such letters were written on very thin paper, the reverse side having printed on it news of the besieged city.

Review of the Crude Rubber Market.

New York, October 30, 1914.

THE principal feature of the New York hard line Pará market during the month of October was its relative steadiness.

On September 30 it stood at 65/66 cents; rising on October 1 to 66 1/2 cents and dropping again on the 7th to 64/65 cents. It remained at this price till the 21st, when it rose to 66 cents, at which point it stood on the 30th.

Firmness marked the early days of the month, but manufacturers showed no disposition to anticipate supplies to an important extent. A good demand from tire making concerns was, however, noted from the West. One important concern was reported to be operating to 80 per cent. of its capacity.

Towards the middle of the month the improved export trade in rubber goods and other demands had reacted beneficially on the tone of the rubber market, price-cutting having almost entirely disappeared. Some of the leading grades of Pará rubber sold at an advance of 1 cent on the price of a week earlier. The closing week of the month displayed increased firmness.

Plantation rubber likewise remained steady during the greater part of the month, on the basis of 58/60 cents for pale crepe; advancing on the 22nd to 61 cents, at which it stood on the 30th.

Arrivals of plantation rubber were extensive, but were understood to be largely in execution of contracts.

The latest advices from London report a firm market at recent quotations, there being no pressure to sell. London imports for the month of September included 3,523 tons plantation, while deliveries represented 3,452 tons. Stocks of plantation aggregated 3,303 tons on September 30, 1913, and 3,595 tons on the same date this year. Deliveries were thus nearly keeping pace with imports, receipts having been fairly well disposed of.

Owing to the accumulation in London of brown, specky and dark qualities of plantation, low prices have been current there for these grades.

An estimate quoted by Consul General L. Drier, of Singapore, places the aggregate output of the Straits Settlements and the Federated Malay States for 1914 as about 69,326,269 pounds, the total for the first 6 months of this year being 34,510,939 pounds. There is no longer fear of a shortage, two steamers having alone brought between them 2,100 tons to London. Stocks are reported to be steadily diminishing. According to the most recent advices, no date has been fixed for the resumption of auctions.

By latest reports, large quantities of rubber are being shipped from New York by the principal dealers. The quantity for October has been estimated as 200 to 300 tons for Norway, Sweden, Denmark, Holland and Italy. Though it has been supposed that some of this rubber may have been ultimately intended for Germany, it is generally believed that the bulk of it is meant for consumption in the countries to which it is shipped.

The Norwegian manufacturing industry is obliged to undertake the manufacture of boots and shoes for the home trade, seeing that the supply from Russia is cut off. On account of this development the purchases of crude rubber by Norwegian manufacturers are unprecedentedly large.

The strength of the New York market for plantation rubber has been partially attributed to sinking of the steamer "Troilus" in the Indian Ocean, with 1,200 tons of crude rubber, by a German cruiser, and other losses from the same cause.

Crop returns for nine months, to end of September, as cabled, included the following:

	1913,	1914,
Anglo Malay	Pounds 974,375	1,016,571
Pataling	366,111	418,706
London Asiatic	722,394	794,295
Golden Hope	129,658	116,530
Selaba	304,399	391,222
Rubber Estates of Johore	200,159	378,275

Production by the larger plantations is evidently being kept up.

The Antwerp rubber market has been transferred to London, and the additional supplies have materially contributed to supplying needs. A strong demand has been noticeable from Russia.

Satisfaction has been expressed at the manner in which the English market has so far surmounted the difficulties anticipated at the opening of hostilities. Receipts are fully up to expectations. Importers are therefore obliged to meet the market.

NEW YORK QUOTATIONS.

Following are the quotations at New York one year ago, one month ago, and October 30, the current date:

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows. "The first half of October the market for commercial paper remained about the same as during August and September, the demand being very light and rates ruling anywhere from 7 1/2 to 9 per cent. for various rubber names, but the latter part of the month the situation improved considerably and the demand for paper increased, and some of the best names went as low as 6a 6 1/2 per cent., and those not so well known 7a 7 1/2 per cent."

Plantation Rubber from the Far East.

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1, to September 14, 1913 and 1914. Compiled by the Ceylon Chamber of Commerce.)

To—	1913.	1914.
Great Britain	8,809,508	11,947,217
United States	4,352,644	5,886,037
Belgium	2,478,057	2,969,369
Australia	367,309	482,674
Germany	176,626	1,037,417
Japan	170,889	215,100
Straits Settlements	48,343	42,535
Italy	38,828	1,772
Austria	29,335
France	4,482	259,672
Holland	992
India	881	1,050
Russia	105,212
Total	16,477,894	22,948,053

(Same period 1912—8,240,392; same period, 1911—3,686,862.)

The export figures of rubber given in the above table include the imports re-exported. (These amount to 2,711,816 pounds 2,174,979 pounds from the Straits, and 525,213 pounds from India.) To arrive at the approximate quantity of Ceylon rubber exported to date, deduct the quantity of imports shown in the import table from the total exports.

TOTAL EXPORTS FROM MALAYA.

(From January 1 to dates named. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

To—	Singapore.	Malacca.	Penang.	Port Swet	Total

THE RUBBER SCRAP MARKET.

At the beginning of the month of October dealers were operating to a fairly large extent in boots and shoes at 6½ to 6¾ cents. Mills were not large purchasers, but were paying 7 cents for their requirements, while in some cases they paid 7½; some sales being reported even at 7¼ cents under special circumstances.

By the middle of the month a somewhat better tone prevailed, large dealers being willing to give about 6¾ cents, and the business with mills being done at 7½ to 7¾ cents. Some dealers claimed to have been able to buy under 6½ cents, but any such transactions did not affect the market generally.

Towards the close of the month a slightly less active tone prevailed; mills offering only 7 cents, but being obliged in some cases to pay 7¼ cents. Some dealers, who were desirous of reducing stock, sold at 7 cents.

Auto. tires were weak at the opening of the month, buyers only operating to a limited extent, but paying 4½ cents. Dealers were not disposed to pay over 4¼ cents. Later in the month, mixed lots of tires were sold by dealers at 4½ to 4¾ cents, while reclaimers needing a special grade were disposed to pay good prices. Dealers could not purchase tires at prices allowing of sales under 4½ cents. In the closing week they were able to buy at 4½ cents.

Sales of inner tubes between dealers were effected, it is said, for No. 1 at 20 cents, while the best price consumers were willing to pay was 22 to 23 cents. For No. 2 dealers were not disposed to offer more than 10½ to 11 cents. For boots and shoes large Philadelphia dealers are offering to collectors 6½ and selling to reclaimers at 7 cents. The prices offered for mechanical rubber scrap have been speculative, owing to uncertainty as to disposal of the merchandise.

At Boston dealers obtained for boots and shoes from 7 to 7¼ cents, paying 6½ to 6¾ cents. Auto, tires and inner tubes are depressed, owing to lack of demand.

The Leicester Rubber Co., of Catasauqua, Pennsylvania, has been petitioned into bankruptcy, with liabilities of \$49,716 and assets of \$28,560. This company, which purchased cheaper grades of scrap rubber, was formerly located at Trenton, New Jersey, moving to Catasauqua about a year ago. Its plant was destroyed by fire on July 19.

FORMER JUNK CLASSIFICATION RESTORED

The National Association of Waste Material Dealers has been instrumental in the restoration of the railroad classification of junk. New provisions will be incorporated in classification No. 53, which will deal with scrap rubber, including worn out rubber tires. Much appreciation has been expressed of the efforts so successfully made by the Western Traffic Committee of the above association, in the interest of the trade, for revisions of classifications and rates. The committee includes Albert Birkenstein, of S. Birkenstein & Sons, Chicago, and Ed. Friedlander, of the Loewenthal Co.'s Chicago office.

The committee appointed by the National Association of Waste Material Dealers met at Chicago on October 8, to discuss recommendations to be made to the Felt Makers' Association. These will be dealt with at the next meeting of the felt manufacturers. Messrs. Louis and Milton Birkenstein, of S. Birkenstein & Sons; S. Kahn, of M. Kaufman, and Milton Loewenthal, of the Loewenthal Co., formed the committee.

PANAMA SCRAP HOSE.

A further sale of scrap hose by the Panama Canal Commission took place on October 19, when the following were among the successful bidders: S. Birkenstein & Sons, 10,151 lbs. air and signal hose, 291c.; H. Muehlstein & Co., 19,551 lbs. steam, water and pneumatic hose, 45c. per cwt.; The Loewenthal Co., 8,611 lbs. fire and washout hose, etc., 1.87½c.; Atlantic Manufacturing Co., Wilmington, 4,332 lbs. sleeves, 1½c.; Oppenheimer & Co., 18,819 lbs. armored and wire-inserted hose, 20c., and The Loewenthal Co., 9,100 lbs. suction hose, 30c.

Complaints have been received of Chinese rubber shoes having been offered to members of the waste trade at the regular prices current for American shoes. As the value of these Chinese shoes is understood to be about 1c. per pound, cautious investigation is recommended of any such offers.

The incorporation has been announced of B. Levi & Co., waste material dealers, at Scranton, Pennsylvania, with a capital stock of \$20,000. It is stated that the incorporators are David Levi, Rica Levi and L. L. J. Levi.

REAR SIGNAL IN TURNING OR STOPPING AUTOMOBILES.

The old-time method of stretching out the hand to indicate that the driver of an automobile is about to turn in one direction or the other or to stop his car is likely to be displaced by an automatic rear signal lamp, as shown in the cut herewith. This lamp consists of three small bulbs mounted in a black finished aluminium base, each unit being made up of a vulcanized rubber socket containing a specially made tungsten bulb and reflector. These bulbs are said to consume only about one-third the amount of current needed for the standard lighting equipment and may be operated on dry batteries if desired. The signals are operated by self-contained waterproof contact devices attached to the steering gear and clutch pedal. The turning of the steering wheel to the right or left automatically moves an arrow in the corresponding lamp, indicating in which direction the car will proceed, and the throwing out of the clutch which precedes stopping causes the word "Stop" to appear in red letters in the center lamp. [H. W. Johns-Manville Co., New York.]

ENGLISH INQUIRY FOR CARBON TETRA-CHLORIDE.

In an inquiry which recently appeared in an English publication for carbon tetra-chloride this statement was made: "Up to the present time we understand that the manufacture of this commodity has been exclusively confined to Germany."

As a matter of fact there has been a flourishing American industry in this line for more than ten years. It is a by-product of the electrolytic decomposition of salt, which is a large industry in this country.

BATAVIA RUBBER EXHIBITION

The "Ceylon Observer" of September 4 states that on September 3 a telegram was received by Kelway Bamber in that city from the Commissioner-General of the Batavia Rubber Exhibition, which said: "Opening 19th October."

Crude Rubber and Compounding Ingredients

A TEXT BOOK OF RUBBER MANUFACTURE

By **HENRY C. PEARSON**

Editor of *The India Rubber World*

TABLE OF CONTENTS

[With Condensed Titles of Chapters.]

- I.—Grades of Crude Rubber; Physical Characteristics.
- II.—Some Little Known Rubbers and Pseudo Gums.
- III.—Primary Processes—Washing, Mixing and Calendering.
- IV.—Vulcanizing Ingredients and Processes.
- V.—Ingredients used in Dry Mixing in Rubber Compounds.
- VI.—Substitutes for India-rubber and Gutta-percha.
- VII.—Reclaimed Rubber and Its Uses.
- VIII.—Resins, Balsams, and Waxes used in Compounding.
- IX.—Coloring Matters.
- X.—Acids, Alkalis, and Their Derivatives.
- XI.—Vegetable, Mineral, and Animal Oils.
- XII.—Solvents used in India-rubber Proofing and Cementing and in Commercial Cements.
- XIII.—Miscellaneous Processes and Compounds, including Waterproofing Compounds.
- XIV.—Physical Tests and Methods of Analysis of Crude Rubber and Vulcanized Rubber.
- XV.—Gutta-percha.

[A Pamphlet containing the Comprehensive Index of this Volume will be Sent Free on Application.]

THE TEST THAT TELLS

Ten or Fifteen years' continuous service without interruption for repairs has often been obtained with Bristol Recording Instruments. The unique simplicity of construction of

RECORDING INSTRUMENTS

is responsible for their great durability and reliability in long continued service.

Take the case of Bristol Recording Gauge, Model 10, Serial No. 4038, which was shipped August 25th, 1900, and never returned for repairs until December 1st, 1913, when this recorder was found to be in fine working order except for replacement of the inking pen.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE NEW FEDERAL RESERVE BANKING SYSTEM.**

THE Federal Reserve banking system which, after many months of preparatory work, was put into operation November 16, marks the greatest change in our financial methods since the establishment of the National bank system over fifty years ago. Briefly, this new banking scheme will substitute commercial credits in the place of government bonds as a basis for bank issues. The old system now being displaced was exceedingly inelastic; under it there was too little currency when it was most needed and too much when it was not necessary. It is confidently believed by financiers generally that the new method will prove a remedy for this condition. When business is active the new reserve notes will be issued against sound commercial credits, and when business activity subsides and credit is no longer needed in the same volume, these bank notes will be deposited in the bank and retired.

It is believed that under this new system of banking the annual stringency caused by the necessity of funds for moving the western crops will be avoided and, better than

that, that the panics which have recurred from time to time, and which have played such havoc with American business, will be averted.

The new system will not provide funds for building operations, for enlargement and equipment of factories, but will simply be supplied to those who are handling commodities which can easily and immediately be converted into cash.

One feature of the new Reserve Bank system which will be of particular interest to those engaged in foreign trade is that part of the act which permits national banks to deal in foreign acceptances. For instance, if an American manufacturer wants to purchase material in a foreign country he arranges with a bank engaged in international operations to draw the necessary funds. The bank then stamps this draft "Accepted," thereupon becoming responsible for its payment. This acceptance, consequently, is good in any part of the world where the bank has credit. And, vice versa, if a foreigner wishes to purchase American goods he applies to the international bank in his city for a similar acceptance. This significant expansion of the financial operations of our banks, together with the establishment of branches of leading North American banks in South American cities, must greatly facilitate commerce between these two continents. No longer will there be any excuse for carrying on trade between North and South America by the circuitous and expensive European route.

ENGLAND'S RUBBER EMBARGO.

THAT there is a substratum of uneasiness on the part of American manufacturers because of the embargo is evident. Their visits to Washington and letters and telegrams to the State Department prove it. Yet there is a decided vein of optimism evident also. That England intends to stop rubber from going to Germany or Austria they believe. That a stoppage of shipments to the United States would help goes without saying. Perhaps, and probably, a bit later shipments could be resumed under such guarantees as would convince England that the United States was to be the ultimate destination. Again, with the Suez canal threatened, England may wish to stock up while she can. If the war goes on she and France will need lots of rubber for tires, ground sheets, etc. A big stock of rubber in London or Liverpool is only a common sense safeguard. Once accumulated, shipments to the United States would undoubtedly be resumed.

The view of some that England is going to effect a corner on plantation rubber and boost the price is too weird to be considered. It isn't the way she does things. Besides, the United States is too good a customer to treat in any such fashion. So taking it all in all, the confident belief is that there will be plenty of rubber and that there will not be any great increase in price.

DRY AND WET SEASON PLANTATION RUBBER.

FOR some time past an American rubber factory has been testing the tensile strength of rubber from an Eastern plantation in which it has an interest. One result has been the discovery that rubber gathered in the dry season has twenty-five per cent. more tensile strength than rubber from the same trees gathered in the wet season. If this is found to be the case generally there will in time be two added grades to plantation sorts, i. e.—Wet and Dry Season.

THE FAR EAST KNOCKING AT OUR DOORS.

UNDOUBTEDLY one strong actuating influence which has moved the English to put an embargo on the shipment of rubber from their Eastern colonies to American ports is the fear that Eastern rubber might get the habit. It is obviously to the advantage both of the Eastern planters and of American manufacturers that rubber should be shipped direct from one to the other, but it is equally obvious that this method would not be looked upon with favor by rubber circles in London.

But while direct shipments may not take place, at least from British colonies, during the war, it is quite probable that they will follow its conclusion, for the East is exceedingly anxious to get into direct touch with the largest consumer of its plantation product. Interesting light is thrown on the Eastern attitude by two letters which appear on another page in this issue. One comes from a firm of Rotterdam dealers who market the rubber from a number of Dutch estates in Java and Sumatra. They ask for information as to the best way to get in contact with American customers. They write: "We have gone so far as to suggest the idea of establishing an office in the United States for joint account of our companies to sell our product there; and we have considered the possibility that the Americans might work hand in hand with us to open a market in your country direct, instead of taking the way via England."

The other letter comes from a correspondent who has contributed before to the columns of this publication and

who has long been familiar with conditions in the East. "There is now the chance of a lifetime," he says, "for American firms to buy rubber direct here in Singapore, and to establish direct relations with the center of production. Rubber was selling here in August at 1s. to 1s. 6d. per lb.—prime smoked sheet—but no orders could be obtained from anywhere. Where were your manufacturers? If they had had agents here they would have had the chance of a lifetime to lay in stocks on the ground floor."

It is not characteristic of American manufacturers to continue the long way around when there is a short cut in plain sight, and there is not likely to be an indefinite continuance of the system by which Eastern rubber intended for New York must first go somewhere else, some distance out of its way, with no other result than that its receipt is materially delayed and its cost considerably increased.

THE RUBBER CLUB'S RELIEF FUND.

THE relief fund being raised by the Rubber Club of America for the assistance of the Red Cross work and for the succor of the Belgian victims of the war, had on November 25 reached nearly \$2,000. This sum will undoubtedly grow considerably during the present month. A more extended reference will be found on another page to the club's appeal to its members and their response. It will be noticed there that, while perhaps a majority of the members contributed to the fund the sum that would normally have been paid for attendance at the usual annual banquet, quite a good many others gave contributions far in excess of this sum—many sending in contributions of \$25, some of \$50, and some exceeding \$100. This is an excellent showing in view of the fact that appeals for the Red Cross work and for the Belgian sufferers have been made from many quarters during the last few weeks and without doubt a large number of the club members had already made substantial contributions to these causes through other channels.

ONE PITFALL THE EXPORTERS SHOULD AVOID.

THE opening door of the South American market—which will be likely to open wider with the continuance of the war—will undoubtedly attract not a few American manufacturers, and among them makers of various rubber goods. Their success in this field will be in proportion to the discretion with which it is entered.

The difficulties in the way of inaugurating profitable

trade relations with the republics to the south—difficulties in financing, in the commercial traditions and customs of the South Americans and in their national and racial differences from ourselves—have been discussed at considerable length in these columns. But there is one pitfall that has trapped unwary exporters in the past, and which will undoubtedly continue to claim still further victims, that can easily be avoided.

Under the laws of most of the South American republics a trade mark becomes the property of the man who first enters it for registry, without any regard whatever to the ownership of the goods on which the trade mark appears or the length of time it may have been in use. To illustrate,—If an American manufacturer, after a great expenditure of time and money and effort, succeeds in getting a market for his goods, let us say in Argentina, and the Argentine dealer to whom he entrusts the distribution of his merchandise—or, as a matter of fact, any other dealer—registers the trade mark, he can effectually estop the American manufacturer from marketing his goods in that country through any other agent than himself. This is not a theoretical situation, for it has occurred in a number of instances.

Once this pitfall is seen, the remedy is of course simple, namely,—that the American manufacturer, before he enters into any trade relations in any South American country, should register his trade mark in that country in his own name and avoid the anomalous and most unhappy position of being the owner of the goods but having the trade mark of these goods, and with it the absolute control of their sale, fall into alien and often hostile hands.

WHAT THE LOSERS WILL HAVE TO PAY.

WHETHER the end comes soon or late, of the most stupendous war the world has ever seen, somebody will have to pay. It is not going to end in a love feast and embraces all around. The governments and peoples in this struggle are grimly in earnest, and when the loser sits down at the council table with the plenipotentiaries of the victors he must prepare himself for some very unpalatable demands. The material losses of all contestants have been stupendous and, whatever the loser or neutrals may say, the victor will not be backward in demanding compensation.

Passing considerations of money indemnities and changes in the map of Europe, the question of interest to readers of *THE INDIA RUBBER WORLD* is what is going to be done about the colonies of the warring nations.

One thing is extremely probable. If Germany wins, she will possess every foot of Africa from the Strait of Gibraltar to the Cape of Good Hope. With England, France and Belgium she is at war. Italy must be punished for her failure to maintain the Triple Alliance and Portugal for her announced readiness to support England when called upon. This accounts for all but Spain's insignificant possessions and the little states of Liberia and Abyssinia, which would wait their turn with such equanimity as might be possible. It is not likely that Germany would care for an Indian problem just yet.

On the other hand, if Germany loses she is likely to be stripped of every foot of her possessions outside of Europe, and they would be divided, of course, between France and England. Kaiuchau, on the coast of China, which Japan lately captured from Germany, will, no doubt, be returned to its original owner, if Germany is defeated. But if the latter wins, Japan will come in for a bad quarter of an hour, in which China will share. An even more momentous question would arise for the United States if Germany should win and should demand possession of some or all of the West Indian possessions of England and France. The Monroe Doctrine would require the United States to oppose the coming of another strong European power as a neighbor. But Germany does not recognize the Monroe Doctrine and a highly interesting situation would arise.

THE INCORPORATION IN THE EASTERN STATES OF NEW companies having a capital of one million dollars or over represented for the month of September an aggregate capitalization of fifty-four million dollars. This was an increase of four million over August and of twelve million over September of a year ago, but it is materially below the average for the last three years. For the twelve months of 1912 and for the first five months of 1913 the monthly capitalization of new corporations only twice fell below the one hundred and fifty million mark, the average being well over two hundred million dollars a month. There was a marked falling off in June of 1913 and only twice since that time has the monthly aggregate exceeded one hundred million.

For the first nine months of the present year the total capitalization of new corporations of a million and over in the eastern states was six hundred and seventy-two million dollars, which is but slightly over one-half of the amount for the same period in the preceding year and not much over one-third of the aggregate for the same period in 1912. The new capitalization during the present year has averaged a little less than seventy-five million dollars per month, which, though low in comparison with recent years, is undoubtedly quite high enough to harmonize with present conditions.

Belgium and Its Rubber Trade.

HOWEVER opinions may differ among Americans in regard to the motives and merits of the great European conflict—though probably American opinions differ very

little there is one phase of the situation regarding which there is no difference of opinion, and that is the pitiful estate of Belgium, which, at peace with all its neighbors and without any quarrel in any part of the world, has been ground between the upper and the nether millstone and brought into a condition of almost total ruin.

It is hardly necessary to draw any picture here of the universal distress and misery prevailing in that unhappy Kingdom, as the daily press has done this work very thoroughly during the last three months and every tourist who has returned to these shores from any part of Belgium has added to the sad recital. Practically all the able-bodied men among Belgium's population of seven and a half million people have been drafted into service, and the women and children who are left behind, many of them, can find shelter only in the debris of their former homes and have little to subsist upon except the hope of relief from America's generous contributions.

Practically all industries in Belgium, for the time being, have been destroyed, except such as may be turned into military channels. The rubber industry is no exception. As an illustration of its present condition the case of the

Englebert company, of Liege, might be cited, whose New York representative states that nothing has been heard from the factory since the German bombardment, but through other channels it has been known that this factory, which before the opening of hostilities was engaged in making tires, tubes, tennis balls, mechanical goods and druggists' sundries, has been

seized by the Germans and is employed in the manufacture of tires for the Kaiser's military motors. Accurate news from

the other rubber manufacturers in Belgium is difficult to obtain, but it is quite safe to say that none of them are operating except those that are being operated for military purposes.

The rubber industry in Belgium was in a prosperous condition up to the first of August, when the Germans invaded that Kingdom. Belgian rubber manufacture began as far back as 1852, which was only a few years later than the beginning of rubber manufacture in the United States. In that year a factory was established at Molenbeek St. Jean by Gustave Luyckx, of Brussels. A very interesting phase of Belgian rubber history lies in the fact that the second factory to be established in that country—which began operations in the late 50's—was founded by an American, and quite a remarkable American, Jonathan Gage Stickney, who was born in Beverly, Massachusetts, in 1819, became associated with Samuel Colt, the inventor of the Colt revolver and an uncle of the present president of the United States Rubber Co. About the middle of the last century Mr. Stickney went to Europe to establish factories for the manufacture of the Colt firearms, but through some misunderstanding with his American principals, he left their employ and took a pleasure trip to Paris, where he fell in with Charles Goodyear, then

making his famous rubber exhibit at the Paris Exposition. Stickney at once saw the possibilities in this new industry and under

Goodyear's direction erected a factory in France for rubber manufacture. Soon after, about 1859, he built a second rubber factory, this time locating at Menin, Belgium, only a few miles southeast of Ypres, which has figured so conspicuously in the present war. He not only erected the building but he built his own washers, mixers and calenders and all the rubber machinery, and he did

it so well that it was still in active operation in the same mill 50 years later.

KING ALBERT OF BELGIUM

RECEIVING RUBBER AT ANTWERP.

Since those early days the number of rubber factories in Belgium and its general interest in this line of manufacture have steadily increased, so that it has at present, or, more properly, had before the opening of the European conflict, 12 considerable factories, 3 in Brussels, 3 in Liège, one of them the plant of Englebert & Cie referred to above, 1 in Ghent, the Colonial Rubber Co., Limited, 4 in Malmédy.

EXAMINING RUBBER AT THE ANTWERP MARKET.

cluding the Michael-Jackson Co. and Defauw Freres, and one in Alost.

These factories turned out a great variety of rubber goods, including hard rubber products and, latterly, rubber footwear.

In addition to the companies mentioned above there are two others which for several years past have been engaged in the reclaiming of rubber, and there were many other small work shops making rubber stamps and waterproofing clothing, bringing the list of Belgian rubber factories, all told, probably up to thirty. It is safe to say that at least 4,000 workmen were engaged in the different Belgian rubber factories before these works were compelled to close down.

The enterprise of the Belgian rubber people was shown to a marked extent by the very fine exhibit they made at the rubber show held in New York in the fall of 1912, their display including some 85 classified rubber samples, provided by the Antwerp Chamber of Commerce. Their exhibit at the London rubber exposition held last July was notable. It was referred to in the August number of THE INDIA RUBBER WORLD as follows:

"Numberless pages might be devoted to this exhibit without approach to justice in the description. It is doubtful if anything more beautiful, more comprehensive in its character or more informing generally than this Belgian exhibit has ever been seen at a commercial show. Perhaps some idea of its size may be conveyed to those who have visited Agricultural Hall by the statement that this Belgian exhibit filled the entire entrance as well as King George's Hall; and possibly the pictures here shown, may afford some slight idea of its character."

But probably to the American trade the most interesting

phase of the rubber industry in Belgium is the crude rubber market, situated at Antwerp. It would be very interesting, if there were space, to describe the development of Antwerp as a shipping port, but it can only be mentioned here that the authorities of the city intended to create at Antwerp the largest harbor in the world and up to 1909 had spent \$45,000,000 to effect this purpose, with the expectation of spending over \$50,000,000 more, hoping to complete the work by 1920. While the number of vessels docking at Antwerp in the years 1911 and 1912 was not much over one-third of those entering the port of Hamburg, the Antwerp tonnage for these two years exceeded the Hamburg tonnage. But the one feature of Antwerp commerce of interest to the readers of this paper is its commerce in crude rubber. Its imports of this article increased during the last 20 years from 724 tons to 7,703 tons. Here is a table giving the annual imports for the last 21 years:

The Imports of Crude Rubber at Antwerp from 1893 to 1913.					
1893tons	724	1900tons	5,698
1894	1,393	1901	5,849
1895	1,406	1902	5,403
1896	1,115	1903	5,726
1897	1,679	1904	5,763
1898	2,014	1905	5,713
1899	3,402	1906	5,772
			1907tons	5,054
			1908	5,035
			1909	4,685
			1910	4,058
			1911	4,335
			1912	4,777
			1913	7,703

Ten to fifteen years ago nearly all the rubber imported into Antwerp came from the Congo Free State. For instance, of the total in 1901—5,849 tons—5,417 tons was Congo rubber and only 432 tons came from other sources. But during the last few years Antwerp has received increasing quantities of rubber from the Belgian plantations in the Far East. The table given below showing all the sources of Belgium rubber importations for the last three years will be found interesting:

SECTION OF THE BELGIAN EXHIBIT AT THE LONDON RUBBER EXHIBITION.

Imports of Crude Rubber into Belgium for 1911-12-13 and the Chief Sources of Supply

From	1911	1912	1913
Belgian Congo	4,020	4,530	3,590
Ceylon		1,080	2,288
Straits Settlements	857	495	505
British Indies		47	87

United States	529	523	318
France	1,326	1,171	949
Great Britain	1,550	2,001	3,035
Netherlands	735	1,119	1,361
Other countries	2,168	2,704	2,512
Total	11,185	13,670	14,745

PLANT OF ENGLEBERT & CIE.

A comparatively small percentage—ranging from 20 to 25 per cent of the Belgian rubber imports represents Belgian consumption, the remainder being distributed to various points. This distribution for the last three years is shown in the following table:

Exports of Crude Rubber from Belgium During the Last Three Years and Principle Points of Destination.

To	1911	1912	1913
Germany	1,458	1,623	1,919
United States	2,651	2,726	2,775
France	1,045	1,455	1,058
Great Britain	917	801	717
Hamburg	1,064	906	783
Netherlands	680	1,011	1,176
Russia	1,021	1,899	2,091
Other countries	331	741	572
Total	9,167	11,162	11,091
Total imports	11,185	13,670	14,745
Total exports	9,167	11,162	11,091
Belgian consumption	2,018	2,508	3,654

ENTRANCE TO BELGIAN EXHIBIT AT THE LONDON RUBBER EXHIBITION.

It will be noticed from the table of imports above that Belgian rubber imports from the Far East have increased

rapidly during the last three years, amounting in 1913 to 2,980 tons, as compared with 857 tons two years earlier. The greater part of this rubber came from the estates established by Belgium in Malaya, Java and Sumatra. But the story of rubber importations in Belgium during the last thirty years has to do chiefly, in fact almost entirely, with the Belgian Congo.

The first authentic information on the Congo country was given to the world in 1869 by the great missionary explorer, David Livingstone. The Upper Congo was explored by his successor, Henry M. Stanley, who organized there the International African Association, its promoter being King Leopold of Belgium. Stanley first told the world of the great material resources in ivory, rubber and other products of the Congo. The first exports from that section were confined to ivory and rubber, as the cost of transportation made it impracticable to bring any of the other products of that vast territory to the markets of the world. The shipments of rubber from the Congo began in 1887, when 33 tons were exported. The volume of exports increased rapidly, reaching 136 tons in 1890, over 600 tons in 1895, and reaching their

MAP SHOWING CONGO FREE STATE.

maximum, 6,614 tons, in 1901. This rubber was largely extracted from the *Landolphia* vine and secured in such a way that in most instances the vine was destroyed. THE INDIA RUBBER WORLD took early cognizance of the rubber possibilities of the Congo and in its December issue in 1892 it printed a two and a half page article descriptive of the development of that country and giving the first accurate map of the rubber section of the Congo that had appeared in this country.

The prospects for profitable operation were so great that many companies were formed to extract the Congo rubber and to develop the country in various ways. Among the pioneers in this work was an American, Warren C. Unckles, of New York, who arrived at Boma in July, 1892, and proceeding thence up the Congo river, established rubber camps along the tributaries of the Kassai, which flows into the Congo from the south.

The Conference of the Powers held at Berlin in 1885 constituted this territory into the Congo Free State, with Leopold II as sovereign, and from that time for the next 23

years Leopold had autocratic powers, the Congo being governed through three secretaries general, namely, of foreign affairs, finance and interior, all appointed by the King and responsible only to him. The various companies that received concessions in the Congo were as a rule compelled to give the government either one-half of their capital stock or, which amounted to the same thing, one-half of their profits. Some of these companies enjoyed large profits for many years. The Compagnie du Kassaï is said to have made a profit in the year 1905 of \$1,500,000, its dividends that year being three times the face value of its shares. One of the companies which received a very large concession amounting in two tracts to 2,471,000 acres—from Leopold was the American Congo Co., incorporated under the laws of the State of New York in October, 1906, but soon absorbed by the Intercontinental Rubber Co., a New Jersey corporation formed a few months later to take over these concessions.

It is safe to say that no other rubber producing country in the world has received the attention that has been directed to the Congo. For a number of years before Leopold gave up his control of the Congo Free State the whole Christian world was shocked from time to time by the stories that reached it of the atrocious treatment of the natives, who, it was stated, were compelled to gather rubber by the threat and infliction of various kinds of torture. Several books were written on this subject, pro and con, and it was made the theme of warm debates in the House of Commons. Finally the Belgian government appointed a committee to investigate, which, while denying actual atrocities, admitted that much pressure was brought upon the natives to compel them to do the desired amount of work.

In November, 1908, the Congo Free State passed from under Leopold's rule to the control of the Belgian parliament, and since that time nothing has been heard about cruelties on the Congo.

There are five large companies in Antwerp which, up to the closing of that port, were engaged in the importation of rubber, this number including Grisar & Co., Bunge & Co., Credit Colonial et Commercial—formerly L. & W. Van de Velde—and G. & C. Kreglinger.

Whether the outcome of the war will make any change in the ownership of the Congo country remains to be seen, but the future production of rubber from that section will not depend upon the flag that may fly on the banks of the Congo and the Kassaï, but upon the price of crude rubber in the markets of the world. Great efforts have been made during the last few years to keep the *Landolphia* vine from destruction, and since 1910 planting has been done on quite an extensive scale. The Belgian Government had planted up to 1912 three and a half million *Funtumia* trees, 250,000 *Hevea* and about 150,000 *Manihot* trees. Systematic tapping experiments have been carried on by both the government and private interests for the

last three years, and there is every reason to believe that the *Hevea* can be made to produce to advantage along the Congo; but if the eastern planters finally succeed in bringing their rubber to market at a shilling a pound, the planters along

SHIPPING RUBBER ON THE CONGO.

the Congo will be confronted with a problem in competition that may be extremely difficult for them to solve.

BOOTH LINE SERVICE.

The steamship service between the United States and Northern Brazil and the Amazon has at no time since the beginning of European hostilities been seriously affected.

The usual sailings and the regular schedule have been maintained by the Booth Steamship Co., and every effort has been made to afford the usual facilities for the movement of rubber from the Amazon Valley. Imports of crude rubber have been received without interruption, and in some instances in quantities above normal. The difficulties of operating ocean going

CLEANING RUBBER IN THE CONGO COUNTRY.

steamships at the present time are many. For instance, the war risk, insurance on hulls and particularly the decline in exports from New York to Brazilian ports, make the shipping business between North and South America extremely uncertain, but the Booth line is determined to keep up efficient service in spite of the heavy additional costs and exceptional risks due to war.

WHAT IS "JALUBA" OR "JAPUDA" GUM?

An inquirer recently called up this office in search of information regarding "Jaluba" gum. A few days later a letter was received from another quarter with this question: "What is Japuda gum?" Unfortunately, this office was able to throw no light on either subject. Possibly Jaluba is another name for Japuda, or, conversely, Japuda but a synonym for Jaluba. Can anyone give any information concerning these two mysterious gums?

The Use of Rubber in the Armies of the World.

By Leon L. Watters, M. D., Hospital Supply Co., New York.

STRIPPED of its glamor, the practice of an army at war is to kill or maim as many of the enemy as possible by the employment of any of the many recognized "legitimate" means for dealing death and destruction. Thus land warfare exposes itself in all of its horror to the gaze of the lover of peace, as conforming exactly to General Sherman's classic designation of it.

This article does not aspire to deal at all with the ethics of war; it concerns itself solely with one economic phase of the practice of warfare, namely, the economic employment of rubber

RUBBER BANDAGES

in its armamentarium. But the anomalies of strife with arms are immediately brought to the mind of the writer when he contrasts the elaborate methods which have been worked out by some of the brightest minds of nations with the one end in view of creating havoc, death and devastation, with the equally elaborate means that these same nations provide for alleviating the sufferings, injury and poverty which are the immediate results of war. While in times of peace the life and property of the individual are sacred and extreme precautions are taken to safeguard his well-being; while all the methods of science are exhausted to save the life of even the most humble citizen; while the skill of the most expert surgeon is brought to bear to repair the slightest injury to a helpless child or a decrepit octogenarian; yet, in time of war, every available means is employed to kill or maim the flower of a nation's manhood. The individual and the life or injury of the individual, as such, are lost sight of. Armies are simple masses with large numbers of units; they are employed as masses with a brutal disregard of the life and limb of the individual except as his death or injury, in large enough numbers, affects the fighting ability of the mass.

The armies of every civilized nation worthy of the name have special and well-organized branches of the service whose sole object is to care for the health and welfare of the soldier in times of peace and to minister to the injured and the sick in times of war. A story prevails among the correspondents who were on the scene to the effect that during the Balkan war, trainloads of injured soldiers were sent to the rear. The argument of the commanders was that it costs more to take care of a wounded soldier, whose usefulness has been impaired, than to bury a dead one. This story, whether true or not, is a strong argument for the use of rubber in the

army. Then commanders pay attention to the care of the wounded from two distinct motives; the first is the motive of humanity, which makes it incumbent on a nation at war to care for the injured of its own army and of its enemy; the second motive is an economic one, based upon the value of the individual soldier as a fighting unit. The soldier who is temporarily disabled and who can be nursed back to health and healed of his wound can again enter the ranks and become active as a useful member and thus help to effect the destruction of the opposing army.

To take care of the wounded in such manner that suffering is reduced to a minimum and the maximum number of lives saved, requires that the facilities of the hospital be duplicated to such an extent that at least temporary relief is as close as possible to the scene of hostilities. Thus the requirement of quick transportation is immediately presented, for means of relief must be such that it may be transported from place to place with practically the same speed as a moving

RUBBER TOURNIQUET

army, which means often over rough roads and under adverse conditions. Lightness becomes of prime importance as well as the property of being compressed into small bulk. Beyond this

is the requirement of impermeability to moisture. It is for these reasons that rubber becomes the ideal substance for employment in the manufacture of munitions for the Medical Supply Corps of armies in the field.

The uses of rubber for other than medical and surgical purposes in the army are well known. To enumerate only a few there might be mentioned the following: Waterproof coverings for wagons, guns and gun-carriages, army chests and the like, where there is employed either a rubber-covered

fabric similar to rubber sheeting or fabrics of cloth which are rendered waterproof by being impregnated with compounds of rubber. Rubber boots and shoes are part of the regular equipment of most armies, though they are made use of only under special conditions, on account of the more lasting qualities of leather.

Rubber sheets and blankets are in extensive use for protection from damp, and rubberized fabrics are even employed as tent coverings. Rubber-covered rain coats are in extensive use by the officers and chapeaus or mantles are employed by the privates as protection from rain. There is a growing tendency to employ rubber-coated fabrics wherever possible as coverings for medical pouches, first-aid kits, etc., and the

U. S. ARMY STRETCHER

rubber manufacturers will find the authorities of the Medical Supply Depots desirous of welcoming any suggestions for further applications of rubber to existing equipment.

Of decidedly varied employment, however, are articles of rubber for medical and surgical purposes. Experiment and experience have shown that articles of rubber fulfil the requirements both of lightness and of freedom from breakage. We enumerate a few of the more important items employed in the Field Medical Supply Department of our own army: Hot-water bottles; ice-caps; syringes, both of hard and soft rubber; atomizers; powder dusters; catheters; stomach, colon and rectal tubes; operating cushions or "Kelley pads"; air cushions and air beds; rubber gloves and finger cots; tubing; sheeting; tourniquets; aprons; funnels; bandages; crutch tips; medicine droppers; collapsible drinking cups; folding buckets and bath tubs; parts of inhalers; washers for hypodermic and other syringes.

Incidentally, the Medical Supply Division of the United States Army is said to be in a position to take care of the wants of an army far in excess of our present standing army, on forty-eight hours' notice.

UNITED STATES ARMY TOURNIQUET.

In addition to these, the governments use extensive quantities of hard rubber goods for general purposes. These embrace combs; tooth, hair and nail brushes; soap dishes, etc.

The Medical Supply Section of our own army is under the immediate jurisdiction of the surgeon-general, whose office is in Washington. Supplies for the army are purchased by the officers in charge of the various Medical Supply Depots, which carry stock in New York, St. Louis, San Francisco and some other cities. Supplies are generally purchased upon competitive bids. Specifications for annual stocks are issued once a year, but additional specifications are issued almost continually during the year. The Field Medical Supply Depot is a special branch of the service, with headquarters at Washington.

THE EMDEN'S END A RUBBER RELIEF.

It is stated that the "Emden," the German cruiser which sunk twenty-five or more merchantmen belonging to the Allies before it was brought to book by the Australian "Sydney," cost the rubber industry, or more accurately the rubber insurers, about a million dollars. Three of the merchantmen sunk by the "Emden's" guns had cargoes of rubber from the Far East, bound for London, amounting, all told, to about 3,000 tons.

A NEW LIFE-SAVING INVENTION.

A recent report of Consul General R. E. Mansfield, stationed at Vancouver, British Columbia, contains a description of a life-saving suit invented by Captain More, a shipmaster of Vancouver, and patented in Canada, Great Britain, France, the United States and Belgium. It is made of rubber and can be easily put on. It is entered from the top, is equipped with a hood which, when adjusted, leaves only the face exposed to the water. A belt, passing around the body just below the arms can be quickly inflated by blowing into a tube attached. The wearer floats in an upright position and watertight pockets on each side provide receptacles for food and liquids. Successful experiments have recently been conducted and demonstrations made in the use of this suit.

AMERICA AND THE EUROPEAN WAR.

By Ludwig W. Schmidt.

FROM general information received by the writer in private letters, it seems that the German rubber industry was fairly active during the first months of the war, and, considering the enormous demand for war materials and the influence rubber has on many industries connected with the production of such supplies, it appears that the demand for rubber manufactures will continue at least as long as Germany can keep the enemy outside her boundaries. The rubber industry in England is certainly as busy as it is in Germany, and its opportunities are greater. England can add to the demand from her own war office the considerable amount of private business done by Germany before the war, provided her industry is able to replace German goods in quality and price. Little definite information has been obtained regarding the French rubber industry, but it can be surmised that the works which are interested in the manufacture of war material will be kept busy.

Under these circumstances it is clear that the demand for raw rubber must be very large. Germany cannot get new supplies. It has, as far as can be ascertained, large quantities of raw rubber in stock, which, however, must some day be exhausted; and it is an interesting problem what Germany will then do. It is very likely that her reclaiming industry is already supplying that part of the demand which until now has been supplied by American reclaimers. It is impossible to say whether any amount of reclaimed rubber is still leaving this country for Germany. If so, the quantity must be small.

Everything, therefore, points to the conclusion that at the end of the war stocks in raw material as well as in reclaimed rubber will be small and that large replenishments will have to take place. It is impossible to say what the end of this conflict will be and what the economic situation in the warring countries will be at its conclusion. However, it seems practically certain that a new and strong demand for raw material and reclaimed rubber will arise as soon as normal conditions have been restored. This will materially affect the American reclaimer. The European field has been a very good one for him in the past and there is no reason why it should not again be as satisfactory. Of course it will take some time to resume old relations, and confidence will be shaken. Nevertheless, it would be bad policy to let the war interfere with development of business in Europe. The markets of England, France, Germany and some of the other countries are closed, but those of Spain and Italy remain open and it is to be hoped that these nations will be able to maintain their neutrality. Both these markets can be entered successfully by the American reclaimer, and it would be advisable to take steps at once to develop this export business, while Russia, one of the largest producers of reclaimed rubber, is greatly hampered in her movements and the Russian industry suffering in consequence. Having secured a foothold in these two markets, it will be much less difficult to resume business relations in the older markets when peace is restored than it would be if relations had been entirely cut off.

Incidentally it may be remarked that, as a result of the war, there will not only be a large demand for reclaimed rubber, but in addition to this there ought to be an increase in the supply of waste rubber. Whether this will be of the first class, of course, is doubtful. War waste as a rule is not of the highest grade, but the cessation of collection during the past few months will bring in its wake a larger volume of material, which ought to benefit the reclaimers in the United States. It seems probable, therefore, that the war, while at the moment stopping the business of the American reclaimer in Europe, will not injure it permanently. On the contrary, a large demand can be expected when normal market and manufacturing conditions are restored.

The Work of the Bureau of Standards on Rubber.

THE constitution of the United States gives to Congress the right to fix the standards of weights and measures.

Whether this provision of the constitution was necessary to justify the institution of the Bureau of Standards at Washington need not be discussed, but it may be cited as the authority for the action of Congress in providing for this bureau.

FIG. NO. 1.

There has been confided to it the charge of all the standard weights and measures in possession of the federal government, or at least such of them as are the standards from which our weights and measures are derived.

In connection with the standardization of weights, measures and apparatus of many kinds there is a large amount of work conducted along other scientific lines, including mechanical, chemical and electrical. Along what are known as more practical lines a great number of tests are made on a wide variety of materials, particularly those used in government supplies. Among the articles so used and tested are many kinds of rubber goods.

In many cases this bureau acts as the examining chemist for the departments which purchase the supplies. In doing this they have a broader idea than the ordinary chemist who is endeavoring to protect his client only, for the bureau tries to work with the manufacturer as well as with the purchasing agent so as to help the maker to produce the best goods as well as to provide those that are best suited for the government's use. The private consumer ordinarily wants to get the best goods and is not disturbed if others—particularly if they are competitors—get an inferior quality. Nor does the ordinary purchaser endeavor to help the manufacturer who furnished the goods. But this bureau believes it good policy to help the manufacturer, so as to secure desirable products for the government.

In pursuing this policy much work has been done on the preparation of suitable specifications which shall be at the same time just to both parties and allow the most economical article that is adapted to the purpose.

In the rubber line one notable instance of co-operation of this bureau with manufacturers and consumers is its work with the Joint Rubber Insulation Committee. Mr. J. B. Tuttle of the

Standards Vol. 8, No. 3 was published, entitled "The Determination of Total Sulphur in India Rubber." It was by C. A. Waters, associate chemist, and J. B. Tuttle, assistant chemist. A pamphlet entitled "The Sampling of Rubber Goods," was reprinted in the "Journal of Industrial and Engineering Chemistry," with the permission of the director of the bureau of Standards.

Circular No. 38 of the Bureau of Standards, published for distribution in 1912, is entitled "The Testing of Mechanical Rubber Goods," and the second edition was published in April, 1913. This contains notes on the sources of supply and collection of rubber, rubber substitutes and reclaimed rubber, as well as descriptions of the processes of manufacture, also physical testing of rubber, chemistry of rubber and regulations regarding tests. Most of the apparatus used by the bureau in the work is here illustrated, as well as the methods used in testing.

FIG. NO. 3. TESTING MACHINE OPERATED BY STEAM OR WATER.

In performing the chemical analysis there is no special apparatus used not found in most laboratories, but the extractors are always the most important feature of rubber analysis. Figure No. 1 shows the Wiley Soxhlet extractor as modified by Ford.

Figure No. 2 shows a hand testing apparatus for determining the bursting pressure of hose. Figure No. 3 illustrates a testing machine operated by a steam or water cylinder. Back of the machine is a press for cutting samples. Figure No. 4 shows a hand press and sample cutter with the cut sample beside it; while Figure 5 shows a set of rubber mills geared to, and operated by, a motor. The mills include a cracking mill, a mixing mill and a three-cylinder calender for making frictions, etc. The mixing mill and the calenders are arranged for steam and water circulation through the rolls. This apparatus has just been put in and it is expected that some very valuable experimental work will be accomplished with its aid. THE INDIA RUBBER WORLD has obtained from the bureau a description of their methods of chemical testing which follows in full.

FIG. NO. 2. APPARATUS TO DETERMINE BURSTING PRESSURE.

bureau acted with the committee, and its proceedings were republished for general distribution with the approval of the bureau.

In 1912 Reprint No. 174 from the bulletin of the Bureau of

FIG. NO. 4. PRESS AND SAMPLE CUTTER.

THE BUREAU DESCRIBES ITS METHODS OF TESTING.

DEPARTMENT OF COMMERCE,
BUREAU OF STANDARDS,
WASHINGTON.

The methods given below are those now in use at the Bureau of Standards and are offered essentially as they appear in the sheets of instructions handed to all rubber analysts in the Bureau. They are not entirely original, but have been compiled from the various publications on rubber analysis and from the information gained through the routine testing of rubber goods for delivery on government contracts, and co-operative research with various scientific organizations. These methods are always subject to revision whenever the Bureau is convinced that changes would improve them.

PREPARATION OF SAMPLES.

1. **SOFT RUBBER**—Prepare a sample of not less than 25 grams, taking pieces from various parts of the original sample. With those having cover and tube, separate samples of each shall be made. From fire hose remove the backing before grinding.

2. **GRINDING**.—The sample shall be cut into small pieces and then run through grinder, taking for analysis only such material as will pass a 20-mesh sieve. Care must be taken to see that the grinder does not become appreciably warm during the grinding. If the nature of the material is such that it gums together so that it will not pass through the sieve (as would be the case with undervulcanized samples), it will be sufficient to pass the material through the grinder twice and accept all the material for the final sample. Crude rubber shall be cut with scissors.

3. **HARD RUBBER**.—Samples of this material shall be prepared for analysis by rasping.

REAGENTS.

4. Acetone shall be freshly distilled over anhydrous potassium carbonate, using the fraction obtained at 56 to 57° C.

5. Alcoholic potash shall be of normal strength, made by dissolving the required amount of potassium hydroxide in absolute alcohol, and allowing it to settle. Only the clear solution shall be used.

6. The nitric acid-bromine reagent shall be prepared by adding a considerable excess of bromine to concentrated nitric acid, shaking thoroughly, and allowing it to stand for some hours before using.

7. The fusion mixture for sulphur determinations shall be made by mixing equal quantities of sodium carbonate and powdered potassium nitrate.

8. All reagents shall be of C. P. quality.

9. Barium chloride solution shall be made by dissolving 100 grams of barium chloride in one liter of distilled water, and adding two or three drops of conc. hydrochloric acid. If there is any insoluble matter or cloudiness, the solution shall be heated on the steam bath overnight, and filtered through 589 blue-ribbon filter paper.

ANALYSIS.

I—MECHANICAL GOODS.

10. **ACETONE EXTRACT**.—Place a 2-gram sample in an acetone extracted S. & S. paper thimble, and extract continuously with acetone for eight hours, unless the solution in the thimble is still colored at the end of that time, when the extraction shall proceed the next day for a further period of four hours. Transfer the extract to a tared 100 or 150-cc. Erlenmeyer flask, using chloroform or benzene for dissolving any material which may have separated from the solvent during the course of the extraction. Drive off the solvents at as low a temperature as possible, using a gentle current of air. Dry the flask and contents in an air bath, at 90 to 95° C.; cool and weigh. Call the residue "acetone extract, uncorrected." Calculate the results to percentage.

11. **FREE SULPHUR**.—Add to the flask from par. 10, containing the acetone extract, uncorrected, 50 to 60 cc. of distilled water, and 2 or 3 cc. of bromine. (If the acetone extract indicated a large amount of free sulphur, the amount of bromine used may be increased). Heat gently on the steam bath until the solution is practically colorless, filter into a 250-cc. beaker. Cover the beaker with a watch glass, heat to boiling on the steam bath, add 10 cc. of 10 per cent. barium chloride solution, and allow the precipitate to stand overnight. The next day filter the precipitate through an 11-cm. 590 S. & S. filter paper. Ignite in a small porcelain crucible, using a small Bunsen flame, and not allowing the paper to inflame; cool and weigh. Calculate the barium sulphate to sulphur by means of the factor 0.1372, and calculate the percentage of free sulphur.

12. **ASH**.—Wrap a 1-gram sample in an 11-cm. 590 S. & S. filter paper, and after extracting with acetone for four hours, transfer to a medium sized porcelain crucible and ignite at the lowest possible temperature; cool and weigh.

13. **SULPHUR IN ASH**.—Add a few drops of conc. nitric acid to the ash from par 12, stir with a small glass rod, and evaporate off the excess acid on the steam bath. Add 5 grams of fusion mixture (par. 7), and heat until fused. When cool, place the crucible in a 400-cc. beaker, cover with water, and heat on the steam bath for two or three hours. Filter into a 600-cc. beaker (reserve the insoluble residue for testing according to par. 14), add 7 to 8 cc. conc. hydrochloric acid to the filtrate, cover, and heat to boiling on steam bath. Add 10 cc. of 10 per cent. barium chloride solution, and allow to stand overnight. Treat the barium sulphate precipitate as under par. 11. Calculate to sulphur by the factor 0.1372.

FIG. NO. 5. SET OF RUBBER MILLS GEARED TO, AND OPERATED BY, A MOTOR

14. **BARYTES.**—In the event that the total sulphur is limited by specification, and barytes is permitted as a filler, the latter must be determined, since the sulphur present in this mineral must be deducted from the total sulphur. The barytes is calculated from the barium in the ash determined as follows: Filter off the insoluble matter after the fusion and extraction in par. 13, wash back into the original beaker with hot water, add 5 cc. of 10 per cent. hydrochloric acid, and heat the solution on the steam bath until as much as possible is dissolved. Filter through the same filter as before, washing thoroughly with hot water. Nearly neutralize the solution with sodium carbonate, leaving it slightly acid. Saturate the solution with hydrogen sulphide, and when the lead sulphide has settled filter into a 400-cc. beaker, and wash thoroughly. The total volume should not be over 200 cc. Cover the beaker containing the filtrate, heat to boiling, and add 10 cc. of 10 per cent. sulphuric acid. Allow the precipitate to stand overnight. Filter off the barium sulphate as directed in par. 11. Calculate the percentage of barytes. Then calculate the percentage of sulphur in the barytes by the factor 0.1372.

15. **TOTAL SULPHUR.**—Place 0.5 gram of rubber in a porcelain crucible of about 100 cc. capacity. Add 20 cc. of the nitric acid-bromine mixture (par. 6.), and cover the crucible with a watch glass. Heat very carefully for half an hour to an hour, remove the cover, rinsing it with a little distilled water, and evaporate to dryness. Add 5 grams of fusion mixture (par. 7) and 3 to 4 cc. of distilled water. Digest for a few minutes, and then spread the mixture halfway up the side of the crucible to facilitate drying. Dry on a steam bath or hot plate. Fuse the mixture, using a sulphur-free flame, until all the organic matter has been destroyed and the melt is quite soft. Allow to cool, place the crucible in a 600-cc. beaker, and cover with distilled water. Digest 3 or 4 hours on the steam bath. Filter into an 800-cc. beaker, washing thoroughly with hot water. The total volume should be about 500 cc. Add 7 to 8 cc. conc. hydrochloric acid to the filtrate, and heat on the steam bath. Test the solution for acidity with congo paper, add 10 cc. 10 per cent. barium chloride solution, and allow to stand overnight. Filter off the barium sulphate as before. Calculate to percentage of sulphur present.

16. CALCULATIONS.—

- Subtract the "free sulphur" from the "acetone extract, uncorrected," and report the difference as "acetone extract corrected."
- Subtract the sulphur in the ash from the ash as determined in par. 12, and report "ash, sulphur-free."
- Subtract from the total sulphur determined according to par. 15, the percentage of sulphur present as barytes, if the latter determination has been made (see par. 14), and report the difference as "total sulphur, corrected." Then add the sulphur so deducted to the ash, in this case reporting the latter simply as "ash, corrected." In other words, only the sulphur other than that in barytes will be deducted from the ash when the total sulphur is corrected for barytes.
- Subtract from 100 per cent. the sum of the acetone extract, corrected, total sulphur (corrected or not as the case may be), and ash (sulphur-free, or corrected for sulphur other than barytes) and call the remainder "rubber by difference."
- Divide the acetone extract, corrected, by the sum of the acetone extract, corrected, and the rubber by difference, and call the result, "ratio, acetone-extract rubber." It will be simpler to express the results in percentages. When new rubber only is used this will give the percentage of acetone-soluble matter in the rubber.

17. **SPECIFIC GRAVITY.**—Make this determination in a pycnometer, using about 5 grams of rubber cut into small strips, taking care to avoid having air bubbles adhering to the rubber. Do not use a ground sample for this determination, since it is intended to determine the specific gravity of the compound as a whole. Aside from the difficulty of completely removing air bubbles, the specific gravity of a sample which is at all porous will be, after grinding, higher than when this is determined on strips. Calculate the specific gravity on the basis of water at 15° C. as 1.00.

18. **ALCOHOLIC POTASH.**—Fire hose, tested according to the National Board of Fire Underwriters' specifications, calls for an alcoholic-potash extraction. It is performed on the dried

rubber remaining after the acetone extraction. The complete method will be given under par. 28.

II INSULATION, 30 PER CENT. PARA.

19. **GENERAL.**—The tests to be made on high-grade insulation compounds are: Acetone extract, unsaponifiable matter, waxy hydrocarbons, free sulphur, ash, and total sulphur, and sometimes alcoholic potash and chloroform extracts.

20. **ACETONE EXTRACT.**—Determine as under par. 10.

21. **UNSAAPONIFIABLE MATTER.**—Add to the acetone extract from par. 20, 50 cc. normal-alcoholic potash (par. 5), heat on steam bath under reflux condenser for two hours; remove condenser and evaporate to dryness. Transfer to separatory funnel, using about 100 cc. water; add 25 cc. ether, and shake. Allow the two layers to separate thoroughly, then draw off the water layer. Continue the extraction of the water layer with fresh portions of ether until the ether will no longer remove any unsaponifiable matter; unite the ethereal layers, and wash with distilled water, adding the first wash water to the extracted aqueous layer. This aqueous solution is reserved for the free-sulphur determination (par. 23). Transfer the ether to a tared Erlenmeyer flask, distill off the ether, dry at 90 to 95°C.; cool and weigh.

22. **WAXY HYDROCARBONS.**—To the unsaponifiable matter from par. 21, add 50 cc. absolute alcohol, and heat on the steam bath for one-half hour. Place the flask in a mixture of ice and salt, and let stand for one hour. Filter off the separated waxy hydrocarbons, using S. & S. 589 blue-ribbon filter paper, and applying a gentle suction. Wash with alcohol which has been cooled in an ice-salt mixture. The funnel should be surrounded by a freezing mixture, in order that the temperature may not rise during filtration. Dissolve the precipitate from the filter paper with hot chloroform, catching the solution in a weighed 100 to 150 cc. beaker. Wash the flask with hot chloroform and add to the same beaker, in order to include any insoluble matter adhering to the walls of the flask. Evaporate off the solvent, dry the residue at 90 to 95°C., cool and weigh.

23. **FREE SULPHUR.**—Transfer the water layer from par. 21 to a 250-cc. beaker, and heat on the steam bath until the ether has been removed. Add 25 cc. bromine water, heat one hour, add 5 cc. conc. hydrochloric acid, and heat until the excess of bromine has been driven off. (Test for acidity with congo paper; the amount of acid specified is sufficient if instructions are followed exactly, and a large excess of acid is to be avoided.) Filter into a 250-cc. beaker, add 10 cc. 10 per cent. barium chloride solution, and finish the determination as under par. 11.

24. **ASH.**—Proceed as under pars. 12 and 13.

25. **TOTAL SULPHUR.**—Proceed as under par. 15. There will be no correction for barytes.

26. CALCULATIONS.—

- Subtract the sum of the free sulphur and waxy hydrocarbons from the acetone extract, uncorrected, and report the difference as "acetone extract, corrected."
- Subtract from 100 per cent. the sum of the acetone extract, corrected, waxy hydrocarbons, ash sulphur free, and total sulphur, and report the result as "rubber by difference."
- Divide the acetone extract, corrected, by the sum of the acetone extract, corrected, and the rubber by difference, and report the result under "ratio, acetone extract rubber," as under par. 16e.

27. **CHLOROFORM EXTRACT.**—Without removing the acetone from the rubber from par. 20, extract with chloroform for four hours. Evaporate off the solvent in a weighed flask or beaker, dry at 90 to 95°C., cool and weigh. Reserve the rubber for the alcoholic potash determination.

28. **ALCOHOLIC POTASH EXTRACT.**—Dry the rubber at about 50 to 60°C., transfer to a 200-cc. Erlenmeyer flask, add 50 cc. alcoholic potash solution, and heat under a reflux condenser for four hours. Filter through a folded filter into a 250-cc. beaker, washing with 50 cc. of 95 per cent. alcohol, and then 50 cc. of boiling water. Evaporate the filtrate to dryness. Transfer the residue to a separatory funnel, using about 75 cc. of distilled water. Add a few drops of methyl orange, and acidify the solution with 10 per cent. hydrochloric acid. Extract with four portions of ether, 25 cc. each, unless the fourth portion should be colored, when the extraction should be continued until no further quantity can be extracted. Unite the ether fractions, wash thoroughly with distilled water, and evaporate the ether in a weighed beaker. Dry at 90 to 95°C.; cool and weigh.

What the Rubber Chemists Are Doing.

THE PRODUCTION OF ISOPRENE FROM COMMERCIAL TURPENTINE.

THE practical basis for all synthetic rubber is the production of isoprene, and if this can be accomplished in any practical and cheap way the production of a synthetic rubber on a competitive basis with the plantation varieties would be not only possible but probable.

Therefore any method of making isoprene from cheap raw materials will always be of importance to the rubber industry.

The United States is the world's greatest producer of turpentine, and this oil has been used before to some extent as a raw material for the production of isoprene, but the results have not been in all cases satisfactory.

Some experimental work on turpentine and other pine oils has been done at the University of North Carolina by Chas. H. Herty and J. O. Graham, which has recently appeared in print in the "Journal of Industrial and Engineering Chemistry," from which we quote an abstract: "In connection with studies of rubber made by polymerization of isoprene Harries and Gottlob (Ann. vol. 383, p. 228) described a method for the preparation of isoprene from spirits of turpentine by means of the 'isoprene lamp.' In this method the spirits of turpentine is boiled in a flask just below the neck of which is suspended an electrically heated platinum wire coiled somewhat like the filament of a tantalum electric light."

The vapors are partly decomposed as they pass upward across the heated wire. The flask is attached to an upright condenser maintained at a temperature of 50 deg. C. for condensing the unchanged (and polymerized) vapors of the turpentine. Beyond this is an inclined condenser kept cool and a receiver surrounded by a freezing mixture. Redistillation of the crude product from the receiver gives the isoprene distilling between 35 and 37 deg. C.

Harries and Gottlob obtained only a yield of 1 per cent. from commercial pinene or American turpentine as compared with 30 to 50 per cent. from commercial limonene. They therefore concluded that the production of isoprene from turpentine was due solely to the presence of small quantities of limonene.

Professors Herty and Graham, in view of the interest in their section of the country in the use of turpentine, have experimented not only on the production of isoprene from the commercial turpentine of that section, but also have experimented with the volatile oil of *Pinus Serotina*, or pond pine, and also with refined spruce turpentine.

Using the Gottlob and Harries apparatus, and heating the flask in a bath of cottonseed oil, a current of 2.25 amps. maintained a red glow on the wires which were wound around a pipe-stem triangular prism.

The isoprene produced was redistilled through a Hempel column, and the pure product, distilling between 36 and 37 deg. C., was taken as isoprene. Here is the result of two of their experiments:

First Experiment—200 c. c. of turpentine was boiled in the isoprene lamp until no more volatile bodies came over; and on purifying the distillate it was found that there was a yield of 18.5 per cent. of crude oil and 5.50 per cent. isoprene. The residue in the flask was 103 c. c. Thus 48 per cent. distilled over producing 18.5 per cent. distillate, showing 61.5 per cent. of distillate decomposed into incondensable gases, producing 38.5 per cent. light oil, and leaving a final residue of 52 per cent. more or less of polymerized oil. At present market prices this would make the material cost of isoprene \$1.13, allowing nothing for by-products or cost of making.

Even with a theoretical yield of rubber of first quality this

would not be a practical process, but it is much more practical than many others which have been exploited, and it points the way for improvements which may give a yield that will bring it within commercial possibilities.

Second Experiment—Commercial turpentine was fractionally distilled, and the first portion was taken off between 155 and 156 deg. C., which would contain most of the pinene. This gave a yield of 8 per cent. isoprene. This gives a material cost of 78.5 cents per pound, which is approaching commercial limits. The higher boiling-point residues from this distilled turpentine gave practically no isoprene, so it is concluded that the isoprene comes from the pinene in the turpentine.

With the oil from pond pine, which is rich in limonene, a yield of 12 per cent. isoprene was obtained.

It appears that the oil of pond pine is an oleo resin, and that it was distilled in a vacuum to produce that portion which contained the most limonene. Owing to the expense of such an operation it would make the cost greater if isoprene were produced from this substance than if produced from the distilled turpentine of the second experiment. This third experiment is, therefore, of scientific and theoretical value only.

Pine oil was also experimented on in a fourth experiment. This produced 4 per cent. of isoprene.

Pine oil is produced by the distillation of stumps or light wood from the yellow pine tree of the south, and this industry has assumed some importance of late years so that this pine oil appears on the market as a regular article of commerce. It is an oil with a specific gravity of .9403, and has a higher boiling point than turpentine, and is sold at a lower price. There is not usually enough difference in price, however, to balance the disadvantages of the smaller yield as compared with turpentine. In producing this 4 per cent. only 37.5 per cent. of the oil was distilled over, the balance remaining as a residue in the still.

The last experiment was made on spruce pine turpentine, which was produced as a distillate from the wood in a digester used for making soda pulp. This yielded practically no isoprene. The oil boiled between 171 and 174 deg. C.

From the above work it would seem that it is only necessary to get better conditions under which a greater yield of isoprene can be obtained from distilled turpentine than were gotten in these experiments to produce isoprene, and in turn synthetic rubber on a competitive basis with the natural product.

We note the specification of British patent No. 13,825, granted to C. K. F. L. Gross, of Bevön, Soon, Norway, for the manufacture of isoprene by treating the vapors of turpentine oil with one or more metallic oxides at temperatures below 700, copper oxide being instanced as suitable. The same inventor proposes to manufacture synthetic caoutchouc, according to British patent No. 13,826, by heating isoprene trioxymethylene as a polymerizing agent.

ANOTHER ACCELERATOR.

Another accelerator has been put on the British market similar to those described in the September issue of this journal in the article entitled "The Influence of Nitrogen Compounds on the Vulcanization of Rubber." This accelerator, which is called "Accelerene," is said to be an invention of an English chemist to whom protection has been granted. It is in the form of a green powder which is added to the mixing in the proportion of about one-half per cent., and which thereby reduces the time of vulcanization to about one-third that required in the ordinary way. Larger quantities reduce the time still further. It is claimed that the use of "accelerene" makes the product superior

in strength to that vulcanized in the ordinary way, and it is assumed that the shorter heating diminishes the amount of depolymerization, while effecting a more complete combination between the rubber and the sulphur. It is claimed that 100 parts of Pará and 10 parts of sulphur may be fully vulcanized by heating for 25 minutes at 40 pounds in the presence of one-half per cent. of "accelerene," while with 40 parts of sulphur a hard vulcanite is obtained by curing for two hours at 45 pounds. Its use is said also to prevent "blooming" or "sulphuring."

Attention has recently been called in these pages to the use of vanadium oxide and tungstic acid as accelerators.

A POSSIBLE NEW RUBBER CEMENT.

VULCANIZATION OF RUBBER SOLUTIONS BY THE ULTRA-VIOLET RAYS.

M. HEILBRONNER read a paper before the International Rubber Conference entitled: "The Study of Rubber Solutions Vulcanized by the Ultra-Violet Rays." This is probably a continuation of the works of Heilbronner and Bernstein, published in the *Compt. Rend.* May 11, Volume 138, 1914, page 1343, and abstracted in the *Chem. Zentr.*, Volume 5, 18, 1914, No. 4, page 326, and *Koll. Zeit.*, Volume 12, 1913, page 4, where they had shown that rubber combines with sulphur in a solution under the influence of ultra-violet rays presenting a remarkably staple gel. By evaporating the solvent a pellicle of vulcanized rubber was produced which was insoluble in solvents from which it had been evaporated. They also there stated that the ultra-microscopic method shows great quantities of small particles, but there must be many more such particles which are invisible. Dr. Heilbronner in his address said that Victor Henri in 1909-1910 was the first to expose rubber to the ultra-violet rays, carrying out vulcanization with films of solutions of rubber. Attention might be called to French patent No. 460,780, issued July 26, 1913, but which under the international conventions has the date of July 26, 1912, in which the vulcanization of rubber solutions by ultra-violet rays is claimed, and it is stated that 3 per cent. plantation rubber and sulphur in benzene exposed in thin layers vulcanize rapidly, sulphur to the extent of from $1\frac{1}{2}$ to $2\frac{1}{2}$ per cent. combining with the rubber.

Elaborate diagrams were presented by M. Heilbronner regarding the results obtained by various experiments. It appears that it is not desirable to use either flowers of sulphur or stick sulphur, both being to a great extent insoluble, but crystals of sulphur should be used. The most interesting thing is the suggestion that these solutions of rubber so vulcanized may have industrial application. They are said to be suitable for all kinds of cementing or rubberizing operations, and are capable of resisting all mechanical strains, as well as the action of heat. They can be used particularly for joining and rubberizing leather, and consequently will be valuable in the shoe industry.

Lastly, the repairs of all rubber goods, tires, inner tubes, etc., can be readily carried out by means of vulcanized solutions.

While a few years ago it would have been considered fantastic to suggest the practical use of rubber vulcanized by ultra-violet rays, recent progress has been such that by the use of a Peter Cooper Hewitt mercury light produced in a quartz tube, the ultra-violet rays pass through with such ease that they have been suggested for many purposes, such as sterilization of water, and it is possible that these solutions of vulcanized rubber may become of considerable technical importance.

By using vulcanized solutions of an altogether different concentration, 1 to 1 per cent. a positive absorption of the solution is obtained and the two pieces are no longer separated by a layer of rubber; they are in immediate contact and penetrate one into the other. By using these vulcanized solutions one obtains not an ordinary joint, but a true autogenous rubber welding.

Dr. M. G. Bernstein also read a paper entitled "The Vulcanization of Rubber by Ultra-Violet Rays." He found that a rubber solution mixed with sulphur and exposed to the action of the ultra-violet rays thickens considerably, and is transformed into a gelatinous mass; furthermore, vulcanization takes place and sulphur enters into the combination.

British Patent No. 17,195 of 1914 has been issued to G. Bernstein, and is for a process of vulcanizing a rubber solution containing 6 per cent of rubber, with 10 per cent of the rubber weight of sulphur dissolved in benzene by spreading, for example, on a moving belt a layer of about $\frac{1}{2}$ mm. thickness, and exposing it to the ultra-violet rays from a quartz tube for 45 seconds.

This would appear to be rather a difficult thing to do, for under the heat of the rays the solvent would evaporate from this thin film. It appears that if this solution of rubber, vulcanized in this way, is once dried that it cannot be brought into solution again, and accordingly cannot be used as a cement.

RECENT CHEMICAL PATENTS.

Patent for process for treating rubber, issued to Staunton Gray, Muskegon, Mich. U. S. Patent No. 1,115,031. This seems to be a process for producing rubber sponge or foam. The compound is mixed with a light hydrocarbon solvent and brought to a stiff solution. Then it is submitted to a vacuum to make it spongy, when the vulcanizing agent is admitted. (Evidently cold vulcanization is intended.) The vulcanizing agent is then neutralized. The essential idea is to produce a sponge by the vaporizing of the solvent under the vacuum, then to vulcanize cold in this state. It does not appear how the vulcanizing agent is to saturate the compound without destroying the vacuum, in which case the solvent would condense and destroy the sponge effect before the vulcanizing liquid reached it.

U. S. Patent No. 1,112,853 is for producing zinc oxide, assigned to the New Jersey Zinc Co.

THE CREOSOTE CURE FOR LATEX.

British Patent No. 13,438, of 1913, has been issued to Cleland Davidson, for a process of coagulating latex. In this patent phenol, cresylic acid or the higher tar acids are neutralized with caustic soda, and to this aqueous solution is added liver of sulphur or any other polysulphide or sulphide of potash, or soda and formaldehyde solution may then be added. A small proportion of this solution is added to the latex. The essential thing is the creosote and alkali. The other materials may be omitted. After this alkali treatment an acid is used for coagulation. The object of the treatment seems to be to cause the caoutchouc in the course of the coagulation to become homogeneously and intimately impregnated by, or incorporated with, a preservative substance. Perhaps this creosote treatment might have the same influence, to some extent, as the creosoting accomplished in smoking Pará by the Brazilian methods.

U. S. patent No. 1,098,858, granted June 2, 1914, to Franz Webel, who assigns to the Badische Co., claims the production of chlorine derivatives by reacting with chlorine on trimethyl ethylene in a vacuum. This is part of the operation of producing rubber from petroleum oils, which method has the great advantage of having a plentiful and cheap supply of raw materials.

EXPERIMENTS IN RUBBER DYEING.

Dr. Rudolph Ditmar, in "Gummi Zeitung," October 23, 1914, p. 85, has a very elaborated article describing a large number of dyes suitable for rubber dyeing and giving the results of many experiments in their use. Attention was called in the November issue of THE INDIA RUBBER WORLD to the United States patents Nos. 1,113,614 and 1,113,759, on this system of dyeing, with comments on each.

Rubber Solvents.

WHILE the larger quantity of rubber is made into manufactured products without having been brought into solution, yet there are so many uses for rubber in solution that the matter of solvents becomes of great importance. Rubber being a hydrocarbon is soluble in the usual hydrocarbon solvents. These are usually those not soluble in water and of an oily nature. A number of the more usual solvents will be described in the following paragraphs, beginning with those derived from petroleum.

SOLVENTS FROM PETROLEUM.

The petroleum oils are by far the cheapest oils in commerce, and they are solvents of rubber and are the most extensively used of any class for that purpose. In defining petroleum oils it is hard to make definite distinctions, for every oil is a mixture of many separate chemical substances, and the names used to designate them in the trade and the tests used are indefinite and the products of no two manufacturers agree in name or test.

Petroleum oils consist in the main of hydrocarbons of several series, and a large number of each series is found in each kind as it is taken from the ground.

The first oils obtained from Pennsylvania and West Virginia consisted of oils of the paraffine series exclusively having the general formula, C_nH_{2n+2} . This series begins with marsh gas with one carbon atom and goes up to the paraffine waxes with many carbon atoms in each molecule, but each compound has the same ratio of carbon and hydrogen as pointed out above.

When this oil is distilled there first passes off a little marsh gas which is dissolved in the oil, and following this is a series of products up to pentane, which boils at 36 degs. C., which are mostly lost, though products are sometimes made which will only remain liquid under pressure and will rapidly evaporate in the air. For example, there is a product known as cymogene which boils at the temperature of melting ice and has a specific gravity of 110 Be., and the next higher product is known as rhigidene, which boils at about 65 degs. F., or ordinary temperature, and has a specific gravity of 100 Be. Sometimes a product known as petroleum ether, boiling between these points, say about 50 degs. C. is made.

The next product obtained by distillation of Pennsylvania oil is petroleum ether of 85 degs. Be., or gas machine gasoline, which is very scarce now. It begins to boil at about 50 degs. C. and contains some that boils at 120 degs. C. This is sometimes called benzine but must not be confused with the coal tar benzol.

Then there is a series of gasolines of different gravities and boiling points. It was customary to use gasoline of 76 degs. Be., but this product is now almost unobtainable, and that of 66 Be., with a boiling point ranging up to 140 degs. C., is largely used. After these products come the kerosenes, or burning oils, which are not volatile enough to be used for solvents which have to be later evaporated.

The petroleum trade has clung to the use of the Baume hydrometer as a standard for grading oils, and usually no other characteristic of the oil than its Be. gravity is used in the trade. While all the oil used was of the paraffine series, the Be. gravity was an indication of its relative volatility. This is now of no value when other hydrocarbons are present.

When the oil of Pennsylvania became exhausted the oils of Ohio assumed great importance, and these were found to differ in many respects. While the oil of Pennsylvania was of a dark greenish-red of from 49 to 34 Be., it was quite mobile and rather transparent, and had no impurities, such as sulphur or other objectionable matter. The Ohio oils were found to contain large quantities of sulphur and required special treatment, and there were in them other hydrocarbons than the paraffines. Now these other hydrocarbons which correspond in boiling point with the

paraffines have different specific gravities and are usually heavier, so that a gasoline or naphtha from them of a heavier gravity, say 70 Be., might have as low an average boiling point as one from Pennsylvania oil of 76 Be. As the products of the fields of Illinois, Texas, California, Wyoming and Oklahoma came into the market in turn, it was found that these oils consisted largely of other series of hydrocarbons and that in many cases they contained an asphalt base instead of a paraffine base. Many also contained much sulphur and some contained little or no gasoline or naphtha.

These oils from the western part of the United States contain large amounts of oils of the olefine series and some of the acetylene or aromatic series. The latter, while having a different gravity from the paraffine series when of the same boiling point, are as good for rubber solvents as the paraffine hydrocarbons, and indeed often better.

In purchasing petroleum naphthas, therefore, at the present time it is not sufficient to ask for a naphtha of a certain gravity, but it must be examined and tested as to its boiling point. If the oil begins to distil too low it is rather dangerous, as it will be more inflammable; that is, the vapors given off at ordinary temperatures will ignite easily and will carry a long way from their source and will explode if they come into contact with a light or flame. If there is much of a residue which distils only at a high temperature, the solvent will be too slow in drying and the rubber dissolved in it may remain tacky. The naphthas should also be tested for their dissolving power, as it may vary widely according to the hydrocarbon series present.

Rubber manufacturers have been confronted for a number of years with constantly rising prices for naphthas, and a constantly poorer grade has been received. This situation had no connection with conditions in the rubber trade, but was due to the enormous increase in demand for gasolines for motor vehicles.

The demand created the supply, for it stimulated chemical experiment, and methods have been invented whereby the heavy oils can be "cracked" by distillation under pressure to produce light oils or gasoline, and this process is used on a very large scale. Another influence that has lowered the price of gasoline has been the discovery of oil in the "Cushing Pool" in Oklahoma, where a well was drilled a short time ago that flowed 5,000 barrels daily, which was allowed to go to waste for over a week. This and other previous like samples of criminal negligence in wasting nature's lavish resources have compelled the State of Oklahoma to make an attempt to regulate the flow and waste of oil. Gasolines have recently dropped from about 18 cents to 13 cents and even as low as 10 cents per gallon, and disturbed European conditions will lower them still further, and consumers should now insist on being furnished a suitable naphtha.

CARBON BISULPHIDE.

This excellent rubber solvent is a chemical prepared by the direct combination of carbon and sulphur under the influence of high heat, and in America almost the entire amount is made by heating by electrical means. Its solvent powers for rubber are great, and its great volatility makes it a most rapid dryer, but it also makes it a most explosive compound. When mixed with air and heated to 150 degs. C. it will explode, and cases are known where it exploded by the friction of pouring it out of a narrow glass tube. It must, therefore, be handled with great care to prevent explosions. Its boiling point is 46 degs. C. and its gravity is 1.29. It therefore weighs 10¾ pounds per gallon.

TURPENTINE AND PINE OIL.

Turpentine is not much used as a solvent because of late years it has been high-priced. But still more recently very low prices have been seen in this trade, and the outlook is for low prices

for a long time. It is, therefore, worth while considering these as solvents—particularly what are known as "Wood Turpentine" made from the dead wood. These usually have a very disagreeable odor, and this is fatal to their use when they appear in the finished goods like paints and varnishes, but where they are removed their odor can be tolerated in the workrooms with proper mechanical ventilation. Pine oil is also made from wood at the same time as turpentine, and is a less volatile compound. Both of these oils will dissolve rubber better than petroleum naphthas and as well as coal tar products, and the volatility of turpentine is just right for many purposes.

ETHER.

This is an excellent solvent, but nearly as volatile and dangerous as carbon bi-sulphide. It has only a faint, pleasant odor. It is rather expensive, selling at 18 cents per pound, but as it is made from denatured alcohol, its price may be reduced in the future.

THE NON-INFLAMMABLE SOLVENTS.

There is a large number of non-inflammable rubber solvents which are in nearly all cases compounds of chlorine with the hydrocarbons. Among them may be mentioned: Carbon tetrachloride, chloroform, di-chlor-methane, tri-chlor ethane and tetra-chlor-ethane. The chlor-ethylenes have also come on the market. These are as follows: Di-chlorethylene, boiling point 55 C.; tri-chlorethylene, boiling point 88 C., or 190 F.; tetra-chlorethylene, boiling point, 121 C., or 249 F., and specific gravity of 1.60. All the above are made in Europe and were until recently sold at about 7 cents per pound. The last one mentioned is, however, made as a by-product in the United States when making carbon tetra-chloride.

CARBON TETRA-CHLORIDE.

This is the most available non-inflammable solvent, the price recently having been 6.5 cents per pound. It is now much higher, but as it is made in this country, it will probably soon be again available. This solvent is used as a fire extinguisher, and with 60 per cent. tetra-chloride and 40 per cent. naphtha the mixed solvent will not explode or burn.

Other unflammable solvents which may soon come into use are "Dutch liquid," or ethyl chloride, C_2H_5Cl , with a specific gravity of 1.25 and boiling point of 84 degs C., and propylene chloride, C_3H_5Cl , the specific gravity of which is 1.165 and the boiling point of which is 97 degs. C. Their manufacture has been begun in this country.

Were it not for the price at which the chlorinated compounds are held, these would be universally used on account of the lessened risk in using them, compared with the hydrocarbons themselves, but they will never, perhaps, be brought down to a comparative price. When, however, the solvents can be in large part recovered, as is sometimes possible, then the additional price for the nonflammable solvents will not prohibit their use, particularly in those places where, as in a large city or in a large factory, any fire would endanger a very large amount of property.

OTHER SOLVENTS.

There are other solvents of rubber among the essential oils and balsams and oleo resins. On account of the price, however, these are seldom used, though some were formerly used in rubber mixings to make them adhesive; for example, Canada Balsam and Oregon Balsam of fir and Venice turpentine. These are all exudations of trees of the pine family.

Of the basic chemical bodies which are oils nitro-benzol may be mentioned. It has been used as a solvent for vulcanized rubber in analysis, though C. O. Weber preferred the nitro-toluol. Pyridine is also a basic body which will dissolve rubber, but Kenneth MacKenzie pointed out (Journal of Industrial and Engineering Chemistry, 1909, p. 361) that pyridine is liable to be contaminated by the hydrate which boils at 94.5 degrees C. which

does not dissolve rubber, but the pure pyridine which boils at 115 degrees C. with a specific gravity of .98 will dissolve crude rubber. C. O. Weber uses pyridine to separate asphalts, tars, etc., from the vulcanized rubber in analytical work. It might be a good accelerator, but its smell is almost unendurable.

Sulphur chloride, though not strictly a rubber solvent, is used for the cold cure. It has been described in Pearson's "Crude Rubber and Compounding Ingredients" and is familiar to all in the rubber trade.

In general those liquids which dissolve in water and not in oils are not solvents of rubber, but some of them are used for various purposes in the rubber industry. Methyl or wood alcohol will not dissolve rubber, but will dissolve resins to some extent. Ethyl or grain alcohol will dissolve most rubber resins better than wood alcohol, though the latter will dissolve shellac better, and most varnish gums can be dissolved better in these alcohols, if not raw, than after heating.

The higher alcohols, such as fusel oil, together with their esters such as amyl-acetate, will dissolve rubber quite perceptibly, but they are of no importance in the rubber industry though of great importance in the celluloid and like industries. Amyl-acetate is almost necessary in all nitrocellulose solutions to get a proper protective coating which is of the proper glassy consistency. Acetone is a better rubber resin solvent than the alcohols, but methyl and ethylacetates are still better solvents, in fact the best which will not dissolve the rubber at the same time. Many rubber solvents have not been mentioned as they are rather rare chemicals or oils of such high price that they are of no practical interest.

COAL TAR PRODUCTS FOR THE RUBBER TRADE.

THE ramifications of the rubber trade call for a wide variety of coal tar products. It might be well to consider the list of materials that are demanded by the manufacturers of various rubber goods:

BENZOL, which boils at the lowest point of all the coal tar distillates, is made in five grades.

BENZOL PURE is made water-white and refined so that 100 per cent. of it will distil within a 2-deg. C. range of the boiling point, 82 degs. C., and has a gravity of approximately .880. This material is crystallizable at freezing temperatures. It carries little in the way of impurities and a very small amount of higher boiling homologues. It is used chiefly in cements where speed of evaporation is required. It is also used as a carrier for sulphur chloride, sometimes alone, and at others mixed 50 per cent. with carbon tetra-chloride. There is a small percentage of sulphur compounds in the way of impurities, and certain sources of crude will yield a small amount of carbon-bisulphide in the resultant benzol. Of late there has been a demand for benzol free from these compounds.

100 PER CENT. BENZOL is water-white and refined to a similar degree as the preceding, except that higher boiling homologues are present in sufficient quantity to elevate the boiling point so that 100 per cent. will distil at 100 degs. C. It is used in about the same way as pure benzol.

90 PER CENT. BENZOL is the grade that is used most by the trade. This material is water-white, of good odor and very strong in solvent power. It is fast in evaporation and will cut rubber, rosin, gum, etc., with considerable speed. This enters into a wide variety of cements, particularly pure Pará. It has been used for "wiping off" in tire building, but as a usual thing the low cost of petroleum products precludes this.

50 PER CENT. BENZOL is similar to the preceding grades, but slower in evaporation because the boiling point is now elevated so that only 50 per cent. will distil at 100 degs. C. It is seldom used in the trade except in a few special cements where a certain drying time is required.

STRAW COLOR BENZOL is a grade of benzol comparable to 90 per cent., except that it is not refined enough to be water-white. It is used where the fact that it is pale yellow in color and rather stronger in odor than the water-white makes no difference. The coal tar solvents are higher in price than the petroleum naphthas, but they have better solvent powers, and in many cases superior evaporative qualities. For these reasons they are employed for many special purposes where the petroleum products are not suitable.

PURE TOLUOL is a water-white distillate boiling within 2 degs. of 110 degs. C. This would have similar properties to all the preceding benzols, but its high comparative cost precludes its use.

COMMERCIAL TOLUOL is water-white, boiling 90 per cent. at 120 degs. C., and of similar solvent power, but still slower evaporation. It is used only in tire doughs and such compounds where slow drying is required.

STRAW-COLORED TOLUOL is similar to commercial toluol except that the process of refining has not removed sufficient impurities to make it water-white in color. It is used when color and odor make little or no difference.

XYLOL is never used in the pure state by rubber manufacturers.

SOLVENT NAPHTHA is really Commercial Xylol—a refined water-white solvent, sometimes called "160-deg. Benzol" and "Rubber-maker's Naphtha." This is used for cements where slow drying is required. It is strong in solvent power; has a good odor and a fairly high flash point—78 degs. F. It is a similar grade to the coal tar naphtha used so much in England for spreading. It also enters very largely into the varnishes used in coating rubber goods, shoes, boots, etc.

HEAVY NAPHTHA has been used in insulating work and also in the preparation of packing and stuffing compound when used along with asbestos, fillers and other bitumens.

CREOSOTE OILS have been used as preservatives for ducking when they have a small percentage of carbolic acid present. They have been suggested for reclaiming purposes, but it is believed their wide variation in manufacture, due to change in source, would require an expensive treatment to insure uniformity.

CARBOLIC ACID is used somewhat as a preservative for duck and also in reclaiming. This process is now used with considerable success and is covered by patent No. 722,944, March 17, 1903, issued to Joseph Chautard and Henri Kessler, and United States Patent No. 774,727, November 8, 1904, issued to Ludwig T. Petersen. Cresylic Acid, often called "Crude Carbolic Acid," is utilized in a similar way.

REFINED TAR is simply a coal tar that has been distilled sufficiently to remove lighter hydrocarbons and excess of oils. It is added to reclaimed stock and shoddy to impart a kind of oily consistency and tarry odor.

NAPHTHALINE is made in a wide variety of refined crystals. The chief demand by rubber manufacturers is for white flake. This is used as a preservative and also for reclaiming. The process is, however, covered by a patent.

PITCHES, the solid residues of coal tar distillation, are used somewhat in compounding. It is extraordinary that these materials have not found more vogue in the trade, as they are hard, black, binding bitumens that can be easily made hard or soft as required. They are very cheap and easily obtainable. They melt well and will take up a large amount of loading material.

NOTE.—Gravity in coal tar distillates is unimportant as all are in the range of .880 to 1.04 and they do not vary in accordance with boiling point as in case of petroleum.

The Globe Tire & Rubber Co., Inc., has been organized at Philadelphia to take over the tire business of the Meeley Rubber Co., at 660 North Broad street. F. W. Darlington is president of the new concern, J. V. Harrigan and R. J. Skilton retaining their respective offices of vice-president and secretary-treasurer.

A NEW RUBBER AND ASBESTOS COMPOUND.

By John F. Green.

MANY attempts have been made looking to a compound of rubber and asbestos and the writer in pursuing his research of asbestos, both in the chrysotile and amphibole varieties, discovered that in external appearance and in chemical composition they are very much alike, and that the heat-resisting property of both these varieties of asbestos is approximately the same. But because of the condition of the fibre the amphibole is the best resistant to acid. The analysis of asbestos gives as component parts silica, magnesia, ferrous oxide, alumina and water, and the difficulty in the past to find greater uses for asbestos lay in the fact that for electrical and other uses the magnesia and ferrous oxide were found to be detrimental. The removal of the magnesia and ferrous oxide, however, gives what has been named "fibrous quartz," and this material has been spun into a thread, inducted into porcelain, made into paper and other uses; and the writer was asked to induct it into rubber—which has been done in all grades of rubber, and as high as 95 per cent. asbestos has been used experimentally.

It was discovered that vulcanization could be had at a lower temperature than that formerly used, that asbestos gave a greater heat resistance to the compound, and as we were inducting a silica with the compound we were getting a very hard material and one that would stand a great amount of hard usage. This fibrous quartz is non-carbonizing, impervious to acid, and is practically indestructible. Compounds made of low grades of rubber have been surprising in their results. No better adulteration can be found than fibrous quartz. Its utility, in addition to the other qualities named, gives this material a unique position in the commercial world.

The compound can be made of different per cents. of both ingredients to suit the requirements, but the compound thus far found best for common use is 75 per cent. fibrous quartz and 25 per cent. rubber.

In using asbestos as heretofore the 40 per cent. of magnesia going into the compound was a detrimental factor, electrically and in other ways, and results were not satisfactory. Besides, there were found more or less grit and sand in fine particles. All these objections are removed by the process employed to get the material known as fibrous quartz.

In all rubber manufactures, especially hard or semi-hard material, the product can be greatly improved by compounding with fibrous quartz, besides reducing the cost of production, and it will enable the product to find more channels commercially. The writer at present is engaged in experiments for a superior rubber for heavy truck tires, and for a compound that will resist acid for washing machines or wringing machines. He is also looking to a time when by these methods vulcanization will be greatly simplified, in fact, attained by friction—as in some of the experiments the compound under consideration was so tough that increased power was put on the machine and a scintillation of frictional vulcanization was observed.

REDUCED COST OF CEYLON RUBBER.

The annual report of the British Colonial office on Ceylon shows exports of rubber as follows: 1910, 1,698 tons; 1911, 3,060 tons; 1912, 6,628 tons, and 1913, 11,325 tons. Nine years ago the exports amounted to only 34 tons. In 1913, the United Kingdom took 55.38 per cent. of the total and the United States 23.89 per cent. The average value in 1912 represented \$1.77 per pound and in 1913, 80 cents. The relatively low cost of rubber production in Ceylon is referred to as permitting a satisfactory profit at prices now ruling. Recent railway extension will serve one of the richest rubber districts in Ceylon.

Some Interesting Letters From Our Readers.

TWO TIMELY LETTERS FROM THE FAR EAST.

DUTCH PLANTERS WANT TO SHIP DIRECT TO THE UNITED STATES.

THE following letter has been received from a large rubber house in Rotterdam which distributes the product of a number of rubber estates in the Dutch East Indies. These dealers are very anxious to make an entry into the American rubber market and their letter cannot fail to interest American importers and manufacturers. They write:

The reason why we take the liberty of approaching you is the following:

One of our firm is the manager of some of the best known rubber growing companies in our colonies, the Dutch East Indies. In this way we have the sale of the product of 5 estates in Sumatra and one in Java, and although these estates are still very young we are bringing more and more rubber on the market.

Since the British Government has declared rubber contraband our steamers are discharging their rubber in England or in France, and in order to escape the seizing of our product we will have to hold the rubber back in the Indies, or we will have to ship it to England or the United States.

England offers us the advantage of being near by, but we are considering whether the United States would not offer us a better outlet. There are advantages such as the facts that your country is the largest buyer of rubber, that direct shipment would save freight and insurance premiums, etc.

However, we know the English market, but we know nothing of that in the United States; and we would feel much indebted to you if you could give us some elucidations: if you would tell us whether plantation rubber is sold to the consumers by importers, or agents of English houses, through the medium of brokers, or how. Does there exist such a thing as a rubber market or rubber sale? And what are the expenses, import duty, storage expenses, brokerage, etc?

After England the Dutch people are the largest rubber growers, and we have dozens of companies, which are established here but are working in Java or Sumatra, that are in the same position we are in.

If the war is going to last long, as it most probably will, the Dutch companies will have to do one thing or the other, because, as set forth above, the rubber can no more reach the Rotterdam and the Amsterdam markets.

We have quite a number to suggest the idea of establishing an office in the United States for joint account of our companies, to sell our rubber direct, and we have considered the possibility that the Americans might work hand in hand with us to get a monopoly of the market, but we are afraid of taking the risk.

We would appreciate it if you would consider the above and give us your answer.

JOHN J. HARRIS, COMMANDER IN CHIEF, OF SCOUTS.
DEAR SIR:—I have the honor to acknowledge the receipt of your letter of the 29th inst. and in reply to inform you that the situation in the Far East is such that it is impossible for us to send a letter, such as you require, by the ordinary means. It is written in pencil, on a crowded sheet of paper (the camp stock of stationery being exhausted), and is not a very good specimen of the first class of writing. It is, however, for service in the British army. His letter is as follows:

I have been here in command of a post of cyclist scouts since

the war broke out, and have had no time to attend to business—in fact there has been no business to attend to. As I am a relic of the South African War (Strathcona's Horse—Canadians, you know), I was at once put on the first job going here. I volunteered for home at once, but no one is being sent from here yet, on account of climate, etc.

I have not seen THE INDIA RUBBER WORLD for nearly three months, and feel quite out of touch with your end of the game in the present state of affairs.

There is now the chance of a lifetime for American firms to buy rubber direct here in Singapore, and to establish direct relations with the center of production. Rubber was selling here at first (August) at 1s. to 1s. 6d. per pound—prime smoked sheet—but no orders could be obtained from anywhere. Where were your manufacturers? If they had had agents here they would have had the chance of a lifetime to lay in stocks on the ground floor.

I have been trying to persuade several American firms to start in to do business here direct, but they do not yet seem to grasp the definite limits of the local conditions. All rubber is sold here for spot cash, as estates send their rubber down here to obtain immediate money to carry on with, and any market that is established here will be on a direct cash basis—credits must be sent with orders. There is no money, and no credit to be obtained locally.

The Malay peninsula has exported from January 1 to August 31, 28,570 tons of plantation rubber and may be credited with 45,000 tons for the year. Ceylon will do about 15,000 tons, and the rest of the Middle East about 6,000 tons, or so, making a total of some 66,000 tons probable for this year.

TO THE EDITOR OF THE INDIA RUBBER WORLD, DEAR SIR:

We enclose for your inspection part of an issue of "The Waste Trade World," published in London. You will note that the article is copied word for word from your October issue. (The article referred to is the "Review of the Rubber Scrap Market," which filled about two-thirds of a page in THE INDIA RUBBER WORLD.)

Our grievance is that the London paper is not issued and sold exclusively to the trade, but is to be had by any Tom, Dick or Harry who cares to spend one penny.

We, as subscribers to your esteemed journal, also being wholesale merchants, trust this will have your kind attention, as we can assure you that the London paper is far from being popular with all our friends.

E. R. W.

England, October 29, 1914.

TO THE EDITOR OF THE INDIA RUBBER WORLD, DEAR SIR:

In your November number, page 115, you say that complaints have been received that Chinese rubber shoes are not worth as much as American rubber shoes for reclaiming.

There must have been a radical change in the last few years, for when I superintended the output of 4,000 pairs of Chinese shoes a day in Great Britain, this trade, along with the Turkish trade, demanded better stocks than the home trade, and it was understood that what would do for the home trade would not suit the Eastern market.

R. E. HOTCHKISS.

November 10, 1914.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

New Rubber Goods in the Market.

A MACKINTOSH CAPE FOR MEN.

TWO views are here shown of the Hussar cape for men, a style popular in Europe but which has not until quite recently been made in this country. Its introduction here has been well received. It is made either in Mackintosh material or Cravenetted tweed and combines novelty with service and practicability. [The N. Y. Mackintosh Co., Mamaroneck, New York.]

A NEW GARTER FOR MEN.

A new garter for masculine use has recently come on the market that consists of an elastic silk strap to go around the leg, equipped with various fittings that are either made of ivory or of such a good imitation as to be indistinguishable from it. From this fact it gets its name, the "Ivory" garter. Its distinctive feature lies, however, in the method of catching and holding the stocking. There is a tongue, finished with a soft, corrugated rubber tip, that fits into a clasp. When the stocking is laid over this tip and the tongue pushed through the clasp the rubber tip holds the stocking absolutely and at the same time, being soft, avoids any tearing tendency. [Ivory Garter Co., New Orleans, Louisiana.]

AN AMBULATORY SPLINT WITH PNEUMATIC CUSHIONS.

Persons who have never suffered broken or fractured limbs or dislocated joints can scarcely appreciate the discomfort and inconvenience that often arise from these injuries, aside from the suffering they cause. One result of an accident of this nature might be, for instance, the shortening of the limb. To prevent such deformities and to promote as far as possible the comfort of the patient, a new form of splint has been devised, an illustration of which is shown. It is made of light, seamless steel tubes, with pads of webbing and flannel containing air cushions of rubber. These cushions enable the splint to be applied without pain. It is stated that this form of splint allows the patient to move and in bed, to sit up or to walk about at once; that it retains the broken bones in proper position, and permits frequent inspection of the injured member. [E. S. Betz, Hammond, Indiana.]

A MOTORCYCLE AMBULANCE WITH WATER-PROOF COVERING.

Not the least interesting of the inventions which the necessities of the present war have brought into being is the ambulance being used in the British army's hospital corps. A side stretcher with a third wheel is attached to the motorcycle. This stretcher is supplied with waterproof coverings to protect the wounded soldiers from the storms, and will accommodate two persons. Hundreds of these outfits are said to be in use, the high speed at which they can be operated being a feature of great advantage.

THE ABFOOT HOT WATER BOTTLE.

The hot water bottle shown in the accompanying illustration is a new type that has just come on the market. It is made of cloth-insertion chocolate colored rubber, and is considerably larger than the ordinary hot water bottle, measuring 18 x 8 inches, and will hold enough water to retain heat for a long period. One important feature of this bottle is the stays situated at regular intervals to prevent bulging and to maintain an even, flat surface. Another is the detachable strap arrangement by which the bottle may be secured to the body if desired. Or, by use of this strap the bottle may be attached across the foot of the bed, to serve as a foot warmer. The stopper is in the corner of the bottle, where it will cause no discomfort or inconvenience to the user, and the heating surface being unusually large, one bottle will ordinarily be found sufficient to provide the necessary warmth. [The Hospital Supply Co., 53-54 4th Avenue, New York.]

THE "MERMAID" BATH-TUB SYRINGE.

From the illustration it will be noted that the Mermaid syringe is intended for attachment to the faucet of the bath-tub. It is made entirely of rubber, from the soft rubber cup which slips over the faucet and the two and a half yards of red rubber tubing to the patented hard rubber medicating chamber and douche point. [Mermaid Specialty Co., 1416 Broadway, New York.]

THE KANGAROO ARCH SUPPORTER.

This is a scientific appliance for the support of fallen arches and is a distinct innovation in the field of arch supporters, being worn on the outside of the shank of the shoe, under the arch of the foot. The device for attaching it to the shoe is simple and practical. It consists of two clips nailed to the bottom of the shoe and two flanges projecting from the metallic anchors vulcanized into the supporter. When attached it has the appearance of being cemented to the shoe. It can be attached or detached in a moment, permitting one pair of supporters to be used on several pairs of shoes. It is made of rubber, is light, 5 ft. flexible, elastic and yielding, and permits the arch of the foot to rise and fall naturally. [The Dr. Neal Co., Portsmouth, New Hampshire.]

THE "WONPEACE" RING CUSHION.

The B. F. Goodrich Co., of Akron, Ohio, is making a new line of molded ring cushions, under the trade name "Wonpeace." This cushion is chocolate colored, all-rubber, absolutely without seam, has smooth surface and heavily reinforced edges.

A ROUND BALATA BELT.

Under the trade name "Dickbelt," R. & J. Dick, Limited, of Glasgow, Scotland, and Passaic, New Jersey—the makers of Dick's Original balata, gutta percha and canvas belting—are putting out a new line of round balata belting. This new belt is about three-eighths of an inch in diameter and is suitable for use

on sewing machines, certain kinds of washing machines, motor-cycles, in cash conveying systems in stores, on trolley cars for shifting the pole over the car, and for various other purposes.

BRUSH FOR APPLYING LIQUID POLISH.

The accompanying drawing shows the top and neck of a bottle—which may be either of glass or of metal—over which has been drawn a conical piece—or nipple—of rubber sufficiently pliable to fit closely over the top of the bottle. The extended end of this rubber cone has a back of sufficient thickness to give it stiffness, and at the same time thin enough to yield under pressure. The other half of this rubber cone is of softer consistency. A brush of horseshoe shape with a semicircle of bristles an inch and a half long is attached at the end. The purpose of this invention is to provide a quick and economical way of spreading polish either on a metal or leather surface. It may be used for automobile parts or for shoes. When it is applied the liquid polish in the bottle runs down into the cone and the pressure of the bristles on the surface to be polished forces the rubber cone backwards enough to open a small vent in the center of the bristles, through which the liquid feeds. [L. W. Bullard, Cumberland, Maryland.]

UMBILICAL TRUSSES.

Below are shown illustrations of two new umbilical trusses, the first of which is made with a pad of sponge rubber, soft and comfortable to the flesh, and so arranged that it will not slip, also that it may readily be cleansed with soap and water.

The other, known as the "Walco," is made of double width elastic webbing with non-elastic straps in front, fastened to studs upon a polished hard rubber pad. It has soft leather trimmings and connections. Both are in adult size.

THE "OLIVA" SLEEPING BLANKET.

These two cuts illustrate a new style of sleeping bag, which is claimed to possess several advantages over the styles that have hitherto been on the market. One of these advantages is that it

has three thicknesses of material over the wearer, affording ample warmth, while another is that it can be thrown open in a

moment, as it is so shaped that it remains in position without the use of restricting fastenings, with the exception of the snap

fastening near the feet. Made of waterproof material, it is offered as especially suitable for use in field hospitals and hospital ships, as well as for those engaged in active service. [Mrs. Oliver, 39 Old Bond street, W., London.]

FOR LIFTING MICROSCOPIC COVER GLASSES.

A contributor to a London pharmaceutical journal describes a device which he employs for lifting the very thin microscopical cover glasses used in his research work. This utensil is shown in the accompanying drawing. It consists of a short brass tube in diameter about equal to a lead pencil, on the lower end of which is a flat brass plate with an opening in the centre, and attached to the upper end of which is a rubber bulb, such as is used on the ordinary medicine dropper or fountain pen filler. To lift one of these delicate glasses it is necessary simply to moisten the surface of the brass plate, press the rubber bulb, then press the plate upon the glass cover. The suction holds it in place. It can be released, of course, by again pressing the bulb.

A WATCH CASE ATOMIZER.

This instrument is a complete and efficient pocket atomizer, suitable for spraying the nose and throat. It is made entirely of hard rubber, in the size and form of a watch case, and can be conveniently carried in the vest pocket, filled and ready for use; thus enabling sufferers from catarrh and similar afflictions to apply antiseptic spray at frequent and regular intervals. It has a screw-on cap, and is easily cleaned; is made in two styles—with fine spray for thin fluids and with coarse spray for thick fluids or oils—and is said to have the approval of the medical profession. [American Hard Rubber Company, 11 Mercer street, New York.]

A SHAMPOO APRON.

Who has not experienced the disagreeable sensation, when indulging in an otherwise invigorating shampoo, of having water trickle down the neck? A rubber apron is now made which will prevent this annoying condition. This apron resembles a child's bib, but it fastens up closely around the neck, having a couple of snap fastenings so that it will fit different necks. It is made in several sizes, from 19 x 22 inches to 27 x 35 inches. [Bailey Rubber Co., Boston.]

A NEW INNER TUBE BY GUSTAVE KUSH.

Mr. Gustave Kush, of New York, the well known manufacturer of mechanical rubber goods, has invented an inner tube which certainly is unique and original. The first of the two accompanying illustrations shows this tube placed in the casing and only sufficiently inflated to hold its natural shape. It will be noticed that at the tread there are three longitudinal ribs, very much wider at the top than at their base. When the inner tube is fully inflated it assumes the shape shown in figure No. 2, where it will be seen that the

ribs overlap and form several chambers in which the air becomes compressed when the tube is inflated. This inner tube weighs about one-third more than the ordinary kind, but it will be possible with this tube to use a casing about 25 per cent. thinner than the usual casing.

It is obvious at a glance that this tube makes the tire much less liable to puncture than the ordinary tube which has the same thickness at all points. In addition to this merit Mr. Kush claims that by reason of the compressed air caught between the ribs and the decreased thickness of casing required the tire becomes more resilient. His further contentions are that there is no pinching or friction between the tube and the casing, and much less liability to over-heating. He believes, further, that with this tube pneumatic tires can be used on heavy trucks in place of solid tires to great advantage and with much economy. [Gustave Kusk, 61 Beekman street, New York.]

THE COATS RESILIENT WHEEL.

Many tires have been designed with the object of eliminating the pneumatic tube feature and preserving the resiliency, but the Coats wheel preserves the pneumatic cushion effect in a novel manner by distributing the air in six pneumatic bags placed around the hub. As shown in the illustration, each of these air bags is a circular cushion, placed between the hub and the rim. The rings are inflated simultaneously from an air valve near the center of the wheel, and are inter-connected by flexible tubes so that a road shock on one is distributed among the six. The rings are enclosed by cover plates on the sides of the wheel and are thus protected from oil, moisture and light. Should one of the cushions become deflated, the wheel could still be used, or the cushion replaced in a few minutes. Since the cushions do not come in contact with the road, they are not subjected to wear. The rim is made in S. A. E. standard sizes and will take standard solid tires. [American Motor Wheel Co., Crawfordsville, Indiana.]

A PNEUMATIC TIRE WHERE IT CANNOT BE PUNCTURED.

A Louisville company has put a combination wheel and tire on the market of such a character that the tire, while pneumatic, is not subject to puncture, because it is far removed from where any puncture is possible. The wheel has a solid rubber tire. It also has a cushioned hub, consisting of an inner and an outer circle; and between these there is inserted an annular inflated cushion which, as a matter of fact, is a small size pneumatic tire, but, being placed where it is, it is immune from the accidents that befall the pneumatic tire in its usual place around the rim. The accompanying illustration shows the location of this new pneumatic. [Pneumatic Hub-Tire-Wheel Co., Louisville, Kentucky.]

THE SHERRIN-DIAMANT TIRE.

An innovation in the construction of solid rubber tires is presented in the Sherrin-Diamant tire illustrated herewith.

From external appearances it seems to be of about the same construction as the average solid tire, although it is said to combine the resiliency of a pneumatic with the advantage of being puncture proof. The inside is hollow and the lower edges set in the rim of the wheel in the ordinary manner. There are two ribs on the inside extending around the tire, and these are laced together by a raw hide thong, which supports the lateral walls but allows sufficient resiliency to take up the road

shocks. [The Sherrin-Diamant Tyre Syndicate, 10 Copthall avenue, London, England.]

THE "NO-STRETCH" TIRE BOOT.

A new type of tire boot, known as the K. C. "No-Stretch," has been introduced in the West. This boot is built on a core the exact shape of a tire, in quarter-inch sizes, so as to fit non-skid tires, and in both hook-on and lace-on styles. It is constructed of two inner layers of rubberized tire fabric and an outside layer of leather. The no-stretch feature is the result of the use of the rubberized fabric, which resists the action of water, while the studded leather cover supplies wearing quality. It is guaranteed by the manufacturers to give 2,000 miles service. [Western Tire & Rubber Co., Kansas City, Missouri.]

Some New English Rubber Goods.

THE Editor during his recent visit to England ran across a number of rubber articles which have lately come on the English market, but which as yet have not found their way, at least in any considerable quantity, across the water.

RUBBER SHOES FOR GOLFERS.

The accompanying illustration shows a pair of rubber shoes made especially for golfers, for in England and Scotland at least weather is no bar to golfing, and the game is pursued

ENGLISH RUBBERS FOR GOLFERS.

ardently even under dampening conditions. It will be noticed that these rubbers have steel studs in the bottom so as to render them anti-skid on slippery links. Another noticeable feature is the strap going over the instep of the foot, holding the rubbers firmly in place even when one is walking over soggy ground which has a tendency to pull them off. They are worn over any kind of leather shoes.

A RUBBER COVER FOR THE TOOTH BRUSH.

No one on packing his grip after spending a pleasant week-end likes to throw a wet tooth brush in with his collars and other accoutrement which it is desirable to keep dry. This little rubberized case solves the problem. The moist brush is inserted, the end clasped together, and no harm is done to the neighboring articles.

A WATERPROOF TOOTH BRUSH CASE.

A TEE THAT POINTS THE WAY.

The ordinary tee serves no real purpose except to place the ball on, so as to give it a clean, square blow; but the indicator tee which is here illustrated serves an additional purpose. It has a long pointer which indicates the proper direction for the stroke. It will be noted that the tee is fastened by a staple which is pushed into the ground, thus keeping the tee in position.

THE INDICATOR TEE.

A SWIFT AND UNTIRING SWIMMER.

Some rubber toys are so simple in their mechanism that everybody has made them without being able to get the idea

himself, but here is one of quite a different color, and on seeing it perform its functions one marvels at the human ingenuity that devised it. It is in the form of a little rubber figure, made hollow and so constructed that when in repose the arms and legs are folded up close together as in the left hand position in the accompanying illustration. To this little hollow figure there is attached, as a sort of caudal appendage, a long but slender rubber tube with a rubber bulb on the end. When the figure is put in the water its specific gravity is such that it floats with

A RUBBER SWIMMER THAT REALLY SWIMS.

the head out of the water and the body submerged. A pressure on the bulb straightens the arms and legs as in the second pose in the illustration, and makes a perfect swimmer's stroke, so that the little figure darts ahead in the water with every pressure. To add to its realism it is clad in the conventional bathing suit. It is a droll device and affords infinite amusement.

A PNEUMATIC NOISE MAKER.

There are a great many people who think that there is too much noise in the world already, but that attitude simply argues advancing years. To the youthful mind there cannot be too much noise, and any addition to the existing sum is ardently welcomed. Here is a habit nee out of an English "Cracker," which is a device for making explosive sounds inexpensively and indefinitely. The two hemispheres shown in the picture are made of soft rubber. The flat surface where

A RUBBER CRACKER.

the two come together is made of wood or metal with a hole in the center. When a piece of paper is put over this hole and the two sides brought together by closing up the handle, and then either side of the completed sphere is struck against a wall or a table, or any hard substance, the pneumatic pressure breaks the paper with a loud explosion.

A SHILLING GOLF BALL.

While in England recently the editor picked up a golf ball which is sold there for a shilling and called the "Sunbeam." This was not a re-made, but a new ball. Its cover was white as snow and very hard. The ball was a non-floater and flew well. At first it sounded a bit like the old "guttie," but seemed to loosen up after a little. Under the dissecting knife the interior proved to be a large ball of rubber substitute, wound with rubber tape, the cover being apparently of a celluloid compound.

New Machines and Appliances.

LANDIN'S FABRIC FEED FOR SPREADERS.

THIS is an ordinary spreader equipped with a device for feeding the fabric. This consists of an apron having hooks at one end and a clamping plate at the other, and is run by a pair of sprocket chains, into which the hooks catch.

In the drawing, *A* is the let off, *B* the wind-up, and *C* the spreading roll, driven in the usual manner. On each side of the

LANDIN'S FABRIC FEED FOR SPREADERS.

spreader is a sprocket chain *D* for engaging the apron to convey it through the machine to the wind-up. The apron is built up in the form of a pad, having two outer layers of canvas and a middle layer of felt. It is as wide as the fabric *E* and long enough to lap once or twice around the wind-up, forming a smooth cushion for the coated fabric. The apron is stretched between the chains and is not shown in the drawing.

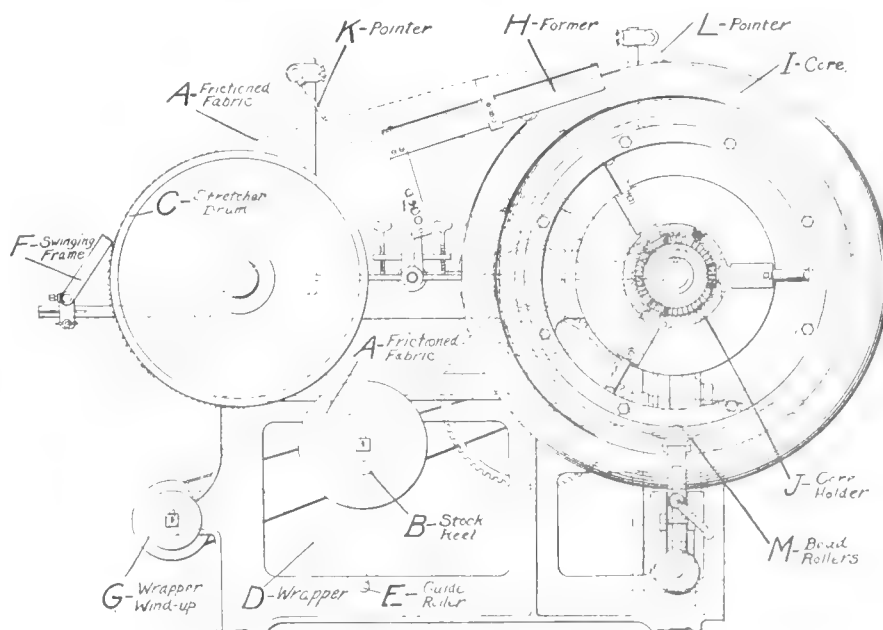

On the rear end of the apron is a narrow metal clamping plate to which the fabric may be quickly and smoothly attached. On its forward end is another metal plate *F*, curved to fit the wind-up roll. On each end of this plate is a hook for attaching the apron to the chains *D*, and in the center is another hook *G* which catches on one of a series of rods in the center of the roll *B* when the apron reaches this point.

The operation is as follows: The forward end of the apron is hooked to the chains and the rear end is clamped to the fabric. The spreading knife is raised and the machine set in motion. When the rear end of the apron has passed the roll *C* the knife is lowered and spreading begins. When the plate *F* reaches the wind-up it is automatically disengaged from the chains; the hook *G* catches one of the rods in the center of the roll *B*; the apron and fabric are then wound up in the usual manner. Invented by C. J. Landin, and assigned to the Clifton Manufacturing Co., Boston.

THE CONVERSE-KRESS TIRE MACHINE.

AMONG the new machines of the month is one for building tire casings. Its salient parts are a tire core and jack, a stretcher drum, a former for shaping the frictioned fabric to the core, and a pair of adjustable head rollers, all mounted on a frame.

Referring to the drawing, the bias frictioned fabric *A* is passed from the stock reel *B* around the stretcher drum *C*. The mesh wrapper *D* passes from the stock reel under a guide roller *E* but is again brought against the frictioned strip and passes part way around the drum with it, forming a brake to prevent it from being unwound too fast. The wrapper then goes over a swinging frame *F* and is wound up on a reel *G*. From the drum the fabric passes over a former *H* and is attached to the tire core *I*. The core, mounted on the holder *J*, is geared to travel 15 per cent. faster than the drum, to give the fabric strip a uniform stretch. The former *H* is shaped like an inverted U and has curved edges which turn up the edges of the strip to shape them for taking the beads. Above the frame are two pointers *K* and *L*, under which the center line of the strip passes, serving as a guide to keep the winding in line. A center line for this purpose may be marked on the strip as it is wound on the stock reel, so that the line will come on the upper surface of the fabric as it is unwound in the process of building up the tire.

THE CONVERSE-KRESS TIRE MACHINE.

After the required number of plies are laid on the core the beads are applied and rolled into place by the adjustable, concave, horizontal rollers *M*. The machine is patented by F. B. Converse and F. A. Kress, and assigned to The B. F. Goodrich Co., of New York.

THE TYLER-NALL TIRE BEAD MACHINE.

TIRE beads are usually made by hand. That is, the cores are formed by a tubing machine and afterwards covered with frictional fabric by hand. In the accompanying drawing is shown a machine for doing the cementing, covering, etc. It takes the bead core from a supply reel, feeds it through trimming rolls, through a cement tank, and then through a long drying cylinder. The strip of frictioned fabric is then folded longitudinally around it by a series of guide plates and rollers.

In the side elevation shown, the upper drawing is the right end, and the lower drawing the left end of the machine. From the supply reel *A* the core *B* passes over a guide roller *C*, through a guide plate *D*, and between trimming rollers *E*, where the surplus rubber is trimmed away. It then goes through a guide plate *F* and between roughing rolls *G* which prepare it for receiving a coating of cement. The core is passed between feed rollers *H* and through a tank *I* where it receives a coating of cement. From the tank it passes under a guide roller *J* and through a long, steam-jacketed drying cylinder *K*. Here the drying is hastened by forcing compressed air into the cylinder. From the dryer the core passes under a guide roller *L* and between rollers *M*, where it is brought in contact with the center of the upper surface of the strip of frictioned fabric *N* from the supply reel *O*, the muslin wrapper being wound up at *P*.

The core and fabric then pass through folding plates *Q*, rollers *R*, folding plates *S* and rollers *T*, which wrap the strip completely around the core and press it down firmly. The completed tire bead then passes between feed rollers *U* and away from

the machine. The various feed rollers, trimmers and folding rollers are driven through a sprocket chain *V* running the entire length of the machine, and belts *W*, from an electric motor *X*

suspended by hangers under the frame. All driven parts are geared to feed the core at the same speed.

This machine is the invention of W. C. Tyler and E. Nall, who have assigned it to The Goodyear Tire & Rubber Co., Akron, Ohio.

GRAY'S SOLID TIRE MACHINE.

BUILDING up solid tires from sheeted rubber direct from one calender is not new. Building from two calenders, however, as illustrated herewith, of different qualities of rubber, is new and interesting, and is described below.

GRAY'S SOLID TIRE MACHINE.

The apparatus begins with a revolving drum holding the rim on which the tire is built. This is mounted on a swinging arm set between two calenders. The rim is pressed first against the lower roll of one calender and then against that of the second, and is built up in plies of two different compounds, sheeted and trimmed into a strip of the required width.

In the drawing, *A* is the first calender, in which the sheet *B* is produced for forming the base of the tire; the feed being at *J*. The rim *C* is mounted on the drum *D*, carried on the swinging arm *E*. The lower end of the arm is pivoted in a block *F* which slides in a groove in the floor. To hold the rim against the lower calender roll with sufficient pressure, a cord *G* carrying weights *H* is attached to the arm *E*. Back of the lower calender roll are two circular cutters *I* for trimming the sheet *B* into a strip of the required width. The machine is operated as follows:

The rim is swung over against the lower roll of the first calender *A* and is revolved by frictional contact with it, being held in this position by the weighted cord until the base of the tire is built up to the required thickness.

Where another quality of rubber is to be used in the tread, the arm *E* is swung over, bringing the rim with the partly-built tire against the lower roll of a second calender *K*. This is constructed exactly like the first machine, and the tread is built up in the same manner. In case more than two qualities of rubber are to be used, the drum is brought in front of other calenders by sliding the block *F* along the groove in the floor. The process is repeated until the whole tire is built up.

This is the invention of C. H. Gray, of the India Rubber, Gutta Percha & Telegraph Works, Silvertown, England.

William R. Perrin Co., with offices in Chicago, and factories at Argyle, Illinois, is putting a new type of vacuum dryer on the market. This company since the death of the late Mr. Perrin has been managed by Mr. Charles Johnson, its secretary.

YOUNG'S GRAVITOMETER.

THIS is a direct reading specific gravity balance for solids, liquids, pigments or other finely divided materials insoluble in water. The instrument is so designed as to eliminate all weighings and calculations, one balancing only being necessary for the determination of a gravity.

The operation of the balance for the determination of the gravity of a solid is as follows: With the balance leveled by

FIG. 1.

means of the thumb screw in the base, the sample to be tested is suspended on the hook or needle point and the weight moved to the position which will influence the pointer to register at 0° (infinity) on the scale. (Fig. 1.)

A beaker of distilled water is then placed on the swinging shelf which is brought into

position to allow the sample to be fully immersed, making sure that no air bubbles adhere to the sample. The pointer will then indicate the gravity of the sample to well within one per cent., whether the sample be heavier or lighter than water. (Fig. 2.)

In the determination of the gravity of liquids a sinker is used and the liquid gravity is read on a scale on the reverse side from the solid gravity scale.

For the determination of the gravity of pigments a receptacle is provided which is suspended in the place of the hook, and the operation is the same as with solids except for the use of a counterweight.

The "Gravimeter," which is now on the market, is the invention of Philip E. Young, of the Acushnet Process Co., New Bedford, Massachusetts, and full particulars may be obtained from him or from Emerson & Amend, of New York.

This balance is specially adapted for the rubber manufacturer, it being possible to determine accurately and quickly the gravities of all his products.

FIG. 2.

GRINDER FOR STRENGTH TEST RUBBER SAMPLES.

A NEW machine shown in the accompanying illustration has been gotten out for the purpose of preparing samples of rubber of a perfectly uniform cross section throughout the sample when the same are to be used for tests for tensile strength. This machine was designed primarily for the purpose of grinding the

rubber backing off of samples of rubber lining to hose before the lining was tested for breaking strength.

In preparing a sample of hose lining for test, a section of hose several inches in length is slitted along its length, and the interior lining with rubber backing is stripped from the fabric. This strip of rubber is cut to a uniform width of one inch throughout a distance of three or four inches along the middle of its length. The strip is then strapped closely to the platen of the grinder, and is quickly and firmly placed in position by the eccentric rolls shown in the cut. The strip is placed with the smooth side to the platen, leaving uppermost the rough side composed of the rubber backing to be ground off from the lining.

By means of the longitudinal, vertical and cross adjustments of the platen of this grinder, the sample may be quickly ground down to an absolutely uniform thickness throughout the entire length of the test section. This machine requires less than $\frac{1}{4}$ horse power for its operation, and is made up either as shown in the cut, or fitted with directly connected motor drive. [Emerson Apparatus Co., 251 Causeway street, Boston.]

OTHER MACHINES OF THE MONTH.

A new machine for wrapping strips of paper around finished tires consist of a horizontal, hollow, annular shuttle into which the paper strip is inserted in folds, thus eliminating the usual bobbin. The shuttle and tire revolve at right angles to each other, the strip being withdrawn from the interior of the shuttle as it is wrapped around the tire. [C. Kuentzel, assignor to The Goodyear Tire & Rubber Co., Akron, Ohio.]

Another new machine automatically cuts a sheet of rubber into strips with skived edges for making inner tubes. The calendered sheet is carried by an endless belt forming a moving table, under a series of circular cutters. These are set at an angle and slit the sheet into strips with skived edges, which are afterward cemented together to form the tubes. [E. Nall and W. C. Tyler, assignors to The Goodyear Tire & Rubber Co., Akron, Ohio.]

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

COTTON NOTES.

LARGE INCREASE OF COTTON EXPORTS IN 25 YEARS.

OFFICIAL statistics of the United States exports for 25 years show that cotton shipments rose from \$251,000,000 in the fiscal year 1890 to \$610,000,000 for the same period of 1914. The exports during the 25 years reached a total of \$8,676,000,000. Exports of cotton manufactures increased from \$10,000,000 to \$51,000,000 in the time named with a total export in the period of \$708,000,000.

In the earlier years Europe took practically all the raw cotton exported, although of late Japan has taken considerable quantities. The total exports of American cotton to Japan in 1912 were about 240,000,000 pounds and in 1914 177,000,000 pounds.

A comparison of the exports of raw and manufactured cotton for the years 1890 and 1914 to the various grand divisions shows following results:

	1890.	1914.
Value of exports of		
Raw cotton	\$251,000,000	\$610,500,000
Cotton manufactures	10,000,000	51,500,000
Totals —		
Europe	1,400,000	8,000,000
North America	2,800,000	21,100,000
South America	2,700,000	3,800,000
Asia	1,700,000	9,000,000
Oceania	800,000	8,800,000
Africa	600,000	800,000

The cotton manufactures exported during the year 1914 included the following quantities, with their destination: China, 89,000,000 yards; Philippines, 86,000,000 yards; Central America, 36,000,000 yards; Cuba, 24,000,000 yards, Canada, 21,000,000 yards; British West Indies, 15,000,000 yards, and India, 14,000,000 yards. As a whole Europe took 7,000,000 yards; South America, 41,000,000 yards; Oceania, 95,000,000 yards; Asia, 125,000,000 yards; Africa, 9,000,000 yards, and North America, 138,000,000 yards.

Cotton imports during the last quarter century were valued at \$259,000,000, the largest part coming from Egypt.

While Asia exceeded North America as a market for American cotton goods in the aggregate for the last 25 years, North America, including Canada, British West Indies, Hayti, Cuba, Santo Domingo, and the Central American Republics is now the leading market for American cotton goods.

ACTIVE TIMES WITH NEW ENGLAND MILLS.

Large credit loans have recently been obtained by France and Russia, which are benefiting the manufacturers of New England, particularly those making cotton duck and hosiery as well as woollens.

According to report the French have secured credits for \$10,000,000, to which extent orders were placed which are keeping the New England mills busy. Many of these mills were already working overtime producing goods previously ordered, and the new orders will doubtless ensure their operation on a twenty-four hour schedule for weeks to come.

Just as the establishment of these large French credits was followed by the placing of large orders for the government of that country with the New England mills, so have the new Russian credits been the signal for like activities on the part of the agents of the Czar.

Philadelphia manufacturers have been laying in supplies of yarn from the smaller textile centers, which is an indication of prospects of future business encouraged by the low prices of yarns. That similar activity has not been witnessed in New England is caused by the unusually heavy buying from that quarter with the low prices during the early part of the war.

While the large stocks of goods on hand would have allowed the execution of these foreign orders a large proportion of the former are of a quality unsuited to the needs of the belligerent nations. It is, moreover, a question whether the amount of domestic material sold to foreign nations has been sufficient to affect the later

course of prices. Buying orders for the domestic trade which may result from a cold snap would make demands upon makers' stocks which they would be unable to meet.

Colored cotton goods have in some cases been taken off the market until supplies of colors become more assured.

BRITISH COTTON GROWING ASSOCIATION.

This association has made satisfactory progress during the last three years, the total quantity handled in its various sections being respectively: 1911, 60,800 bales (of 400 pounds); 1912, 71,400 bales; 1913, 78,800 bales. The operations of the association are in West and East Africa, Sudan and the West Indies. In the year 1914 it is anticipated to attain an aggregate production of 100,000 bales.

A project was launched at this year's Paris Cotton Congress for the establishment of a model cotton plantation in the Punjab district of India. The funds will be provided by a company with a capital of \$300,000. The Indian government has granted a free lease of 7,500 acres suitable for cotton, in proximity to the North Western Railway. A system of intensive cultivation will be adopted on the plantation.

REDUCTION OF COTTON ACREAGE.

It is announced that 33 counties in Georgia will make a combined reduction for 1915 equaling 42 per cent. of their acreage planted in cotton. In 15 of these counties the reduction was expected to be 50 per cent. or more than that proportion.

COTTON GINNING RETURNS.

In the government return from October 18 to November 1, ginnings are shown as 2,207,116 bales, bringing the season's aggregate to 9,828,695 bales, or 855,177 over that of same period last year. Sea Island cotton included in the above numbered 43,331 bales, compared with 42,804 bales to November 1 last year.

Ginnings by States to November 1 were as follows:

	Florida.	Georgia.	So. Carolina.
1911.....bales	21,038	33,841	1,684
1912.....	11,067	16,276	1,544
1913.....	16,356	24,570	1,878
1914.....	19,270	23,164	877

In four of the cotton States the figures to November 1 exceeded those of the last eight years.

EGYPTIAN COTTON ACREAGE REDUCED.

An Egyptian government decree reduces the acreage of cotton for the agricultural year 1915 by about 50 per cent., with a view to limiting the production to the requirements of the market, and thus maintaining a reasonable price for the crop. The decree provides that the maximum to be cultivated is to be 1,000,000 "feddahs" or 1,100,000 acres. Planting is entirely prohibited in the Upper Egypt basin. It is also prohibited for any owner or lessee to cultivate more than one-quarter of the area of an estate. Lands benefiting from summer irrigation will be considered as forming separate estates.

SEA ISLAND COTTON IN SANTO DOMINGO.

According to the report of the British Chargé d'Affaires at Santo Domingo, cotton shipments from that source decreased from 350 tons in 1912 to 247 tons in 1913. Though progress is not being made generally in the cotton growing industry of the island, there is a prospect of the plantation of Sea Island cotton established by an American company at that point turning out a success.

CANADIAN OPINION ON THE WAR.

In discussing the economic consequences of the war, the "Revue Economique Canadienne" remarks that the profits which may be made by Canadian factories in consequence of the precarious situation of European industries will only be temporary and will be insufficient to make up for the losses which Canada will inevitably suffer by the war.

NEW TRADE PUBLICATIONS.

A NEW RUBBER MAP.

THE Republic Rubber Co., of Youngstown, Ohio, has had prepared a world map which should be appreciated by the trade, for it designates, by special colorings and other markings, the rubber producing countries of the world and the rubber markets. It also gives the routes between the ports of the countries of production and sale, with the distance between these various points. The distance from Para to New York is thus shown as 2,900 miles, while the route from Colombo to San Francisco is 10,059 miles long and that from Colombo to New York, via the Panama Canal, is 13,361 miles in length—the distance between the Canal and New York being 1,961 miles. From Colombo to London by the Red Sea route and the Mediterranean is shown to be 8,000 miles, and by the southern course, touching at Cape Town, Congo River and the Cape Verde Islands, 12,000 miles. In addition to these features, the map attempts to show only the important divisions of the various countries and the chief cities, the special information it is intended to convey standing out clear and distinct.

PREVENTION OF ELECTRICAL ACCIDENTS.

In a neat booklet the Travellers Insurance Co. of Hartford, has alphabetically grouped a number of points in which foremen and others in positions of responsibility require to be on the watch for danger.

While these include general mechanical operations, some of them specially affect the rubber industry. Under the latter head comes the advice to electrical workers not to handle any electrical apparatus without wearing rubber gloves, which should be kept in good condition. Safety belts should be provided for men working on overhead lines and dark colored glasses for those obliged to look at intensely brilliant arcs. An experienced assistant should be always at hand to render aid in cases of emergency. The floors around switchboards and high tension apparatus should be non-conducting, and should be covered with rubber mats to provide effective insulation. Water should never be permitted to stand upon the floors in the vicinity of any electrical apparatus.

THE NETHERLAND CHAMBER OF COMMERCE IN AMERICA.

The eleventh annual report of the Netherland Chamber of Commerce in America, for the year ending March 31, 1914, has been issued, and contains much interesting matter as to the operations of the chamber on international questions in which the Netherlands is interested, as well as various details regarding the Dutch East Indies.

Forming the connecting link, geographically speaking, between the mainland of Asia and Australia, the Dutch East Indian Archipelago consists of a group of islands lying between the fifth degree northern, and the tenth degree southern latitude, and between 95 deg. and 140 deg. eastern longitude. The total area of these islands is about 587,370 square miles, and their population over 40,000,000, the principal islands being Java, Sumatra, Borneo and Celebes. In part this territory is under the direct rule of the Dutch government, while in other sections it is in the hands of native rulers, tributary to the Dutch Crown, of which they recognize the suzerainty.

Statistics for 1912 show the total investments in rubber in the Dutch East Indian Archipelago to have been \$83,654,390, made up as follows: British, \$57,496,170; Dutch-Belgian, \$14,398,395; French-Belgian, \$10,782,565; German, \$500,890; American, \$402,000; Swedish, \$74,370. The large amount of British capital was attributed to the "rubber boom" of 1910.

Various features of the industries of the Dutch Indies are dealt with.

EDITOR'S BOOK TABLE.

SLAVE STORIES IN RUBBER SEEKING. BY J. W. L. THE Walter Scott Publishing Co., Limited, London and New York. [8vo, 251 pages, cloth covers.]

TO those who consider that time lost which is not spent in some manner associated with the rubber business, this book offers an opportunity to carry their hobby into the realm of fiction; while at the same time it is not likely to lack appreciation from the general reader.

The book is divided into three sections and twenty-one chapters, each in itself a complete tale. The first section contains, under the title "Faltering Remains," twelve complete stories, most of which terminate tragically, including the tale of "The Rubber Fortunes Syndicate," which relates how John K. Bell, "an American optimist," and Joseph O'Hagan organized at Santander, on a basis of pure imagination, a £250,000 syndicate, in £1 shares, which in six weeks were five times oversubscribed in London; the result in the way of returns to the investors being practically viewed in the light of a tragedy. Then there is the story of "The Rubber King," Sir Peter Dinero, a self-made man, whose greed leads him to attempt a corner on rubber—an attempt of course frustrated by the hero of the tale, Captain Paul Marline, R. N., representative of the Rubber Investors' Committee. Captain Marline, as commander of H. M. cruiser, "Python," is also the hero of another story, "The Discovery of Gummer."

The most interesting chapter in the book to those concerned in the practical application of rubber to the needs and comforts of life will doubtless be the one entitled "A Rubberless World." While this is a dream story it brings a realization of how much more than is ordinarily appreciated we are dependent upon rubber. Starting with an office in Leadenhall street, where first a report is received of a rubber shortage and later that all the rubber in the city has disappeared, the dismay caused by the failure of the rubber office stamps to perform their usual office spreads when the elastic sides and rubber heels drop from the wearers' shoes; papers fall apart because rubber bands fail of their mission; erasers melt away; no telegrams or cables can be sent because the insulation has disappeared from the wires and cables; motor cars are put out of commission through the failure of their tires, etc., etc.—all ending in a vast conflagration which destroys the entire city, its suppression being rendered impossible by the absence of hose.

The second section is devoted to slave stories, under such titles as "For Sale—Two Hundred Souls"; "The River of Despair"; "Freedom's Dream," and "Milestones of the Dead," the last being taken from "John Bull," said to be founded strictly on fact and recounting the tale of torture inflicted on Africans in the caravan of one Don José Ricardo. One such victim, who fell sick and was unable to proceed further was pegged to the ground with a gourd of water within a foot of his lips, while his body, exposed to the intense heat of the sun, was covered with salted cloths intended to attract butterflies and bees; another, an old woman, had her wrists cut in little knots so that she would slowly bleed to death, and that she might die in comfort consistent with the civilization carried to that country by the gallant Don and his type, she was placed on an ant hill. Still another, a young girl, was suspended over a slow burning fire, from which she was rescued to tell this tale.

"The Bridge of the Incas," which appears in the third section, under "Patagonian Tales," is probably the most satisfactory story in the book, for in its nature comes to the aid of justice, the imagination of the writer producing a volcano which at just the right moment becomes actively eruptive, assisting the escape of the young lovers and at the same time consigning the villain to the fiery doom he so well deserves.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

THE OBITUARY RECORD.

ALFRED BOOTH.

ALFRID BOOTH, head of the Booth line of steamships plying between Liverpool and the Amazon, and with a special service between New York and the Amazon (the foremost rubber carrying company anywhere in the world) died on November 1 at his home in Liverpool, England. While he spent by far the greater part of his eighty years in England, still he had so many interests in this country and came here so frequently in addition to the period of sixteen years during which he resided here—that he was widely known in American business circles.

He was born in Liverpool, in 1834, and while still a young man established in that city a company for the importation of leather for the manufacture of footwear; but he was not satisfied with this restricted outlook and in 1857, while but 23 years of age, he came to this country to embark on larger enterprises. He lived here until 1873 and in the meantime he established a large leather manufacturing company in Gloversville, New York—known for many years as Booth & Co. and now known as the Surpass Leather Co.—and also established the Booth Steamship Line, with steamers plying between New York and Para and Liverpool and Para. It was this particular enterprise that brought him in close touch with the rubber industry, as almost all of the rubber exports from Para to New York and Liverpool during the last forty years have been carried in the ships of this line. From a small beginning the operations of this company have increased until it has regular sailings four times a month from Para to Liverpool and almost as frequently from Para to New York; and some of its ocean going steamers penetrate the Amazon valley as far as Iquitos, over 2,000 miles from the Atlantic Ocean.

Mr. Booth was not only successful in the various commercial matters in which he was interested but he was well known in social circles in this country. He married, in 1867, the daughter of Benjamin F. Butler, Jr., at that time the leader of the New York bar, who a number of years earlier had been the law partner of Martin Van Buren and Attorney General in the cabinet of President Jackson. Mr. Booth is survived by his wife, six children and a number of grandchildren, all prominent in the social, commercial and philanthropic life of Liverpool and vicinity.

A. R. MACDOUGALL.

A. R. MacDougall, assistant superintendent of the Federal Rubber Manufacturing Co., Milwaukee, died at his residence in that city on November 20, from diphtheria, after a few days' illness. He was born in Nova Scotia, thirty-seven years ago, but went to Boston when he was twenty-three, and entered the employ of the Boston Woven Hose & Rubber Co., with which company he remained until 1912, when he went to Milwaukee to take an assistant superintendency in the Federal factory. He was highly esteemed by his fellow employees, and particularly by the workmen in his department.

ALFRED BOOTH.

MARGARET E. KNIGHT.

Miss Margaret E. Knight, who died at the Framingham Hospital some six weeks ago, was at one time a person of interest in the rubber business. Miss Knight had often been referred to in public prints as the "Woman Edison" because of the number of patents which had been issued in her name alone, or with co-inventors. It was said that she had many bright ideas on mechanical subjects but that most of her inventions were not mechanically or commercially successful until they had been perfected by others who were called in to assist her.

In 1879 she invented a machine for making square bottomed paper bags, which was sold to a corporation for a considerable sum and is in use today. It was several years later when she became interested in rubber shoe making, and in 1890 she secured two patents for machinery for cutting rubber soles from the sheet. It is, of course, known to the trade that such soles were all cut by hand, as the edges had to be on an angle or bevel. Between that date and 1894 she was granted eight or more patents for rubber sole-cutting machines. At this time she secured the interest of Colonel Lockwood of this city and Robert D. Evans, of the American Rubber Co. of Cambridge. Through their pecuniary assistance she was enabled to hire experts, and at last a practical machine was completed. This worked excellently in the shop where it was built, and it was installed in the American Rubber Co.'s plant in East Cambridge, where a number of prominent rubber footwear manufacturers were invited to see it in operation.

Such was Miss Knight's connection with the rubber trade. Her other patents (she is said to have secured over 80) run from a spit on which to roast turkeys, and clasps to hold a blanket over a truckman's lap, to window-frame sashes, boring tools and automobile wheels. Miss Knight was born in Manchester, New Hampshire, about 75 years ago, later residing in Springfield and Ashland, Mass., and for the last 25 years in South Framingham, where she occupied a stately old mansion in which she had her "workshop" and laboratory, where she spent much of her time in research and experiment, but making frequent trips to Boston or New York, where her experimental machines were built. She was a tall, robust woman, white-haired, but very active for her age. She had many law suits, but claimed that every one was decided in her favor. She had a shrewd faculty in securing financial backers to experiment and exploit her inventions. About four months ago she was attacked by a severe illness, and was removed to the Framingham hospital, where she died on October 13.

INFORMATION WANTED ABOUT ANDREW H. SMITH.

The Connecticut Mutual Life Insurance Co., of Hartford, has written to this publication to the effect that in 1887 it issued a policy of insurance on the life of Andrew H. Smith, who gave his address as New York City and his occupation as manufacturer of rubber goods. The company has not heard from Mr. Smith for many years, and thinks that he may have deceased. The insurance is still in force, and in case Mr. Smith is not living, and left heirs, the company is prepared to entertain a claim on the policy. If anyone in the trade knows Mr. Smith or can give any information regarding him or any possible heirs, the insurance company would be glad to get the information.

MR. BRADY'S RUBBER HOLDINGS.

The estate of Anthony N. Brady has been appraised at over \$77,000,000, of which amount over \$67,000,000 represents investments in stocks and bonds. He had the following large holdings in rubber companies:

In the Intercontinental Rubber Co. he held 589.60	
shares preferred, valued at.....	\$58,960
do 40,809.60 shares common, valued at.....	306,072
In the United States Rubber Co. he held 45,020.40	
shares first preferred, valued at.....	4,276,938
do 75,754.20 shares second preferred, valued at..	3,787,710

The Rubber Trade Association of New York.

THE formation of the Rubber Trade Association of New York with the election of officers and appointment of committees was mentioned in the November number of this journal. The Constitution and By-Laws have since been published under the general title:

GENERAL RULES AND REGULATIONS RELATING TO THE CONSTITUTION AND BY-LAWS OF THE RUBBER TRADE ASSOCIATION OF NEW YORK.

These rules and regulations are divided into a preamble and thirteen articles. The more important and interesting of these articles are given in full below together with a brief summary of the other articles.

PREAMBLE

I. The association shall be called "THE RUBBER TRADE ASSOCIATION OF NEW YORK."

II. The objects and purposes of the association are to foster and promote the best interests of the rubber trade as a whole for the mutual benefit of all concerned, importers, brokers, dealers and consumers; to reform any abuses relative thereto, to procure uniformity and certainty in the customs and usages of the rubber trade, to settle differences and disputes in the trade by arbitration, to promote a more enlarged and friendly intercourse between those engaged in the trade, and for those purposes to make and enact rules for the proper supervision and efficient conduct of the trade, including the regulation of mutual transactions between members of the association.

Article I states that any co-partnership, corporation or individual engaged in the business of crude rubber in the United States shall be eligible to membership. It refers to the obligation of the members to conform to the rules of the association. Each firm, co-partnership or corporation is only entitled to one vote in the association.

ARTICLE II.—MANAGEMENT.

The first section of this article is as follows:

SEC. I. The management and conduct of the affairs of the association shall be entrusted to a board of eleven (11) directors elected from members of the association in good standing, seven of whom shall constitute a quorum. There shall be elected by the board of directors each year from among those serving on the board a President, Vice-President, Secretary and Treasurer of the association.

The second and third sections refer to the terms of the various officers and the appointment of the various committees.

Article III describes the method of applying for membership.

ARTICLE IV.—MEMBERSHIP DUES AND FEES.

Sections one and two are as follows:

SEC. I. Initiation fee for membership to the association shall be \$25.00.

SEC. II. The annual dues shall be \$25.00 payable in advance on the first day of November in each and every year.

Sections three, four and five refer to the payment of dues.

ARTICLE V.—OFFICERS AND THEIR DUTIES.

SEC. I. The officers shall consist of a President, Vice-President and Treasurer and Secretary, who shall continue to hold their offices until their successors are elected and assume office.

The other sections describe the duties of the different officers.

Article VI.—Association Meetings—describes the place and time of holding meetings, the order of business and calling of special meetings.

ARTICLE VII.—VACANCIES IN THE BOARD OF DIRECTORS.

As indicated by the title, this article describes the procedure for filling vacancies in the board of directors and also for the removal of any director whose conduct is prejudicial to the interests of the association.

ARTICLE VIII.—ARBITRATION.

This article having to do with a matter of interest to the whole rubber trade is reproduced in full.

SEC. I. The Arbitration Committee shall, unless otherwise provided in the contract, have the power when called upon by a member or a non-member to arrange for a settlement by arbitration of matters in dispute between such member and any other member, or between a member and a non-member in connection with any business transaction entered into between them, and the following shall apply to all such references:

SUBDIVISION (a). The disputants or one of them, shall apply to the Committee for an appointment of arbitrators and the Committee shall thereupon appoint two arbitrators and an umpire, who need not necessarily be members of the association but at least one of whom shall not be a member of the Committee, for the purpose of settling the dispute. No arbitrator or umpire shall act in any case where he is interested in the subject-matter of the dispute, without the consent in writing of all parties to the dispute. A fee of \$25.00 in respect to such appointment shall be paid to the association by the party or parties to the dispute who shall apply for such appointment. Such fee, including arbitration and umpire fees, shall be ultimately borne and paid by the losing party, unless otherwise awarded.

SUBDIVISION (b). The fees for arbitrators or the umpire shall be \$10.00 each, but such arbitrators or umpire shall be awarded extra fees, in the discretion of the Arbitration Committee, if in the judgment of the Committee said arbitrators or umpire shall have performed unusual or extraordinary services during the arbitration on which they have served.

SUBDIVISION (c). In the event of the arbitrators being unable to agree on an award, they shall refer the dispute to the umpire.

SUBDIVISION (d). The umpire and arbitrator shall be at liberty to take such evidence and offer such documents in possession of the parties in dispute as they may deem necessary, and shall also have the right to require any of the parties to give such testimony in the matter in dispute as may be required, and for that purpose to require the attendance of the parties at such times and places as may be fixed for the hearings.

SUBDIVISION (e). Necessary costs and disbursements of the successful party, as well as the stenographic fees shall be paid by the losing party, unless otherwise awarded. An award of such arbitrators or umpires (as the case may be) shall be absolutely final and binding upon the parties for all purposes, unless the parties dissatisfied, forthwith, within three working days thereafter, lodge with the Committee a written notice of appeal, together with a fee of \$50, and serve a like notice upon the other party or parties to the dispute, in which case the Committee shall review the award and shall determine the rights of the parties.

SUBDIVISION (f). The Committee shall have the like rights and powers as are hereinbefore conferred on the arbitrators and the umpire for the purpose of enabling them to determine the rights of the parties, and their decision shall be absolutely final and binding upon all parties to the dispute. The said fee of \$50 shall be ultimately borne and paid by the losing party, unless otherwise ordered by the Committee.

If an arbitration covers a case where the seller has offered an allowance which the buyer has rejected, claiming that the allowance should be greater, and the arbitrators decide that the allowance should be equal to or lower than offered by the seller, the buyer shall be considered as the losing party and pay the fees. Such offers of settlement must be stated in the application to the Committee prior to arbitration.

SUBDIVISION (g). Members of the association, by signing the within rules and regulations, agree to submit their differences to arbitration as herein set forth, and to abide by the award. Any member of the association who refuses or neglects to submit any matter in dispute for arbitration or to abide by the award duly made, shall be suspended from privileges of the association in the discretion of the board of directors, and it shall be mutually agreed between all the members that such conduct on the part of any one or more members shall justify the others in dealing with such member only on a cash basis in the delivery of goods, supplies and materials used in the crude rubber trade.

SUBDIVISION (h). When a matter in dispute has been referred to the arbitrators or umpires (as the case may be) the said arbitrators or umpire shall require the party who considers himself aggrieved to file with it a written complaint, specifying the nature and grounds of his grievance, within the time fixed by them. Said arbitrators or umpire, after receipt thereof shall serve notice upon the member or person against whom the com-

plaint is lodged to make his answer to the same within a time specified, and the said party shall within the time cause an answer to be filed with the arbitrators setting forth concisely his reply to the matters set forth in the complaint. If there is no dispute as to the facts, the arbitrators may proceed to determine the matter under consideration without calling any witnesses or requiring any formal hearings. If from the complaint and answer filed by the disputants it appears that the facts in question are disputed, the arbitrators or umpire (as the case may be) shall then proceed forthwith to hear and determine the matter by calling the witnesses and requiring any further testimony that it may deem advisable in the premises.

ARTICLES IX TO XIII.

Article IX describes the method of expelling a member from the association should that ever become necessary. Article X covers the proper procedure in tendering all resignations. Article XI states the limitation of the authority of officers to contract debts for the association. Article XII refers to the interpretation of by-laws and article XIII to their amendment.

RUBBER SOLES AND HEELS.

The demand for rubber sole shoes has led a number of rubber factories to enter the field, among the largest of these being the New York Belting & Packing Co. This company's line embraces hundreds of different patterns of soles and heels, in qualities to meet all requirements, from the high grade "Indestructible" combination sole to the lower-priced all rubber article.

This company's large press room facilities enable it to meet all demands as to quick deliveries even in the height of the season.

Its experimental department is constantly working with a view to the improvement of the line, the feeling being entertained that for some classes of shoes, owing to the high cost and scarcity of leather, rubber soles will be used permanently.

The accompanying illustration is selected from a large bound volume of drawings showing the range of sizes of some of the styles most commonly called for. [New York Belting & Packing Co., 91-3 Chambers street, New York.]

FREIGHT RATES TO PACIFIC COAST CHANGED.

To meet water competition, the transcontinental railroads formerly made rates from New York to Pacific Coast terminals that were less than rates to intermediate points.

By an amended clause of the Act to Regulate Commerce, carriers are prohibited from charging more for a short haul than for a long haul. The railroads have therefore readjusted charges on less than carload shipments from New York to intermountain points, and have cancelled the former commodity rate.

The following are the articles upon which "less than carload" commodity rates from New York and eastern points to Pacific Coast terminals were cancelled November 15, 1914. On that date the class rates subject to Western classification went into effect on these articles, advancing the former rates:

Rubber boots and shoes, including tennis shoes (canvas tops) and felt boots; rubber coils, rubber discs for bottle stoppers; rubber, crude; reclaimed rubber or rubber shoddy; rubber tissue, rubber sheeting and rubber compound repair stock in sheet form; rubber rings for fruit jars; rubber spittoons; rubber springs, including rubber springs (or bumpers) for vehicles; rubber tiling; rubber tubing; tires (vehicle), solid rubber, attached to iron channels or rims; wire and wire goods, viz., wire, insulated or covered; wire rope or cable; wire telephone or electric light cables; copper wire, copper clad wire, copper rope or copper cable.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A Portuguese agent desires to secure automobile tires and equipment, etc. Correspondence should be in Portuguese or French. Report No. 14,216.

An American missionary hospital in the Far East wishes to be placed in communication with American firms manufacturing rubber goods and drug sundries. Report No. 14,249.

A large rubber manufacturing concern in Great Britain wishes to contract for regular consignments of 100 to 500 gallons of tetrachloride of carbon from American manufacturers. Report No. 14,304.

An American consular officer in the United Kingdom has been furnished with a list of electrical articles now finding ready sale in that country. This list includes electrical cables insulated with vulcanized rubber. Report No. 14,416.

A Portuguese firm wishes to purchase automobile tires. Correspondence should be in Portuguese or French. Report No. 14,419.

A company in the East Indies is prepared to export plantation rubber, either pale crêpe, smoked sheet or any other kind, according to the desire of the purchaser. Report No. 14,429.

A firm in Europe is in the market for pharmaceutical accessories, such as rubber tubes, etc., Report No. 14,430.

The Stavanger Elektricitetsverk, of Stavanger, Norway, is in the market for vulcanized rubber insulated wire according to the standard of the Verband deutscher Elektrotechniker of 1910, especially for 1½ square millimeters (0.002325 square inch) size. Samples should be forwarded and prices quoted by the 10,000 meters (32,808.3 feet).

A firm in Italy desires to purchase Brazilian, Bolivian and Peruvian crude rubber. This firm is in a position to handle considerable quantities and is willing to purchase on any terms, c. i. f. destination. References given. Correspondence should be in French or Italian. Report No. 14,381.

A company abroad has requested the American consul in that place to put it in touch with American manufacturers and exporters of ponchos, sleeping blankets and ground sheets combined. The inquirer understands that the type of article wanted is used by the American troops in the field. The firm has several branches throughout the country. Correspondence should be in English. Report No. 14,554.

GARDEN HOSE IN CONTINUOUS LENGTHS.

Corrugated reel garden hose in lengths of 500 feet or less, in sizes of ½, ⅝ and ¾-inch diameter, black or red, has been added to the regular line of smooth hose manufactured by the New York Belting & Packing Co. It is sold under the following trade marks: "Magic," "Delta" and "Jubilee Corrugated."

INTERNATIONAL EXPOSITION OF INVENTIONS.

Under the above title an exhibition is to be held from December 12 to 19, inclusive, at the New Grand Central Palace, New York, in the interest of inventors, who will have an opportunity of displaying inventions on which they have secured patents. American Institute gold, silver and bronze medals and diplomas will be awarded to those whose products combine, in the opinion of a qualified jury, the greatest measure of novelty and utility to the world with mechanical and commercial practicability. It is proposed, also, to organize, from representatives of the several associations of inventors and patentees in America, a Congress of Inventors, which will put on record the needs of their class and the injustice with which they are obliged to contend under present legislative conditions. Lectures on subjects pertinent to the interests of inventors and patentees generally will also be given in connection with the show and congress.

The British Embargo on Crude Rubber.

A Joint Committee of Manufacturers and Importers Appeals to Washington.

WHEN late in October cables were received in New York stating that England had placed an embargo on the shipments of crude rubber from any British colonial ports to any point except London, and when, about the same time, other cables were received intimating that the government was about to place an embargo on all crude rubber shipments from the home ports of England as well, the rubber trade of the United States was quick to realize the seriousness of the situation. A joint meeting was held on November 2 of the executive committee of the Rubber Club of America and a special committee appointed by the Rubber Trade Association of New York. As a result of this meeting a committee of manufacturers and importers was appointed, consisting of the following members: H. Stuart Hotchkiss, of the United States Rubber Co.; Arthur Marks, of The B. F. Goodrich Co.; George B. Hodgman, of the Hodgman Rubber Co., president of the Rubber Club of America, and Wm. E. Bruyn, president of the Rubber Trade Association of New York, who were to see what steps might be taken to relieve the situation. The committee at once got into communication with the State Department and brought to the attention of the Acting Secretary the great hardship that would fall upon the rubber industry of this country if this embargo were long to continue. The two letters sent out by the secretary of the Rubber Club to leading members of the trade, which are given below, indicate what has been done by the committee and how the matter now stands:

November 17, 1914.

Announcement was made on November 16 that the British Government had placed an embargo on all shipments of crude rubber from England in addition to that formerly placed on direct shipments from her colonies. This embargo seems to have been due to the re-exportation of crude rubber from the United States to the enemies of Great Britain.

The matter was taken up at once with the proper authorities at Washington by the special joint committee of rubber importers and manufacturers with a view to making some arrangement whereby these embargoes may be raised through a guarantee that the rubber will not be re-exported.

H. S. VORHIES, Secretary.

November 24, 1914.

The joint committee of rubber manufacturers and importers has been in constant touch with Washington and London since its report on November 17. It believes that it is working through every public and private channel available. So far nothing tangible has resulted and the committee regrets that it can only report that it will spare neither time nor expense in its efforts to relieve the situation.

As the matter now stands, rubber cannot be imported into the United States from any British port. England has the power to withhold her rubber from us. Until she is sure that her wants are fully supplied and is convinced that rubber coming to the United States will not be re-exported to her enemies, the embargo probably will not be raised. Your committee is working along these lines.

A joint committee has been appointed by the Rubber Growers' Association and the Rubber Trade Association of London, which is to confer at once with the proper British cabinet officer to ascertain if some arrangement cannot be made to lift the embargo. This committee is co-operating in every way with the joint committee of manufacturers and importers of the United States.

H. S. VORHIES, Secretary.

It need only be added that the situation is the same now as mentioned in the secretary's letter of the 24th. The British Government as yet has given no intimation as to its action.

OTHER APPEALS TO THE STATE DEPARTMENT.

In addition to the activities of the joint committee mentioned above, appeals have been made to the State Department from private quarters. Among these was one sent late in October by

W. L. Wadleigh, who recently established the firm of Wadleigh & Co., Limited, in Singapore, for the purpose of buying and shipping crude rubber direct to manufacturers in the United States. In reply to his letter he received the following communication from the Acting Secretary of State:

Department of State, Washington.

November 6, 1914.

Mr. W. L. Wadleigh, Sir: Referring to your letter of October 24, 1914, and to this department's reply of November 3, 1914, regarding the embargo against the shipment of crude rubber from British Colonial ports to the United States, you are informed that the department recently telegraphed the American ambassador at London, England, that American interests desire the lifting of the embargo on rubber, and requested the ambassador to ascertain upon what grounds this embargo had been instituted, and whether shipments might be allowed to the United States from Great Britain, her colonies and dependencies. A similar telegram was sent to the American Consul General at Singapore, Straits Settlements, with the additional statement that American importers would doubtless, if required, give a guarantee against the re-exportation of the raw materials received.

A telegram just received from Singapore states that the American Consul is awaiting information as to the grounds for the embargo and whether exportation to the United States would be permitted if a guarantee against its re-exportation was given. It is added that the exportation of gutta and jelutong is now permitted.

You will be advised when further information is received.

I am, sir, your obedient servant.

(Signed) ROBERT LANSING, Acting Secretary of State.

WHAT NEW YORK IMPORTERS THINK OF THE SITUATION.

New York rubber importers, when recently interviewed in regard to the British embargo, appeared to entertain somewhat different opinions as to its operation and effect. A member of a large importing house spoke as follows:

"It has been privately understood from the British consul that England has no desire to interfere with legitimate American rubber export trade. It is believed rubber shipped from the United States is reaching Germany through Norway, Sweden, Denmark and Italy. As soon as satisfactory guarantees can be made, and certified papers exchanged between the British consul and the consul of the countries to which the rubber is being shipped showing that it is a bona fide shipment to a non-combatant, the restriction will be removed. There is no question but London has plenty of rubber as evidenced by the recent reduction of price from 27d. to 25d. The embargo will be lifted in a few days, as soon as satisfactory arrangements can be made controlling United States shipments."

Another importer took a somewhat different view. Here is what he had to say on the situation:

"There is belief in some quarters that London is short of rubber and the embargo ruling is the result of England's desire to be assured that her rubber supply will not be interfered with. It does not appear from the strict watch the United States Government is keeping on rubber shipments that England can have any serious ground in believing that great quantities of rubber are reaching her enemies by way of the United States."

Another said that there was but little rubber in sight and no large cargoes afloat, and if he had any quantity of rubber on hand he would hold it for the advance which he believed inevitable.

H. M. Leake, Economic Botanist, United Provinces, India, has been appointed principal of the Agricultural College Cawnpore. He is a son of W. Martin Leake, secretary of the Ceylon Association, London.

Sweden's output of rubber shoes in 1912 represented 3,869,066 pairs, value \$2,128,997. Imports of rubber at Goteborg amounted in 1912 to 558,728 pounds, and in 1913 to 622,405 pounds.

MR. BUCKLETON'S HOME FOR BELGIANS.

MR. ERNEST E. BUCKLETON, president and general manager of the Northwestern Rubber Co., Liverpool, England, who has been spending a few weeks in the United States, is doing notable work for the Belgian refugees. It will perhaps be remembered that he knows personally the whole of the rubber trade in England and on the Continent. The suffering of the Belgians, therefore, not only those connected with the rubber industry, but the whole nation, appeal to him very strongly. As a practical measure of relief he has turned a large house he owns in Liverpool into a refuge for them. Here 31 are already accommodated and he ex-

ERNEST E. BUCKLETON.

pects shortly to be able to take care of 75. These people are of the better class of Belgians but are wholly destitute. They are fed very simply but well, and wherever possible shown how to help themselves. To further this work Mr. Buckleton made an earnest appeal to citizens of Akron, where he is well known, and generous contributions were at once forthcoming. In Trenton he also received a warm welcome, a club there, to which he once belonged, subscribing \$500 for a start. The funds that are thus collected are sent to the Belgian Consul at Liverpool. The manner in which these funds are expended is submitted in detail to the subscribers from whom they come.

With 200,000 Belgians in England at the present time, and nearly 700,000 in Holland, in addition to the five or six millions in Belgium, all of whom are destitute, the object is one that must appeal to everyone. Mr. Buckleton is by no means insistent upon Belgian relief funds being sent directly for his own work; indeed he urges that as soon as \$500 is collected it be cabled to the American Ambassador in London for the Belgian Relief Fund, as the wants are pressing and immediate. His argument in favor of this line of charity instead of the Red Cross is that the soldiers are clothed and fed by their own governments. The Red Cross is also supported by the governments, while the ill-clad, starving Belgians have no such aid.

When it was brought to Mr. Buckleton's attention that the

Rubber Club of America was raising a fund for the Red Cross (or for any other relief organization) he was most anxious that his many friends in the rubber trade should remember the Belgians. Donations sent to the Rubber Club, marked "Belgian Relief Fund," would go to that fund in general. Those marked "Belgian Consul, Liverpool, Account No. 8," would be applied to Mr. Buckleton's relief work.

Incidentally, it is interesting to note that this energetic, warm-hearted British-American is supplying yarn for hosts of busy knitters and lending a helping hand to distressed individuals of a variety of nationalities.

THE RUBBER CLUB'S RELIEF FUND.

UNDER date of November 11 the secretary of the Rubber Club of America sent the following appeal to the active and associate members of the club:

"The members of the club in the recent vote gave an overwhelming majority in favor of not holding our annual banquet this season, and instead making a contribution to the American Red Cross, or any of the other humane agencies, for the relief of the suffering caused by the war in Europe, as may be preferred by the donors.

"It is hoped that each active and associate member will contribute at least \$8—the price of the banquet ticket of last January—and as much more as he feels inclined to add. This is a voluntary contribution and not an assessment."

A somewhat similar letter, but going rather more into detail as to the expectation of the club in reference to this fund, was sent to the firm members.

CONTRIBUTIONS TO THE RUBBER CLUB RELIEF FUND.

In response to the letters sent out by the club's secretary, contributions to the amount of \$1,982 had been received up to November 25, including the following:

FOR THE AMERICAN RED CROSS.	
Arnold & Zeiss, 277 Broadway, New York.....	\$250
Roland H. Ballou, Treasurer Manhasset Manufacturing Co., Providence, R. I.....	100
Hood Rubber Co., Watertown, Mass.....	100
Fisk Rubber Co., Chicopee Falls, Mass.....	50
The Goodyear's India Rubber Glove Manufacturing Co., Naugatuck, Conn.	50
U. S. Rubber Reclaiming Co., Inc., 30 East Forty-second street, New York	50
L. Littlejohn & Co., 129 Front street, New York.....	50
Indiana Rubber & Insulated Wire Co., Jonesboro, Ind....	50
Mechanical Fabric Co., Providence, R. I.....	25
F. H. Appleton & Son, Inc., Boston, Mass.....	25
R. J. Caldwell & Co., 15 Park Row, New York.....	25
Federal Rubber Manufacturing Co., Milwaukee, Wis.....	25
Reading Rubber Manufacturing Co., Reading, Mass.....	25
Obalski & Sweeney, 24 Stone street, New York.....	25
Ed. Maurer Co., Inc., 80 Maiden Lane, New York.....	25
St. Mungo Manufacturing Co. of America, Newark, N. J..	25
The B. F. Goodrich Co., Akron, Ohio	25
Lee Tire & Rubber Co., Conshohocken, Pa.....	25
L. J. Mutt, Boston, Mass.....	25
Boston Belting Co., Boston, Mass.....	25
Republic Rubber Co., Youngstown, Ohio.....	25
Gutta Percha & Rubber Manufacturing Co., 126 Duane street, New York.....	25
	\$1,050

FOR THE BELGIAN RELIEF FUND.	
Hodgman Rubber Co., 806 Broadway, New York.....	\$100
Parker, Stearns & Co., Brooklyn, N. Y.....	100
INDIA RUBBER WORLD, 25 West Forty-fifth street, New York.	25
Acushnet Process Co., New Bedford, Mass.....	25
	\$250
Total	\$1,300

Besides the sums above noted, \$682 has been contributed by members of the club in lieu of tickets for the sixteenth annual banquet, which has been abandoned this season, which brings up the total to \$1,982.

Dedication of the Forsyth Dental Infirmary.

THE dedicatory services at the Forsyth Dental Infirmary in Boston on November 24, marked the realization of the dream of the late James Bennett Forsyth, as brought to consummation by his brothers, the late John Hamilton Forsyth, and the last surviving brother, Thomas Alexander Forsyth, all well known in the rubber trade as members and officers in the Boston Belting Co. This infirmary constitutes a lasting monument to the memory of the deceased brothers, and a philanthropy unique in history.

As has been previously told in this journal, the institution has for its object the correction and cure of dental and oral defects in the school children of Boston. It will care not only for tooth troubles, but also related oral conditions, including defective palates, adenoids, etc. All work, of whatever nature, will be performed at the nominal price of five cents a treatment, thus raising the institution out of the category of a distinctive charity.

The services last Tuesday were in the great infirmary room on the second floor, a room nearly 60 feet wide, 170 feet long and 27 feet high. Here was assembled a company which taxed the seating capacity. Many State and city officials, professional men, philanthropists and members of the medical and dental professions were present. The opening prayer was by Mgr. Splaine, the benediction by Bishop Lawrence. Between these were addresses by David I. Walsh, Governor of Massachusetts; James M. Curley, Mayor of Boston, and President Emeritus Charles W. Eliot of Harvard University, after which Mr. Forsyth, in his quiet, modest way spoke, as follows:

"Mr. chairman, ladies and gentlemen: It seems fitting that I should say a few words to you in regard to the origin and perfection of this new undertaking.

"The idea of providing an institution for the care of the teeth of the children of Boston and its vicinity was first conceived by my brother, James Bennett Forsyth, who died in the year 1909. In carrying out his wishes, my brother and myself desired to erect the infirmary in memory of our brothers, James Bennett and George Henry Forsyth. The building is therefore essentially a memorial foundation. While the consideration of its direct uses was constantly before our minds in its planning and construction, the idea that it was also a memorial has never been lost sight of. The building on this account embodies many artistic features usually lacking in buildings intended solely for hospital purposes.

"In the construction of this institution we have entered a new field. No other building of this character is in existence. The problems we have faced have been encountered for the first time, and for their final solution I have to thank our Building Committee of the trustees, who have given generously of their time, their thought and of their expert knowledge. To their devotion the building owes its evolution and the extraordinary perfection of its professional detail. To the mayor and city council of Boston thanks are also due for their judicious foresight in

the purchase of the land between the infirmary and the art museum. Such promptitude as they have shown in this connection cannot fail to act as a spur to other gifts to the city.

"It has been my wish that the infirmary should be as a home to the children, beautiful and cheerful; a protector of their health, a refuge in their pain. By making them healthier and happier I hope it may make them

THE FORSYTH DENTAL INFIRMARY, BOSTON.

grow to be better citizens of our beloved Boston. If this is accomplished, as I believe it must be, with the cooperation of the dental profession, I shall feel that the gift has been well bestowed."

The key of the building was then presented to Mr. Forsyth by the architect, Edward T. P. Graham—symbolic of the completion of the building and its transfer from the builder to the donor—and Mr. Forsyth in turn handed it to Dr. John F. Dowsley, D.D.S., President of the State Board of Registration in Dentistry, as the representative of the Board of Trustees of the Infirmary. Dr. Dowsley accepted the key with a brief, appropriate reply, after which addresses were given by Milton J. Roseñau, M.D., Professor of Hygiene, Harvard University; Donald M. Gallie, D.D.S., of Chicago, President of the National Dental Association; Edward McSweeney, Trustee of Boston Consumptive Hospital, and William J. Gallivan, A.B. M.D., Commissioner of Health, Boston, and Chief of Bureau of Child Hygiene.

Interspersed in the program were several chorus selections given by children from the school in Roxbury (a portion of Boston) where the four Forsyth brothers received their early education.

After the formal exercises, the building was thrown open for inspection, and during the remainder of the week thousands of persons visited the institution, praising the beautiful building and the philanthropic spirit which prompted its creation.

The building is wonderful, well worthy of its setting near the Art Museum, in the Back Bay Fens. The beautiful colonnaded

front of white marble with broad, high windows has an imposing entrance through a doorway flanked by huge bronze doors, one symbolizing "The Mother, the Giver of Life and Love," and the other "The Commonwealth, the Giver of Health and Learning." In the vestibule are bronze tablets, one bearing the memorial inscription of the donors, the other, the names of the trustees. The hall and stairway are of Siena marble, the ceiling of Onastavino tile. There are bronze busts of James Bennett Forsyth and George Henry Forsyth.

Passing by the secretary's office, the information department and the reception room, we come to the "Founders' Room." This is so beautifully decorated and furnished as to remind one of a baronial hall. A great fireplace of Carrara marble bears the Forsyth coat-of-arms in tiling. On the walls are paintings of personal and historic interest in the Forsyth family, and here are bronze busts of John Hamilton Forsyth and Thomas Alexander Forsyth, the donors. Mr. Forsyth's extensive private library occupies one side of this room. A lecture room occupies the left wing, capable of seating 250 people, in which it is planned to give popular lectures on dental and hygienic subjects. In the other wing are hospital accommodations for surgical patients, and rooms where teeth are extracted. Between these are the usual ante-rooms to the surgical department, and the clinical amphitheatre, a wonderful room, entirely of cement, so built that it can be completely flooded with hot water or steam for cleansing and sterilizing.

The entire building is of fireproof construction; there isn't a bit of wood in the structure itself, and but little in the furnishings, and that little is chemically treated to make it absolutely non-combustible.

On this floor is also one of the finest laboratory and research rooms, fitted with every contrivance to facilitate such work.

One flight up the marble stairway is the great room mentioned before, where 68 chairs for dental work are already placed, lighted through large plate glass windows fifteen feet high, while space is available for as many additional chairs if necessity demands. Some idea of the extent of this room may be realized by the statement that nineteen tons of linoleum were required to cover the floor.

The whole establishment is for children, and the lower floor has reception rooms, waiting rooms, cloak rooms and all conveniences specially adapted to the wants of children. The big waiting room, lined, ceiled and floored with tile, has a big aquarium in the center, a library of children's books at one corner and many little chairs and tables which can be moved around at will. On the walls in Delft tile are designs illustrating children's legends, some of which have already been published in this journal. They illustrate "The Dorchester Giant," a poem by Oliver Wendell Holmes; "Rip Van Winkle"; "The Pied Piper," and "The Golden Fleece." On this floor are the assembling rooms for the dentists, both the permanent staff and the visiting professionals. There is a sterilizing room where each of the 1,000 sets of dental instruments is sterilized after use.

The cost of the structure and its furnishings, together with the endowment to continue its mission in perpetuity, is between three and four million dollars; and all this benevolence is due to the broad, philanthropic spirit of one family, connected with the manufacture of rubber, in one of the oldest establishments of this industry in the world.

A TIRE-MAKING MACHINE COMPANY INCORPORATES.

The Delmon Tire & Machine Co. has been formed at Indianapolis, to manufacture a tire making machine and probably later to manufacture tires. The machine is the invention of Fred S. Delmon, who has been for a number of years engaged in the tire trade, and the plans of the company have been authorized capital of \$1,000,000 provide for the sale of the machine to tire manufacturers as well as for the manufacture. Horace C. Stillwell, of Anderson, Indiana, is president of the company, Fred S. Delmon, general manager, and John H. Holden, senior, treasurer.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

BUSINESS isn't exactly in the doldrums, but—if the program is permissible—it isn't exactly busy-ness. Like the general run of trades, we are feeling the results of the almost universal stringency. Then again, many branches of the rubber business are affected by weather conditions, and it doesn't require a report of any meteorological bureau to prove that New England has been basking in beautiful sunshine ever since last August, until a week ago; and makers of rain-coats and rubber footwear have been so mournful that even the heavy storms of the last few days haven't coaxed a smile on their features. However, automobile supply dealers claim that the fine fall weather has facilitated the wearing-out of tires, and that this has helped their trade. Makers of mechanicals are not over busy, and the druggist sundry people report fair trade. But every rubber man hereabouts is looking for good business from now on, with a reasonably active boom anticipated early in 1915.

Large amounts of money made in the rubber business are being used for the amelioration of mankind, and for the benefit of the public. The Forsyth Dental Infirmary, opened last month—a report of which will be found elsewhere in this number—is one of the institutions which bear out this statement. Almost across the street is the great addition to the Museum of Fine Arts, to be opened in January, which is a memorial to the late Robert Dawson Evans, and donated by his widow. Perhaps of far greater philanthropic importance is the Robert Dawson Evans Memorial Department of Clinical Research, which, beside what its name implies, gives each year a series of public health talks. More than 5,000 persons have attended these talks at the beautiful building in the hospital district, and this winter and spring the course will consist of almost weekly lectures on health subjects by leading specialists in the topics selected. The institution is doing great practical work in thus educating the public in the cause, prevention and cure of diseases and the preservation of health. Surely this is a splendid way to give back to the people some of the profits made in the rubber business.

* * *

The Franklin Rubber Co., which is now at 105 Summer street, will soon remove to 134 Federal street, in the new Federal Building, where it will occupy a deep and spacious store on the ground floor. At present the fixtures are being installed, and it is expected that the company will be in its new quarters early in December.

* * *

The Needham Tire Co. is the title of a concern which has recently been incorporated under the Massachusetts law, with an authorized capital stock of \$350,000. It is intended to manufacture automobile tires and inner tubes at a factory it has secured in Needham. It is stated that the company has assurances of a definite market for a large output. The president is Mr. John S. Patterson, formerly with the Revere Rubber Co., and more recently president of the Patterson Rubber Co. of Lowell.

* * *

Frederick T. Ryder, well known in the rubber footwear trade, is now with the Revere Rubber Co. of this city and Chelsea, where he is giving his attention to the rubber sole and heel department. Mr. Ryder's interest in the rubber business dates back to the time when he was secretary for Deacon Converse, of the Boston Rubber Shoe Co. Later, with the United States Rubber Co., he became acquainted with the shoe wholesalers and rubber footwear distributors throughout the country. A few years ago he became general sales agent for the Apsley Rubber Co., of Hudson, this state. The Revere company is now making the "Spring Step" rubber heel, and also a line of rubber soles for leather shoes.

and a line of combined leather and rubber soles. Mr. Ryder will probably confine his activities, for the present, to forwarding the sale of these specialties.

* * *

Rubber soles are being used to a greater extent than ever before by New England shoe manufacturers. It is estimated that one million pairs of rubber-soled shoes will be manufactured in Lynn alone this season. Brockton, Haverhill, Auburn and other leading shoe centres are using proportionally large amounts of rubber soles, and manufacturers of these goods are rushing. There are also many soles used which have rubber as a component part, fibre, leather, etc., being used in greater or less proportions. Among the recent additions to this class of manufactures is the "Comporub Gum Fibre Sole," made by the Clark Rubber Manufacturing Co., of Franklin, Massachusetts.

* * *

Friends of N. Lincoln Greene of the American Rubber Co. of Cambridge, are congratulating him on the advent of a daughter, born Saturday the 14th of November.

* * *

N. P. James, of the Boston office of the Firestone Tire and Rubber Co., is to wed Miss Freda Phillips, of Dorchester. The engagement was formally announced last month.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE business of the Akron rubber companies seems to be in a healthy condition, and to have been less seriously affected by the war than was at first anticipated. Several of the larger concerns have lately declared dividends at the usual rate, and others report that the past year has been one of unusual success.

The Miller Rubber Co., for instance, whose annual meeting of stockholders was held November 12, reports in a statement of business for the fiscal year just ended: "It has been our banner year. Sales were over two and a half million dollars, and the net profits, after allowing for depreciation on buildings, machinery and tools, and crude and finished material, together with paying 7 per cent. dividend on the preferred stock, and 10 per cent. on the common stock, were increased to \$528,000. The net earnings were about double those of the previous year, or 40 per cent. on the average stock liability for the year. We are adding 1,000 horse power to our power plant, and 75,000 additional feet of floor space, which will give us a floor area of six and one-half acres."

The following officers were re-elected: President, Jacob Pfeiffer; vice-president, C. T. Grant; treasurer, F. B. Theiss; secretary and assistant treasurer, William F. Pfeiffer. These officers, with J. M. Doran, comprise the board of directors.

* * *

The manager of the truck tire sales department of The B. F. Goodrich Co., S. V. Norton, made an address at the Motor Truck Convention held in Detroit recently, which was received with much interest. The subject of this talk was "The Causes and Effects of Overloading and Overspeeding in the Truck Tire Field," being a discussion of tire abuses, their cause and their effect on the wear and life of the tire. The Goodrich company has prepared a list of folders dealing at length with the common causes of tire abuse and with the remedies. These are intended for free distribution either from the Akron office or branches.

* * *

A reorganization of the Star Rubber Co., of this city, has been effected, the entire assets of the business being purchased at receivers' sale and all obligations assumed by the new concern. The officers of the company as reorganized are: President, George W. Carmichael; vice-president, J. W. Miller; treasurer, W. E. Wright; secretary and general manager, E. M. Caldwell.

The superintendent and sales manager, M. B. Clark and G. E. Hall, were associated with the old organization, while Mr. Caldwell, the manager, was for several years sales manager of the drug sundries department of the Miller Rubber Co. The company has arranged for a number of new distributing agencies in the United States and abroad, and reports that, while general business is somewhat dull, orders in hand are sufficient to keep the factory in full operation, and that prospects are exceptionally bright.

* * *

A considerable amount has been raised for the relief of the Belgians. George D. Bates, vice-president of the First-Second National Bank, is chairman of a committee of eight Akron business men and manufacturers engaged in raising funds for this purpose. Three members of this committee are F. A. Seiberling, president of The Goodyear Tire & Rubber Co.; C. B. Raymond, of The B. F. Goodrich Co., and A. Adamson, of the Adamson Machine Co. This committee came into being through the activities of Mr. Ernest E. Buckleton, president of the Northwestern Rubber Co., of Liverpool, who has long been a personal friend of Mr. Bates and who recently visited Akron in the interest of this fund.

* * *

The Gregory Rubber Co., one of Akron's smaller but thriving rubber concerns, which makes a specialty of toy balloons for advertising purposes, will move about December 1 to 144 North Union street. The demands of increasing business have necessitated this move, and in its new home the company will have three times its former floor space, with double its old capacity. A line of rubber novelties for advertising, souvenir and premium purposes is soon to be added to the factory output.

* * *

The Goodyear Tire & Rubber Co. has just closed a very successful season, its sales for the fiscal year just ended being reported as 35 per cent. in advance of those of the previous year.

The sales convention held by this company from October 29 to 31, and which received brief mention in the November number of THE INDIA RUBBER WORLD, was attended by about 500 salesmen and branch and district managers. Following the usual procedure in such events, visits were made to the factory and addresses were made and discussions entered into on subjects particularly pertinent to the promotion of sales. Among the speakers at the convention were F. A. Seiberling, C. W. Seiberling, W. E. Palmer, H. S. Quine and W. D. Shilts—all officials of the company—C. H. Carlisle, of the Goodyear Canadian company, and C. C. Hopkins, of Lord & Thomas. Three special trains brought these representatives to Akron, and one feature of their visit which made a distinct impression upon the residents of the city was the parade from the hotel, across the city, to the Goodyear plant. The California representatives brought along as a mascot a real live bear, which attracted considerable attention ambling along in the procession; the men from the Chicago district were made up as minstrels, and the Southerners were in costume suitable to the climate of the South.

Of the 500 acres of land purchased two years ago by this company for the purpose of building homes for its employees at moderate cost, about 100 acres have so far been improved, divided into 432 lots of 50x100 feet and over. The 111 homes built about a year and a half ago have all been sold, building operations have been continued, and many lots have been purchased for homes to be erected next year. A block of 5 acres is to be laid out for an athletic field, and another of about 28 acres is to be devoted to a park system, probably to be later turned over to the city. Schools and churches have also been provided for, and the sale of intoxicating liquors within this district is forbidden.

* * *

The Akron Auto. Show will be held in the new O'Neil Building, at the corner of Church and South Main streets, from December 12 to 19.

Mr. Holcomb, of the Kelly-Springfield Tire Co., is able to be back at his office after a continued and severe attack of inflammatory rheumatism.

C. N. McCreery, of Akron, has been appointed assistant manager of the Western district of the Goodyear Tire & Rubber Co.

C. A. Dunham is in charge of the sales of the Cleveland territory of The B. F. Goodrich Co.

* * *

Frank J. Breiner, for 25 years an employe of the Whitman & Barnes Co., of this city, died November 16 in Winterhaven, Florida, after a brief illness. He was born in Akron in 1856. He is survived by his wife and three children.

William Smith, manager of the National Tire & Rubber Co., of East Palestine, Ohio, died at his home in Salem, Ohio, November 17, of heart disease, at the age of 54 years.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE past month has witnessed a gradual, though possibly slow improvement in the general conditions in the local rubber situation. More operatives have been called into the factories because of additional orders, and the restoration of confidence and the normal effect of approaching winter on footwear goods. The most noticeable effect, however, was attributable to the lowering price of crude rubber to a considerable extent, due to the destruction of the German commerce destroyer "Emden" and the bottling up of the "Koenigsberg." Immediately following this news being received, there was a decided lessening on the tension which had controlled the market, and local factories were assured of the stock necessary to complete orders, or to meet future demands. Whereas there were only about 50 per cent. of the rubber workers throughout the State under pay at the beginning of November, the close of the month finds upwards of 65 to 70 per cent. employed, with promising prospects of many more joining the active ranks in a short time.

* * *

Among the concerns in this vicinity that have been directly benefited by the European war is the Atlantic Tubing Co., Knightsville, through the demand for its flexible metal tubing. The largely increased orders for these goods, which heretofore have been largely imported from Germany, has resulted in this department of the plant being operated evenings, with prospects of a continuance of night work for an indefinite time. Much secrecy is maintained by the company, not only as to the methods used in the manufacture of this flexible tubing, but also in regard to the machinery used and the destination of its large shipments.

* * *

The affairs of the Walpole Tire & Rubber Co. continue to have special interest in this vicinity through the close connection with the suspended Atlantic National Bank of this city; in fact the claims of the Atlantic bank are among the heaviest liabilities of the Walpole company. At a recent hearing on the claims of the Atlantic bank before the special master, Emory J. Gibbs, at Boston, who was appointed to hear claims against the Walpole company, the amount accredited to the bank was considerably increased. The hearing was held on the motion of the counsel for the receivers of the Walpole company, who wanted the claim of the Atlantic bank cut down about \$3,000. Counsel for the bank, however, made a counter-motion that the claims of the bank against the Walpole company be increased by \$2,500. Later the receivers of the Walpole company withdrew their motion that the claim be decreased, and consented to allow the increase asked for. This means that the Atlantic National Bank

now has a claim against the Walpole Tire & Rubber Co. amounting to \$168,000.

* * *

The manufacture of carriage cloth at the factory of the International Rubber Co., at West Barrington, is up to the average of the busiest season of the concern. There are plenty of orders on hand, and to fill these contracts it is found expedient to operate a portion of the calendaring department at night. There is said to be work enough for several months in sight.

* * *

A number of important changes and improvements are being made at the factory of the National India Rubber Co., at Bristol, which means increasing by a large quantity the production of lawn tennis shoes. The plans call for a considerable outlay of money, but the indications are that with the tennis shoe industry of the United States Rubber Co. concentrated at Bristol, the activities at that plant will be materially increased. During the month several changes have been made in tennis lasts.

A new storehouse is being arranged in the center of the plant, a three-story building formerly used in connection with the packing department being utilized in the improvement. A new brick structure is being erected at the north end of the factory to connect the new machine room with the next building, which is used as a stitching room.

Among the wealth of floral tributes at the funeral of Miss Beatrice Colt, daughter of United States Senator LeBaron B. Colt, and niece of Samuel P. Colt, president of the United States Rubber Co., was a massive standing wreath and base made of orchids, lilies-of-the-valley, and pink roses, which was sent by the 2,000 employes of the National India Rubber Co. It was about seven feet in height. A large and beautiful basket of pink roses was sent from the officers and salesmen of the company, and a large standing wreath and base of roses and other flowers by the clerks in the office.

Col. Samuel P. Colt has recently purchased two estates at Poppasquash, which he intends to improve and add to his holdings in the vicinity of Mill Gut, which the land adjoins. One estate contained more than twenty acres and the second about twelve acres.

Among the nearly 2,000 individual firms and corporations to affiliate themselves with the Providence Chamber of Commerce during the membership campaign, recently held, were Hope Rubber Co., the Hayward Rubber Co. and the Davol Rubber Co. Other concerns were previously enrolled in the membership list.

* * *

The Revere Rubber Co., of this city, the local factory of the United States Tire Co., has been operating its plant overtime for several weeks because of large orders received from the several countries that are banded together in the great struggle against Germany and Austria-Hungary, and expects to be favored with many more large contracts. Harlow W. Waite, the local manager, has recently been in New York in this connection, and states that a number of large shipments of automobile trucks and solid tires for the Allies in Europe are now being contracted for, one including 6,000 solid tires being for practically immediate shipment. This, it is claimed, is too large for one concern to handle in the short time allowed before the delivery must be made. As large shipments have already been made from the Revere factory here, the solid tire department having been working overtime for a considerable period, Mr. Waite states that he expects the local concern will get a good-sized third of the order.

* * *

A creditors' petition in bankruptcy was filed in the United States District Court, in this city, on October 26, against the Cataract Rubber Co., having an office on Exchange street, in the National Exchange Bank Building. Robert S. Emerson was appointed receiver for the estate by order of Judge Arthur L. Brown. It is alleged in the petition that the company

admitted in writing its inability to pay its debts. The petitioning creditors, with the amounts claimed due, are as follows: Manhasset Manufacturing Co., \$3,432.07; Frank A. Cushing, \$259.50, and Blackstone Webbing Co., \$479.13. The Cataract Rubber Co., it is stated, is not connected with, and should not be confused with the Cataract Tire Co., at 49 Broad street, this city.

THE RUBBER TRADE IN CHICAGO.

By Our Regular Correspondent.

THE rubber trade in this city has been in a rather uncertain condition for the past month. In some respects general business conditions have been favorable; in others they have been adverse. The situation in the Far East has been subjected to close and constant scrutiny by the trade here. The rubber men realize that they must look in this direction for price conditions, and they are gauging their own plans by developments in that quarter.

Word of the sinking of the German cruiser "Emden" in eastern waters recently caused a much easier feeling in the rubber trade here, not because of any sentiments which might be classed as unneutral, but because this elusive man-of-war had been raising havoc with rubber shipments out of Singapore and other eastern ports.

The mild weather has not been good for the rubber clothing trade, and dealers handling these articles are in no better position than they were a month ago when the situation was given a canvass. They are certain that real winter weather, with plenty of snow, rain and slush, will cause a rapid improvement in the situation, and they are also sure that such conditions cannot be far away.

The capacity of W. H. Salisbury & Co., Inc., of 105 South Wabash avenue, this city, was put to a sharp test one day recently when representatives of the Union Stockyards & Transfer Co. placed with them an order for 20,000 feet of rubber hose of a specified size to be ready for delivery within 24 hours, all cut into various designated lengths. The stockyards had been closed on account of the hoof and mouth disease among the cattle, and this hose was needed to comply with government orders, which were to disinfect every inch of the pens, including the fences, posts and pavements.

"There was a brief discussion," said Richard H. Geier, general manager of the company, "and we decided that by keeping the entire force on the job the greater part of the night we could fill the order in the time required. I say with pride that all of the boys and some of the girls in our establishment volunteered for the work with great enthusiasm, and an hour before the stated time we were ready with the hose, cut into the proper lengths. We felt that it was more or less of a patriotic matter to use our best efforts in assisting to stamp out this dread disease, which threatened for a time to seriously cripple the cattle industry in the West."

Most of the repair work in the grain elevators is over for the present and there is not the same amount of activity in the rubber belting lines that there was a few weeks ago. However, the strain placed upon some of the northwestern elevators in handling the great grain crop has resulted in more than the usual number of hurry orders for equipment.

Considerable discussion has been created among the mechanical rubber men of the city by an announcement that the price of narrow rubber belting containing cotton is soon to be increased. There is little doubt in the minds of the local dealers that the cost of a narrow belt is considerably more than half that of a belt twice as wide; the proportion is nearer two-thirds,

in the estimation of mechanical rubber men of this city. Therefore the change will meet with little protest from this quarter.

* * *

Rubber men here were enthusiastic on hearing early this week of the plan which had gone through at the trade meeting of representatives of commercial organizations held at Memphis, Tennessee, to establish branch banks in South American countries for the encouragement of commerce with the United States. This means that it will be possible for rubber manufacturing firms in this country to establish trade with dealers in the southern continent. The Chicago Association of Commerce was represented at the meeting in Memphis, and the rubber men of the city who belong to that enterprising body have taken a keen interest in the proceedings. Establishing banks is the first move in the campaign. It is believed that it will be possible, now that competition is less keen, owing to the war, to build up a satisfactory trade out of Chicago. The route will be by rail to New Orleans, and from that point by steamer down along the eastern coast or through the Panama Canal along the western seaboard. The cost will not be much greater than on shipments to points in California under the present rates on roads running west out of this city.

A. Romain, the sales manager of the Quaker City Rubber Co., which manufactures mechanical rubber goods, discussing the situation, said: "In a business like ours we must look at matters in a broad light, otherwise we cannot get the right perspective. I regard the establishment of the Federal Reserve Banking System as one of the most encouraging things that has happened to the rubber trade of this city in some time. The city has been made the center of one of the big reserve banks, and that is bound to attract and stimulate capital for all commercial enterprises to this point."

Manufacturers of pianos and piano player actions in this city have put up a cry of distress on account of a feared shortage in the particular grade of rubber tubing which they use in the manufacture of their product. They have been paying advanced prices without much complaint, and their fears were excited by a letter sent out by a prominent supply house stating that an unfavorable turn of affairs in the eastern theater of war might result in the complete depletion of the supply of rubber available for the manufacture of rubber tubing. The tubing used by the piano men must be of a certain fine quality; no other kind will do. In the manufacture of player actions large quantities are used, as it is necessary, on account of the bellows device, to have conduits which will conduct the compressed air to the points where sound is produced. Large manufacturers of player actions in this city are the Gulbransen-Dickinson Co., the Sonorus Piano Player Co., and the Schubert Piano Co., the last named concern also having an office in New York.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

AS a manufacturing center Trenton has come to be recognized as one of the most important of the cities of the east, and its lines of production are both varied and extensive. The manufacturers of the city are co-operating with the local Chamber of Commerce for an exhibit of Trenton products at the Panama-Pacific International Exposition, which opens in San Francisco, February 20 next, and this display will probably give further recognition to the city and its industries. There will be a "Trenton Day" at the exposition, extensively advertised. The space allotted to the Trenton section is close to the Court of Honor, in the Palace of Manufactures. Among the rubber companies that have so far contracted for space are the Home Rubber Co. and the Essex Rubber Co. The exhibits are now being prepared and collected at the Second Regiment Armory, where they will be on display from

December 7 to 15, immediately after which they will be shipped to San Francisco. The proceeds from admission to the San Francisco exhibit will be contributed to the National Red Cross fund for the relief of European war victims.

No work in this city of industries is being carried on more industriously at present than that of collecting funds and supplies for the relief of the Belgians. The ruthless invasion of this peaceable country and the wanton destruction of life and property, with the consequent hardships entailed on survivors, have aroused universal sympathy, which is being expressed in the practical form of donations to assist in relieving these sufferings. The Belgian relief work here is well organized. Committees have been appointed in every line of industry to solicit and receive contributions. Clothing has been collected by the women's committee, and two large boxes of warm clothes were forwarded to Liverpool in care of Ernest E. Buckleton, of the Northwestern Rubber Co. of that city, who visited Trenton a few weeks ago in the interest of Belgian relief. The rubber mills' committee consists of A. Boyd Cornell, Charles H. Stokes, Clifford H. Oakley and Cornell Murray; while Frank W. Thropp and F. W. Roebling are on the committee for iron mills, machine shops, etc.

The Braender Rubber & Tire Co., of Rutherford, New Jersey, has just put on the market a new non-skid tire. This new tread, as will be seen in the illustration, is of the combined raised and depressed type. It retains the fishtail cross bars of the original Braender "Bull Dog" non-skid, and has in addition six heavy webs of rubber so placed between these bars as to give more rubber on the tire, with more surface to take the wear. The addition of these webs overcomes the tendency to skid and in combination with the cross bars insures a continuous and smooth riding surface. The new "Bull Dog" will be exhibited at the January automobile shows in both New York and Chicago.

At the Inter-State Fair recently held in New Jersey the Essex Rubber Co. had an interesting exhibit of rubber heels and soles. One feature which attracted attention at this exhibit was a barrel full of rubber heels. Prizes were awarded for the nearest guess to the number of heels contained in the barrel. One visitor guessed the exact number, 1,896 heels, winning a first prize of \$5.

A permit has been granted the Globe Rubber Co., Trenton, for a new factory building 72 x 59 feet, two stories high.

A threat to blow up the plant of the American Rubber Co., of this city, recently made by Peter Flood, a former convict who had been refused work in the plant, was followed by the arrest and conviction of Flood, with a sentence of one year in the workhouse.

At the meeting of the Board of Managers of the Sons of the Revolution in the State of New Jersey, on November 12, Frederick F. Katzenbach, vice-president of Katzenbach & Bullock Co., Inc., manufacturers of chemicals for the rubber trade, was received to membership. Mr. Katzenbach traces

his ancestry back to Lieutenant Imlay, of Monmouth County, New Jersey.

The Board of Trade of New Brunswick, in a recent advertisement, calls attention to the lack of proper housing facilities for workmen in that city. The enlargement of the India Rubber Co.'s business has brought ten new families to the city, and difficulty is being experienced in securing proper accommodations for this increase in population.

The Rutherford Rubber Co., of Rutherford, New Jersey, has moved its New York branch from West Forty-second street up to the automobile district at Fifty-second street, being now located at 1668 Broadway. This company, which manufactures the Sterling Vacuum-Bar tire, sells direct to the user, maintaining factory sales branches in the principal eastern cities.

The factory building at Harrison, New Jersey, formerly occupied by the Greenfield Engine Co., has been leased by the Auto Tire & Tread Co. for manufacturing purposes.

SOME RECENT CUSTOMS RULINGS.

The Board of General Appraisers on November 4 affirmed the classification of the customs authorities on raincoats imported by M. L. Rothschild & Co., of St. Paul and Minneapolis, as cotton wearing apparel, under the old tariff. The importers claimed classification under manufactures of rubber, on which the rate is 35 per cent. ad valorem, but the evidence showing that while rubber predominated in weight of the garments cotton was of the greater value, the 50 per cent. rate was imposed.

A decision rendered on November 5, also affirming the original customs classification, places elastic braid composed of silk and rubber threads under the classification "braids, composed of yarns, threads or filaments," on which the rate is 60 per cent. ad valorem. The protest against this classification was made by Calhoun, Robbins & Co., New York, who contended that rubber was the component of chief value in the braids and that in its condition in the braids it was neither a yarn, thread nor filament, but this protest was overruled and the contention denied.

Brooches of hard rubber, returned by the Collector at 60 per cent. ad valorem, under the act of 1897, as jewelry, have been reappraised by the Board, which classifies them as manufactures of hard rubber, entitled to enter at 35 per cent.

A SMALL TOOL FOR MAKING A WIRE CLAMP.

There are a good many places where a wire clamp if made tight and enduring is exceedingly serviceable, as, for instance, in clamping a piece of hose or fixing a blowout, in holding together a wooden pail when the hoops have grown loose or been lost and for fastening a steel spring that has become broken. R. A. Beaudette & Co., of Chippewa Falls, Wisconsin, have recently put on the market a little tool called the Rab Wire

Clamper which makes it possible to put a wire clamp wherever it may be needed very quickly and easily. The wire is bent in the form of a loop and put around the article to be clamped, the free ends pulled through the loop, and then by the use of this small tool, which is quite inexpensive, the wire is drawn taut and bent over and clamped and cut. The accompanying illustrations show the use of wire clamps as fastened by this tool in repairing a tire and in clamping a piece of hose. Beckley Ralston, of Chicago, is the distributor.

News of the American Rubber Trade.

CHARLES T. WILSON CO., INCORPORATED.

ON November 1 the business of Charles T. Wilson, importer of and dealer in crude rubber at 46 Cortlandt street, New York, was transferred to the Charles T. Wilson Co., Incorporated, all unfilled contracts and obligations being assumed by the new concern. This company, of which Charles T. Wilson is president and Henry Perlsh vice-president, is incorporated under the laws of New York with an authorized capital stock of \$250,000, of which they state that \$210,000 has been issued and paid in.

THE T. H. & B. CHEMICAL CO.

Having sold his interest in the firm of Ernest Jacoby & Co., manufacturers of rubber substitutes, with factory at South Boston, Mr. Ernest Jacoby has resigned his position as an officer of that company. The business will be continued as heretofore, under the name of the T. H. & B. Chemical Co., with offices at Hyde Park, Massachusetts, and Mr. Jacoby will continue to sell its products.

THE RUBBER RECLAIMERS' ANNUAL MEETING.

The annual meeting of the Rubber Reclaimers' Club was held at the Hotel Vanderbilt, New York, on November 5. Francis H. Appleton was re-elected president, R. W. Seabury was re-elected treasurer, and Lloyd E. Appleton was elected secretary, succeeding J. Norman. The club is in a very healthy condition and its monthly meetings for the exchange of views on the reclaiming industry are largely attended.

ANNUAL REPORT OF THE BOSTON WOVEN HOSE & RUBBER CO.

The annual report of the Boston Woven Hose & Rubber Co. shows total assets on August 31 valued at \$3,710,036, or a value of \$171,700 in excess of assets on the same date last year; while the surplus shows a gain of \$177,869, standing at \$1,460,042 in the last report, against \$1,282,174 in 1913. The assets include cash and debts receivable to the amount of \$913,564, and the liabilities include accounts payable \$48,304, with a floating debt of \$348,000.

This company has declared a regular semi-annual preferred stock dividend and a regular quarterly common stock dividend of \$3 per share, payable December 15 to stockholders of record on December 5. It also declared an extra dividend of \$25 a share on common stock, payable November 27 to stock of record on November 23, offering to common shareholders the privilege of subscribing to 2,500 shares of new common at par, in the ratio of one share of new for each four shares held of the old issue.

A CHANCE TO VISIT SOUTH AMERICA.

The Travelers' Department of the Fidelity Trust Co. of Baltimore has chartered the steamship "Finland" for the purpose of taking a party of manufacturers, exporters, importers, and others on a tour, lasting 106 days, of the principal ports of South America. The ship will sail from New York January 27, and from Baltimore two days later; will visit all the important ports in the southern continent, and return home by way of the Panama Canal. This trip is promoted for the purpose of giving American business men a chance to acquaint themselves with the business opportunities in South America.

WELLINGTON, SEARS & CO. SECURE GOVERNMENT ORDERS.

Government orders for about a million yards of cotton duck have recently been received by Wellington, Sears & Co., of Boston—manufacturers and exporters of ducks, sheetings, drills, etc., especially suited to the needs of the rubber trade—from the European countries now involved in war. The French government alone has ordered, through the company's agency in Great Britain, half a million yards, presumably for army purposes.

RAW MATERIAL AND THE EUROPEAN WAR.

The terrible struggle now going on in Europe, and the consequent disruption of general commercial and manufacturing conditions, has brought in its train a lesson now receiving the serious consideration of most American manufacturers—that of the danger of dependence on supplies from over sea. The attention of manufacturing trades—including rubber—is of necessity turned to the availability and extent of domestic sources of supply of a dependable and reliable character. The recent mining of the waters around the British Isles creates a situation which is likely, among other things, to have a restrictive influence on the importation of chalk, on which the manufacture of whiting is dependent, and is already affecting the market for deliveries over next year.

The Industrial Chemical Co., of 200 Fifth avenue, New York City, which for many years has been studying the requirements of the rubber manufacturing industry, has now perfected its special brand of "Alba Whiting" to such a degree as to make it a most efficient compounding material in the manufacture of rubber goods. The largely increased demand from the trade has fully justified the company's policy of expansion in erecting a thoroughly up-to-date plant under scientific management, providing a means of doubling the present output and so placing the company in a position to guarantee regularity of supplies, in anticipation of an additional demand for material entirely of American origin. Alba Whiting has been on the market for over ten years, but its use has greatly increased during the last three years. There are now over 80 rubber manufacturers who are using this ingredient in their compounding.

THE FISK RUBBER CO. MAKES A RED TOP TIRE FOR FORD CARS.

The Fisk Rubber Co., of Chicopee Falls, Massachusetts, is making a non-skid tire with red top and white side walls for use on Ford cars. This tire is made only in sizes 3 x 30 inches and 3½ x 30 inches. The tread has additional thickness and is claimed to ride as smoothly as a plain tread and without any bump and vibration. A letter received November 13 by the Fisk company from one of its representatives in Arizona states that he had just examined a set of red tops on a Ford car used in automobile stage service through the desert that had traveled approximately 6,000 miles and looked good for fully as many miles more.

MONATIQUOT RUBBER WORKS CO. APPOINTS NEW AKRON AGENT.

The Monatiquot Rubber Works Co., from its Boston sales office at 176 Federal street, announces that James C. Baldwin, of Akron, Ohio, has been appointed agent in that state for "Naturized" Rubber, the product of the Monatiquot plant at South Braintree, Massachusetts. The company has heretofore been represented in that section by L. Y. Croft.

RUBBER COMPANY DIVIDENDS.

The Goodyear Tire & Rubber Co., of Akron, at a quarterly meeting held Monday, November 2, declared an annual dividend of 12 per cent. on the \$8,000,000 common stock of the company.

The Swinehart Tire & Rubber Co., of Akron, has declared a regular quarterly dividend of 1½ per cent., payable Jan. 15 to stock of record Dec. 15.

The B. F. Goodrich Co., of Akron, has declared a regular quarterly dividend of 1¾ per cent. on its preferred stock, payable January 1 to stockholders of record on December 21.

CAPITALIZATION CHANGES.

The Star Rubber Co., of Akron, Ohio, has increased its capital stock from \$100,000 to \$200,000.

The Excel Rubber Co., of Akron, Ohio, has increased its capital stock from \$10,000 to \$30,000.

SUIT AGAINST INDIANA RUBBER & INSULATED WIRE CO. DROPPED.

The suit brought against the Indiana Rubber & Insulated Wire Co., of Marion, Indiana, by the Buffalo Specialty Co., of Buffalo, New York, to enjoin the former company against alleged infringement of rights in a tire fluid, has been dismissed in the United States District Court at Indianapolis. The patent for this fluid was purchased by the Indiana concern from the inventor, and in turn sold to the plaintiffs in this action, whose complaint charged that after the sale the defendants had made fluid as covered by the patent.

MORE COMPANIES TAKE SPACE FOR JANUARY AUTOMOBILE SHOWS.

On page 82 of the November number of THE INDIA RUBBER WORLD mention was made of space having been allotted to a number of companies engaged in rubber and allied manufactures in the automobile shows to be held at New York and Chicago January 2-9 and 21-30. Several other companies have since been allotted space. These include: The Cutler-Hammer Clutch Co., Milwaukee; The Dreadnaught Tire & Rubber Co., Baltimore; the Globe Rubber Tire Manufacturing Co., Trenton; the Standard Woven Fabric Co., Framingham, Massachusetts, and the Newmastic Co., New York.

The following concerns have taken space for the New York show only: Essex Rubber Co., Trenton; Rutherford Rubber Co., Rutherford, New Jersey; the Marathon Tire Sales Co., New York—a branch of the Marathon Tire & Rubber Co., of Cuyahoga Falls, Ohio; the Steel Pneumatic Tube & Tire Co., New York; the O'Bannon Corporation, Providence, Rhode Island, and the Ashley Wire Wheel & Rim Co., New York.

DECISION AND AWARD IN WEED TIRE CHAIN SUIT.

A perpetual injunction has been issued by Judge Tuttle in the United States District Court at Detroit in the suit brought by the Weed Chain Tire Grip Co., the Parsons Non-Skid Co., Limited, and Henry D. Weed, restraining the Perry Chain & Grip Co., the Union Steel Screen Co. and the Motor Specialty Co. from the manufacture of tire chains which infringe patent No. 723,299 issued to Henry Parsons March 24, 1903. The plaintiffs in the case were awarded \$18,000, to cover costs of the suit and the profits which the defendants had made from sale of devices infringing this patent.

IMPORTING FIRM ASSIGNS FOR BENEFIT OF CREDITORS.

Fred'k Probst & Co. (Adolph Victor), trading and commission merchants, of 82 Beaver street, New York, made an assignment on November 11 for the benefit of creditors, with liabilities approximating \$1,000,000. This business was established in 1845, by Probst & Memeristaza, who were later succeeded by Fred'k Probst & Co., Mr. Victor obtaining ownership in 1897. Included in the assigned estate are property rights in a large block of timber land in the State of Campeche, Mexico; right, title and interest in a plantation in the State of Chiapas, Mexico, and a plantation in the City of Coban, Guatemala, also a mortgage on property in the city of Vera Cruz. This assignment is said to have been caused by the encumbrance of \$200,000 of the firm's funds by the general manager and cashier, William F. Bostelman, who committed suicide on November 21.

THE SOUTHERN TIRE & RUBBER CO. TO MAKE TIRES.

Another new concern about to enter the field of rubber manufacture is the Southern Tire & Rubber Co., of Augusta, Georgia, which expects to be ready to start work by about the middle of December. This company, which is capitalized at \$75,000, has a new brick plant at Augusta, in the vicinity of the Armour fertilizer works. This plant—the main portion of which is 52 x 230 feet in area, and which has an addition 30 x 60 feet—with its equipment, is said to represent an outlay of approximately \$70,000. This equipment has already been installed. The company purposes manufacturing automobile tires, employing from 12 to 15 workmen at the start, with a capacity of about 50 tires a day.

TRADE NEWS NOTES.

The Cutler-Hammer Clutch Co., of Milwaukee, Wisconsin, well known in most of the large American rubber factories as the manufacturer of the Cutler-Hammer Magnetic Clutch and Brake, has removed its Cincinnati office from the Fourth National Bank Building, taking larger quarters in the Gwynne Building.

A visit of inspection was recently made by representatives of the East Palestine Rubber Co. to the plant at Clyde, Ohio, formerly occupied by the General Motors Co., its suitability as a supplementary tire factory to the company's plant at East Palestine, Ohio, being under consideration.

The Superior Tubes & Accessories, Limited, has been incorporated at Toronto, Ontario, with a capital stock of \$300,000, to manufacture automobile equipment, etc. The incorporators are W. A. J. Case, J. B. Taylor and C. G. Lynch, and the principal office of the company is at Toronto, 1201-5 C. P. R. Building.

By arrangements recently effected, the H. W. Johns-Manville Co., of New York, has taken the exclusive distributing agency for "Tirenew" and "Narco," products of the National Rubber Co., of St. Louis, Missouri. These products, which are rubber compositions intended respectively for coating tires and for tire filler, will hereafter be known as J-M Tirenew and J-M Narco.

According to an announcement made by the Business Men's Association of Findlay, Ohio, the newly formed Toledo-Ford Tire Co. will locate in that city, manufacturing a line of tires exclusively for Ford cars, to be sold direct to the users. The company states that it expects to be able to sell at 25 per cent. below usual price.

The Pneumatic Hub-Tire-Wheel Co. has been incorporated under the laws of Delaware, with a capital stock of \$5,000,000, by L. C. Evans, G. J. Lampton and N. W. Rowland—all of Louisville, Kentucky—with the purpose of erecting a factory as soon as satisfactory arrangements can be effected.

A demand has been made upon George D. Porter, Philadelphia's Director of Public Safety, by a committee appointed by the Rotary Club of that city, for an immediate test of the fire hose in use there. In spite of assurances of Councils that the hose is all right, repeated charges have been made that the city's fire hose is in bad condition and liable to burst at any time, and the manufacturers consider it their right and a matter of importance to themselves to know that this public equipment is in first class shape.

Judge Dodge of the United States District Court of Massachusetts recently denied the petition of the Harris Raincoat Co., of Boston, for the sale of the assets of the Oxford Rubber Co., of Cambridge, Massachusetts, the receiver of the Oxford company assuring the court that he would soon present a similar petition.

The plant of the Fisk Rubber Co., at Chicopee Falls, Massachusetts, which was closed during the first week of November for annual inventory, reopened on the 9th.

The Williams Tire & Rubber Co., which recently acquired property at Vista, near McKeesport, Pennsylvania, on which to erect a plant for the manufacture of tires and other rubber goods, expects to have ready for operation by Spring a factory which will require the services of 500 workmen. Work on this new plant is very soon to begin. A. D. Williams, president of the company, of Glassport, Pennsylvania, is quoted as stating that \$60,000 of the new \$255,000 stock issue of the company—formed last September—has already been subscribed for.

A convention of the sales force of the Standard Woven Fabric Co. was recently held at the company's factory at Framingham, Massachusetts. A convention address by the general manager, Mr. Burdick, discloses a very satisfactory business for the past year, the sales of "Multibestos" brake lining during that time having doubled.

NEW INCORPORATIONS.

Atlantic Rubber Co., October 22, 1914; under the laws of Delaware; authorized capital, \$250,000. Incorporators, E. C. Boyd, Norman P. Crouch and Horace J. Joslyn—all of Wilmington, Delaware. To manufacture and deal in the products and by-products of rubber.

Brazilian Rubber & Manufacturing Co., October 30, 1914; under the laws of Illinois; authorized capital, \$5,000. Incorporators, Edward Graff, Simon La Grou and William E. Rafferty. Principal place of business, 105 West Monroe street, Chicago, Illinois. To buy and sell at wholesale and retail, rubber clothing and general merchandise.

Cut-Rate Tire Co., The, October 1, 1914; under the laws of Tennessee; authorized capital, \$3,000. Incorporators, P. J. Quigley, A. N. Sullivan, R. J. Quigley, J. G. Weatherford and V. G. Peace. To buy, sell, exchange, repair and otherwise engage in the automobile tire business.

Hood Tire Co., November 3, 1914; under the laws of Massachusetts; authorized capital, \$20,000. Incorporators, Charles W. Dailey, Jr., Robert Muir, Herbert E. Rose, Herbert C. Mason and Edward I. Aldrich—all of Watertown, Massachusetts. To deal in tires, rims and wheel equipment for motor or other vehicles.

Humphrey-Kennard Co., The, October 19, 1914; under the laws of Ohio; authorized capital, \$10,000 divided into 100 shares of \$100 each. Incorporators, J. R. Humphrey, Floyd E. Waite, Chas. A. Colvin, E. G. Hoag and L. M. Sewell. To buy, sell and deal in rubber tires, etc.

Lyon Tire & Rubber Co., October 15, 1914; under the laws of Illinois; authorized capital, \$10,000. Incorporators, A. W. Lemke, LeRoy Harriss and W. B. Lathrop. To manufacture, buy, sell and exchange automobile tires, tubes and other automobile accessories.

Mattson Rubber Co., November 12, 1914; under the laws of New Jersey; authorized capital, \$200,000. Incorporators, John Behrens and John Henry Behrens—both of Hasbrouck Heights, New Jersey—and Henry Lemmermann, Bronxville, New York. To acquire, sell, trade, deal in and with rubbers and rubber goods of all kinds, including automobile tires, inner tubes, etc.

Mohawk Supply Co., The; September 30, 1914; under the laws of Ohio; authorized capital, \$2,500 divided into two hundred and fifty shares of \$10 each. Incorporators, F. F. McGinness, William Hartman, C. P. Bidinger, F. J. Rockwell and G. B. Owens. The principal place of business is Akron, Ohio. Jobbers and retailers of rubber goods and supplies.

Needham Tire Co., October 22, 1914; under the laws of Massachusetts; authorized capital, \$350,000. Incorporators, John S. Patterson, Cambridge; James M. Patterson, Winchester; William H. Burgess, Howard W. Lang and W. Louis Williams—of 50 State street, Boston—all in Massachusetts. To manufacture and sell automobile tires and inner tubes.

Non-Pneumatic Suspension Tire Co., The; October 14, 1914; under the laws of Ohio; authorized capital \$10,000, divided into 100 shares of \$100 each. Incorporators, Anthony Schemel, George Wehrfritz, F. H. Goosmann, C. W. Mackenbach and H. Serkowich. Principal place of business Cincinnati, Ohio. To manufacture automobile tires, rims and accessories.

Penn Rubber Traffic Co., November 9, 1914; under the laws of Delaware; authorized capital, \$150,000. Incorporators, William Boyd, W. I. N. Lofland and W. F. P. Lofland—all of Dover, Delaware. To manufacture and deal in automobile tires and inner tubes, rubber sundries, etc.

Penn Square Tire Reclaiming Co., The; October 23, 1914; under the laws of Ohio; authorized capital, \$10,000 divided into 100 shares of \$100 each. Incorporators, L. H. Heller, Otto A. Erb, Jos. F. Krajewski, I. Graner and Nathan Herstam. To manufacture, buy and sell, at wholesale and retail, automobiles, automobile accessories and supplies.

Pneumatic Hub-Tire-Wheel Co., October 22, 1914; under the

laws of Delaware; authorized capital, \$500,000. Incorporators, G. J. Lampton, N. M. Rowland and L. C. Evans—all of Louisville, Kentucky. To erect manufactories and workshops for the manufacture of automobile wheels and tires.

Safety Signal Co., Inc., October 27, 1914; under the laws of New York; authorized capital, \$200,000. Incorporators, Arthur W. Dennen and Stanley C. Fowler—of 19 Cedar street—and Rebecca Hilliker, 80 Maiden Lane—all in New York City. To manufacture devices for automobiles, rubber goods, etc.

Safety Tread Co., Inc., The; November 13, 1914; under the laws of New York; authorized capital, \$20,000. Incorporators, Paul P. Crosbie, 29 Broadway, James A. Edwards, 32 Liberty street—both of New York City—and Raymond E. Hartley, Mountain View, New Jersey. To manufacture rubber stair treads, etc.

Sponge Rubber Inner Heel Co., October 23, 1914; under the laws of New Jersey; authorized capital, \$25,000. Incorporators, Albert Ensor, Sr. (president and treasurer), and William J. Broidy—both of Paterson—and W. Beebe Price (vice-president), West Nutley all in New Jersey. To manufacture and sell detachable ventilators for boots, and the like, and to purchase and deal in all materials necessary for their manufacture.

Standard Tire & Rubber Co., November 10, 1914; under the laws of Delaware; authorized capital \$250,000. Incorporators: F. R. Hansell, Philadelphia, Pennsylvania; George H. B. Martin and S. C. Seymour, of Camden, New Jersey. To buy, sell and manufacture all articles necessary to, or used in the management, running and operating of automobiles.

Tator Co., Inc., Arthur R., October 28, 1914; under the laws of New York; authorized capital, \$1,000. Incorporators: Arthur R. Tator, 1051 Prospect Place; Hugh F. Foster, 617 McDonough street, and John F. Undutsch, 1051 Halsey street—all in Brooklyn, New York. To deal in autos, tires, etc.

Traver Puncture Proof Tire Co., Inc., November 9, 1914; under the laws of New York; authorized capital, \$400,000. Incorporators, Gustave Koenig and Lena Koenig—both of 10 Mott avenue—and Philip C. Traver, 6 Pearl street—all in Far Rockaway, New York. To manufacture tires, etc.

United Supply Stores, Inc., November 6, 1914; under the laws of New York; authorized capital, \$5,000. Incorporators: Arthur S. Stein, 197 Palisade avenue, Jersey City, New Jersey; Louis G. Duquet, 107 West Thirty-sixth street, and Arthur W. Chatfield, 312 West Fifty-second street, New York City. To deal in tires, rubber goods, auto accessories, etc.

TRADE NEWS NOTES.

On December 1 the Rubber Trading Co. moved its office in New York City from 38 Murray street to 9-15 Murray street.

Contracts have been let for an addition to the factory of the Farrel Foundry & Machine Co. at Ansonia, Connecticut.

The Kansas "Pure Shoe" law, which was passed by the legislature in 1913, to become operative on April 1 last, has been declared constitutional by Judge A. W. Dana of the District Court at Topeka in that state. A suit to test the legality of this act was brought on petition of the Payne Shoe Co. of Topeka, in behalf of about 450 shoe retailers who are members of the Kansas Retail Shoe Dealers' Association.

A Customs House report on merchandise in bonded warehouse on the first of November contains the following details regarding chicle: Value in bonded warehouses within the District of New York, November 1, 1914, 266,115 pounds, valued at \$94,257, against 105,328 pounds, with a value of \$33,358 on November 1, 1913. The quantity in bond on October 1 was valued at \$103,629.

A. G. Spalding & Brothers, sporting goods manufacturers, have commenced work on an addition to their factory at Chicopee Falls, Massachusetts. The promotion of this work was delayed owing to the war, but present demands have shown the necessity for immediate increase of capacity.

WILMER DUNBAR.

MR. DUNBAR is not so very old—in fact he is only a few weeks beyond the forty-five-year mark—but he has had a variety of experience in the rubber industry which few men would secure even if they lived to the ripe age of Methuselah. If there is any doubt upon this point the details given below will dissipate it.

Mr. Dunbar was born in Johnsonville, Pennsylvania, in 1869 and while still a boy picked up a good deal of information regarding the pottery industry, then quite flourishing in that town. When he was fifteen he went to Trenton, New Jersey, hoping to get work in a pottery factory, but as he found no work of that character he looked about and soon got a position with the Star Rubber Co. The general manager took an unusual interest in the industrious country boy and assigned him to work in practically every department of the factory, so that at the very start of his rubber career he secured a wide range of information. When, in 1886, the Knights of Labor started a strike against this company, young Dunbar was one of the few who remained loyal. He stayed with this company for six years, leaving it in 1892 to go with the newly organized Eastern Rubber Manufacturing Co., now known as the Hamilton Rubber Manufacturing Co.

Here he remained until 1896, when he cast in his lot with the Diamond Rubber Co., then a \$50,000 corporation. He was made superintendent of its mechanical department. In the following year he installed a rubber department for The Whitman & Barnes Manufacturing Co. and became its first general superintendent. Two years later he was one of three men who organized the Alden Rubber Co., becoming its vice-president and general manager. After five years in this position he joined the Pennsylvania Rubber Co., as factory manager and general superintendent, and while in this position organized and equipped the Westmoreland Rubber Manufacturing Co. and, as its general manager, operated it very successfully in the production of reclaimed rubber. In 1909 he left these two companies and during the next three years was a general consulting expert and in that capacity built several reclaiming plants.

Early in 1912 he joined the McGraw Tire & Rubber Co. for the purpose of doing certain reorganization work, and having accomplished his purpose he retired after a few months and became identified with the East Palestine Rubber Co., of East Palestine, Ohio. While retaining his connection with this company, he organized, in February, 1913, the Greensburg Tire & Rubber Co. for the manufacture of inner tubes at Greensburg, Pennsylvania; and still later he became identified with the Dreadnaught Tire & Rubber Co., of Baltimore, Maryland, building and equipping its plant for the manufacture of automobile tires. He is at present associated with the three companies last named, being president of the East Palestine company, vice-president and general manager of the Greensburg company and also vice-president and general manager of the Dreadnaught company.

Notwithstanding all his wide experience in the manufacture and sale of rubber goods and the financing of rubber industries,

Mr. Dunbar's chief pride is in his ability as a rubber compounder.

Incidentally it might be mentioned that amid all these varied activities Mr. Dunbar found time, in May, 1890, to get married—to Miss Florence M. Peters, of Trenton. Evidently three is his favorite number, for he not only has the management of three different rubber companies, but he is the father of three boys and three girls.

PERSONAL MENTION.

Harvey S. Firestone, president and general manager of the Firestone Tire & Rubber Co., of Akron, recently subscribed for \$20,000 worth of second mortgage bonds of the Detroit Athletic Club. This organization, which has built a fine new club house, put \$60,000 worth of mortgage bonds on the market, \$40,000 of which were purchased by members and others interested in its success.

Frank Venn, the well known manufacturer of rubber footwear marking devices, has recently returned from a tour of Europe, where he was extremely successful in placing his machines. Mr. Venn also manufactures a marking ink in a variety of shades which he is sending to all parts of the world.

H. E. Taylor has been placed in charge of the branch which the Gibney Tire & Rubber Co., of Conshohocken, Pennsylvania, has opened at 1712 Michigan avenue, Chicago.

The United States Tire Co. has appointed Thomas Wilkinson manager of its Los Angeles branch. He is well acquainted with the trade of Los Angeles, having been associated in that city with the Hartford Rubber Works Co., before becoming manager of the San Francisco branch of the United States Tire Co.

Mr. Jesse Hawkins, who has been connected with the New York office of the United States Rubber Co. for a number of years, has just been appointed general manager of the Standard Rubber Shoe Co., of Chicago, succeeding Mr. Burt in that

position. Mr. Hawkins starts on his new duties December 1.

C. W. Heintz, who, on the resignation of B. F. Morris, was appointed manager of the Buffalo branch of the Republic Rubber Co., of Youngstown, Ohio, has been for the past five years connected with the company's sales office in New York.

R. W. White has been succeeded in the management of the Columbus, Ohio, branch of the Goodyear Tire & Rubber Co. by W. W. Magill, Mr. White having been promoted to the Chicago branch management.

L. M. Bourne has been appointed manager of the factory of the Double Fabric Tire Co., at Auburn, Indiana. Mr. Bourne was for six years associated with the Goodyear Tire & Rubber Co., as assistant production manager and in charge of the laboratories of the experimental department.

Charles L. Benjamin, advertising manager of the Cutler-Hammer Clutch Co., of Milwaukee, Wisconsin, was the guest of honor and principal speaker at a meeting on October 7 of the Advertisers' Club of Milwaukee. His subject was "Business Building Through the Business Press."

WILMER DUNBAR.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

CAPTURE OF GERMAN TRADE.

THIS subject I note is attracting considerable attention in America as well as in England, and it is obvious that the two countries are engaged in serious, albeit friendly, rivalry. As THE INDIA RUBBER WORLD is quite open as to America's aims and aspirations there is no reason why I should not be equally frank in referring in a general way to what is being done or aimed at on this side. One principal difficulty seems to lie in the objection to imitating German methods, with regard to which situation we have been brought to task time after time by our consular service. I refer more particularly to the employment of travelers speaking foreign languages, the issue of price lists in the language and currency of the foreign countries, the supply of cheap qualities where better goods are not desired and better credit accommodation. Whether the business is worth having when these points are considered is a matter on which much doubt exists in the minds of individual manufacturers, and it is they who have to decide, as, although the Board of Trade is very active at present in its Intelligence Department, this activity extends no further than the obtaining and passing on of information.

One of the latest bulletins issued by the board relates to the export trade of Germany and Austria-Hungary in rubber goods in neutral markets. This shows that the maximum amount of trade which might be diverted to British manufacturers from their German and Austrian rivals amounts to £870,000 (\$4,350,000) in the United Kingdom market and £2,819,600 (\$14,098,000) in Colonial and neutral markets. These figures, I must add, do not include machinery belting, toys and tires for motor cars, motorcycles and bicycles. It is said that 75 per cent. of the solid bus tires used in London are of German make, showing what an important opportunity exists for the expansion of British trade. It would be interesting to know what is the state of affairs in the large German towns with regard to British tires—probably it is much more in favor of the home country.

On a previous occasion I referred to steam jointing material such as Klingerite as a material which had been largely imported from Austria and Germany. Special efforts are now being put forth to make this in England. The difficulty, however, is the general lack of knowledge of the details of manufacture. I have seen two or three advertisements lately for foremen who know the details required, but I don't suppose it will prove easy to get them. Even if such advertisements penetrated to the Continent and caught the eye of some workman not "called up" the odds are that if he managed to land in England he would speedily find himself in an alien enemy detention camp. It seems difficult for the general business man to understand that the knowledge of how to make this, that or the other is not universal nor is it often to be acquired from text books. Many people seem to think that, given capital and better banking facilities, we can forthwith if we choose make for ourselves almost everything in manufactures that have hitherto been imported. They overlook the fact that many goods are made behind closed doors and that the details of manufacture are by no means common property. I don't know the exact position of the American works with regard to this article, but, of course, they have long been to the fore in steam packing material made otherwise than with sheet asbestos as a base.

With regard to the rubber toy branch, I have not heard of any active steps being taken by our rubber manufacturers, and it is noteworthy that the Hammond Toy Manufacturing Co., Limited, brought out in London in October, announces that at present it does not propose to make rubber toys.

THE WAR AND RECLAIMED RUBBER.

The fact that reclaimed rubber and scrap have been lumped with raw rubber on the conditional contraband list has naturally been a blow to reclaimers, as a good deal of business is usually done with Germany. Strong representations have been made to the customs and excise authorities with a view to the obtaining of licenses where the buyer in a neutral country guarantees that the reclaimed will not leave his works. The matter has been before the Privy Council, but the decision is adverse to the reclaimers. I know of a case where a consignment of scrap, or so-called scrap, to Rotterdam has led to the detention of the ship at a British port other than that she sailed from, and at the time of writing the situation is somewhat acute.

It does not seem to be generally known that there are several and by no means unimportant rubber factories in the Scandinavian countries, and there is nothing necessarily suspicious, therefore, about shipment of raw rubber and reclaimed to, say, Christiania, not many miles from which capital are situated the Norske Galoge Fabrik of Mjøndalen, near Drammen. It might be thought that reclaimers could make up their export losses by increased home business owing to large government contracts being given out; but here they are hit again, and badly, because the government specifications all put an embargo upon the use of reclaimed rubber. These are the old established specifications, and it is officially announced that they must be strictly adhered to even in this time of rush and stress. Moreover, with the present price of raw rubber there is little inducement for manufacturers to turn to reclaims of the higher sort, if they were disposed to take the risk of disregarding the regulations; and common qualities would almost certainly be detected. Other business where reclaimed rubber is often largely used is very quiet, both because of the loss of export trade and also on account of the depressed state of the cotton industry. The fact that recent specifications for insulated wire in Germany forbid the use of reclaimed rubber has also been announced.

SOME RECENT PATENTS.

In the October issue of THE INDIA RUBBER WORLD an interesting detailed notice is given of French patent No. 460,273 for reclaiming fabric impregnated with rubber. The subject is one which has received a good deal of attention in the past in England at the hands both of scrap dealers and reclaimers, more particularly with regard to waterproof fabric cuttings. No business success, however, can be recorded, and the destruction of the fabric is the universal procedure of reclaimers. One of the difficulties has been the labor involved in sorting the woolen from the cotton fabrics, as in the case of scrap the recovered cotton is valueless while wool scrap can always find a sale in the district of Yorkshire associated with the "shoddy" industry. The dealers, however, stipulate that the recovered fabric must be absolutely free from rubber, and though this appears to have been successfully achieved, the difficulty of obtaining sorted woolen scrap at a reasonable price led to the abandonment of the proposed enterprise. I notice that the French patent has special reference to the reclaiming of fabric such as vulcanizing cloths which contain but very little rubber. The rationale of the process is to soften and loosen the rubber by immersing the fabric for two or three days in xylol. With regard to the use of this solvent, the article mentioned above states that its price is over a dollar a gallon and that it is now unobtainable. This, however, is not the case in England, where tar distillation is carried on on such a large scale. Leaving pure xylol out of account, it may be said that for any rubber solvent purposes or-

dinary solvent naphtha—which consists mainly of xylol—will answer the purpose. The price of this varies from, say, 10d. (20.27 cents) to 1s. 4d. (32.43 cents) per gallon, its increased use for motor cars instead of petrol being offset by a large production from recovery coke-ovens.

NOTES AND MEMORANDA.

Now that the fortnightly rubber auctions in London have ceased, manufacturers are buying by private treaty from the rubber brokers. This system is preferred by the plantation interests in the Far East as they are freed from the necessity of arranging freight to England, this being seen to by the brokers who buy outright in the East. As to whether the new procedure will become permanent or exist for the period of hostilities only is a matter on which divergence of opinion is expressed.

GOVERNMENT PROOFING ORDERS.

The Manchester district—which may be called the headquarters of the trade—is busily employed, and some difficulty is being found in obtaining sufficient hands. Surprise has been expressed at some large orders—one worth £40,000—going past Manchester to Scotland, and it is evidence that the Scotch firms have made close bids for the business, one especially successful firm being that of Campbell Achnach & Co., of Glasgow.

TO WHAT BASE USES.

A detachment of Royal Engineers has been busily engaged at the Handforth works—which should have been turning out Pavea rubber by the ton at this date. A rumor gained currency that the stoppage of the works was due to inability to obtain certain chemicals from Germany. However that may be, 5,000 or more German prisoners of war are shortly due there, and the erstwhile neglected buildings have thus come into prominence and print for the second time this fateful year.

CHANGE OF NAME.

Changes of Teutonic to British names have been numerous since the war began, though there have not been many instances in the rubber trade. One such which may be mentioned is that of the managing director of the Premier Waterproof and Rubber Co., Limited, of Manchester (no connection with the Premier Reforming Co., of melancholy memory), Mr. Hugo William Hassberger being now known as Mr. Hugo William Hatton, which name should always be used in correspondence.

ANOTHER GIFT OF RUBBER FLOORING.

On October 16 the rubber flooring presented by the Rubber Growers' Association to the Children's Hospital, Great Ormond street, London, was "opened" or inaugurated by Lady Jellicoe on behalf of the association whose president, Mr. John McEwan, made an interesting speech. The flooring which is of pleasing design was the work of the India Rubber, Gutta Percha & Telegraph Works Co., of Silvertown, London, and was made, it need hardly be said, of plantation rubber.

THE LATE JOSEPH FRASER.

The late Joseph Fraser's death in Scotland recalled the fact that he was one of the leading Ceylon planters, being regarded as one of the most practical authorities on tropical products. He was frequently consulted by plantation companies.

Mr. Fraser was one of the most scientific of planters, having worked his way to the top without the influence of friends, the feeling being that no one had better deserved his success. He was a director of the Grand Central Estates and other Ceylon companies.

Death has been busy among the Ceylon planters in 1914. Besides Mr. Fraser, the obituary roll includes Melville White and John Pettu.

ADDRESS TO SIR HENRY BLAKE.

An address has been presented to Sir Henry Blake by the Rubber Growers' Association, recalling his services as president of the London International Rubber Exhibitions of 1908, 1911 and 1914, as well as in the capacity of president of the London Committee of the New York Rubber Exhibition of 1912. His endeavors to make known the details of tropical agriculture are likewise referred to with appreciation, while his services thus indicated are mentioned as the continuation of his work as governor in five great colonies.

EXPORTS OF RUBBER MANUFACTURES FROM MANCHESTER TO THE UNITED STATES.

A report from the American Consulate at Manchester, England, contains a table showing the exports from that district to the United States, including the Philippines, during the months of October, 1913 and 1914. From this table the following figures relating to rubber are obtained:

	1913.	1914.
Balata and other belting.....	\$796.53	\$28.30
Elastic web, cord, etc.....	382.31	50.22
India rubber sheets, pouches, etc.	1,219.50	3,298.69
Waterproof garments and cloth.	5,793.28	5,810.71

RUBBER COURSES AT THE MANCHESTER SCHOOL OF TECHNOLOGY.

Under the auspices of the Manchester education committee two laboratories were installed some years ago at the Manchester School of Technology, one for analytical work and the other for experiments in rubber manufacturing and for industrial investigations. The equipment includes a mixing mill and three-roll calender, a jacketed vulcanizing pan and a double platen, steam-heated vulcanizing press.

A course of 20 lectures on the production of rubber and the manufacture of rubber goods is scheduled for this season's course, which opened September 22.

RUBBER INSTRUCTION IN LONDON COLLEGES.

Two important rubber courses are in progress in London this fall and winter. One is a series of 12 lectures at the City of London College by Mr. Fred. Kaye on a group of subjects connected with rubber, including its commercial classification, plantation rubber, vulcanization, waterproofing and the manufacture of soft and hard rubber goods.

Last session of the rubber course at the Northern Polytechnic Institute, Holloway N., was attended by 38 students who competed for the prizes given, aggregating £15. For the coming session prizes amounting to £25 have been donated by Mr. Noel Trotter and Mr. Arthur Lampard.

GOLD MEDAL FROM THE RUBBER GROWERS' ASSOCIATION.

Mr. H. N. Ridley, C. M. G., late Director of Gardens and Forests, Straits Settlements, has received an honorary gold medal from the Rubber Growers' Association, London.

DEATH OF A PROMINENT RUBBER DIRECTOR.

After three months' illness Mr. Keith Fraser Arbuthnot died recently at Billingham, Sussex, England. He was one of the most prominent figures in the rubber share world. He was born in 1864. After being educated at Rugby he became a Mincing Lane tea broker, and was later on largely interested in rubber plantation companies, of many of which he became a director. In 1910 the Rubber Share Trust & Finance Co. then organized with a capital of £350,000, took over a number of his holdings. He was recently chairman of the Anglo-French Mercantile & Finance Corporation and of the United Sumatra Rubber Estates, Limited.

Trans-Atlantic Notes.

[*Situation in Plantation Rubber; the War's Rubber Requirements; Views on Overproduction*]

SINCE the war broke out the London rubber market has, if anything, undergone a change for the better, so far as the plantation article is concerned. At the end of July smoked sheet was quoted at 2s. 2½d. [53.7 cents] per pound; at the time of writing it stands at 2s. 5½d. [59.8 cents]. On the other hand, fine hard Pará has fallen from 2s. 10¾d. [70.4 cents] to 2s. 6½d. [61.8 cents]. Latterly a fairly substantial rise has taken place in the price of plantation rubber, due mainly to the sinking of the steamer "Troilus," with some 1,200 tons of rubber aboard, by the German cruiser "Emden," since destroyed.

As regards the actual consumption of rubber, at the present time one can only point to the firmness of prices and infer that the demand is keeping fully abreast of the supply. This is the more remarkable because, for the time being, the Continental demand is almost a dead letter. The Antwerp market was, of course, suspended long since and the business transferred to London. Importers have thus to depend almost entirely upon the British and American demand, and so far, this has been sufficient to preserve the balance. Many English manufacturers are now busy with Government contracts of a size hitherto unheard of, and it is expected that this activity will be maintained as long as the war lasts. Much trade also is being secured that would, in the ordinary course of events, have gone to Germany and Austro-Hungary; and there seems no reason to doubt that this trade will be retained here after the war. All this notwithstanding, it is an open question whether the special requirements of the armies in the field will counterbalance the falling off in other directions. So far, market evidence gives answer in the affirmative.

POSSIBILITY OF SURPLUS.

The question of providing against a surplus of plantation rubber has been revived and the proposal is made that producers should set aside a percentage of their crops to subsidise rubber roadways and the development of new uses for the product in general. The fear is certainly entertained in some quarters that unless some such scheme be adopted a big surplus of rubber may accumulate within the ensuing twelve months.

The general situation in rubber was ably reviewed the other day by Mr. A. A. Baumann in the course of a speech at the annual meeting of the Rubber Share Trust & Finance Co., of which he is chairman. He spoke in part as follows:

"With regard to the prospects of the rubber industry on which our revenue depends, we may consider it from two points of view. There is first of all the ultimate prospects of prosperity and there is the present, or immediate future, of the industry to be considered. Of the ultimate prospects of solid success for the rubber industry I think no reasonable man can entertain a doubt. What are the two essential factors of a commercial success? They are the production of a basic commodity, and at such a cost as will leave a substantial profit. Both these essential factors are present in the rubber industry. Rubber, if not a basic commodity in the sense that sugar and wheat are, is, at all events, as necessary to modern civilization as copper, and I think that if you cannot call it a basic commodity today it certainly will become one in the immediate future.

"With regard to cost of production there can be no doubt that the good rubber companies—those which are not over-capitalized and which are well administered—will, when they are in full bearing, reduce their all-in-costs to something like 9d. per pound at least. It would, therefore, seem a mere arithmetical sum to infer that when our total area is in bearing our all-in-costs will be reduced to something like 9d. per pound, and with that cost I have no hesitation in saying that there is a very substantial

margin of profit for the shareholders and for the owners of shares in rubber companies.

"With regard to the immediate future of the industry, I am bound to say that the adverse factors seem to predominate for the moment over the favorable ones, but I see no reason why we should be unduly pessimistic. The adverse factors are, of course, found in the increase of production accompanied by a diminution in certain quarters of consumption owing to the war. The estimated output from the plantations for the current year is 65,000 tons of rubber. Although I do not think that estimate will be realized, the probability is the amount will not be very far short of that figure. The estimated output of the plantations for the year 1915 is 85,000 tons, which I do not believe for a moment will be realized—for various reasons. But if you put the output of the plantations for 1915 at 85,000 tons it means an increase on the present production of 20,000 tons.

GERMAN REQUIREMENTS.

"Now, Germany is in the habit, or has been for the last two years, of consuming some 20,000 tons of rubber, of which about 10,000 tons have come from the plantations in the East. Well, I need hardly point out to you that you cannot increase your output by 20,000 tons and decrease your demand by 10,000 tons without having an adverse effect upon the market for the commodity. Against this may be set off one factor, and that is the increased consumption for war purposes by the Allies. There is no doubt that this war is very largely a motor war, and we can confidently anticipate a largely increased demand for rubber by Great Britain, France, Russia and the United States. But despite the difficulties of trading with Russia, there is already noticeable an increased demand by that country for rubber, which is not surprising, because the Russian soldiers are equipped with rubber boots, as ours ought to be, and there is, of course, very great wear and tear on tires. I am told that our manufacturers are working double shifts in making rubber sheets for our soldiers. So much for the increased consumption for war purposes.

"Secondly, we may look for diminished supplies of rubber, particularly from Brazil. Now, I have got some figures on that point which are really rather remarkable as showing the decrease of imports into this country during the nine months ended September 30. I find that to September 30 there were imported into Great Britain from all countries 49,442 tons of rubber as compared with 52,268 tons of rubber in the same period in 1913. The re-exports on the other hand from this country were larger in 1914 than they were in 1913. The re-exports from this country during the first nine months of the current year were 37,308 tons, as compared with 32,942 tons in 1913; leaving—and this is the important point—a net quantity for home use of 12,134 tons, as compared with 19,326 tons in the previous year, 1913—which, I think, is a very remarkable figure. Another consoling fact is that our re-exports to France and the United States for the current year are in excess of those which we sent them in the year 1913. In 1914 we re-exported to France 4,388 tons, as against 3,541 tons in the previous year, and to the United States of America we re-exported 17,257 tons as compared with 12,797 tons in the year 1913; so that we have to set off against what I call the unfavorable factors, the war and so on, the undoubtedly favorable fact that supplies from Brazil and from Africa are diminishing and that our re-exports to the United States, to France, and to Russia are increasing. But still I think you will find in the steady prices in the market that that fact is reflected"

FINANCIAL TALK

The financial situation of the rubber industry in the United States is generally regarded as being in a state of depression. The demand for rubber has been falling steadily since the beginning of the year, and the price of rubber has been falling correspondingly. The rubber industry in the United States is a highly competitive industry, and the falling price of rubber has had a serious effect on the industry. The rubber industry in the United States is a highly competitive industry, and the falling price of rubber has had a serious effect on the industry. SOME RUBBER INTERESTS IN EUROPE.

RUBBER IMPORTS AT BORDEAUX.

IMPORTS of rubber at Bordeaux for 1913 represented 2,543 tons against 3,484 tons in 1912.

The reduction in quantity was due to the fall in prices, which dropped during the period from March to September, many importers ceasing their operations at sources of supply. Business in Guinea and Ivory Coast rubber only recommenced towards the close of the year, when the natives were willing to sell in small lots. Imports of balata in 1913 showed a marked increase over the quantities of 1912, but prices were unsatisfactory owing to the irregularity of quality.

THE B. F. GOODRICH CO. IN FRANCE.

The French factory of The B. F. Goodrich Co., at Colombes, is now being operated under the direction of the Government of France, and its entire output of tires is being used on Government automobiles.

A GERMAN RUBBER FACTORY IN FRANCE CLOSED.

The plant of the Continental Société Anonyme, at 146 Avenue Malakoff, Paris, has been closed by order of the French Government. This company is a branch of the Continental Caoutchouc & Gutta Percha Compagnie, with headquarters in Hanover, Germany, and its factory has been looked upon with suspicion for the past two years by some of the leading French concerns, who claimed that it was being used as a base of operation for an extensive spy system particularly interested in military and aeronautic operations. On the outbreak of the war all the German members of the firm went back home, the only French member, Maurice Echalié, being left to conduct the operation of the plant. Its entire output and stock have been requisitioned by the government.

RUSSIAN GOVERNMENT IN THE MARKET FOR AEROPLANES.

Robert Pluym, who visited New York early in November, registering from Petrograd, is said to have announced his purpose in visiting this country to be the purchase of automobiles and aeroplanes for the Russian Government.

AMSTERDAM RUBBER IMPORTS.

While in 1907 the receipts of plantation rubber at Amsterdam only amounted to a nominal quantity, the total for 1913 rose to 1,039 tons, composed of the following sorts: *Hevea*, 839 tons; *Ficus*, 151 tons; miscellaneous varieties, 49 tons. This result is attributed by the British Consul to the increasing production of Dutch Indian estates, as well as to the favorable prices realized under the system of inscription sales at Amsterdam.

DENMARK'S RUBBER AND CABLE INDUSTRIES IN WAR TIMES.

In reply to a circular inquiry from the Danish Industrial Council, the Scandinavian Rubber Co. of Odense reported in September that rubber had been ordered from England and it was hoped to get it through by one of the Danish steam lines. Other raw materials were in stock to the extent of six months' requirements. Sales of rubber manufactures were difficult and large orders were not looked for.

The Northern Cable & Wire Works, of Copenhagen, stated that it was at present well provided with work. At the outbreak of the war it had large cable orders on hand, which were increased by the further contracts taken in consequence of the military preparations and the lack of communication with foreign sources of supply.

ITALY'S RUBBER IMPORTS.

According to a consular report on Italian imports of crude rubber and gutta percha presented \$9,000,000 in 1912 and \$9,364,448 in 1913. The proportion from the United States equaled: 1912, \$28,126; 1913, \$172,349. The volume imported for five months ending May was as follows: 1912, 1943 tons; 1913, 1365 tons; 1914, 2,276 tons.

THE GENERAL SITUATION IN GERMANY.

LETTERS received in this country from Germany show that the German rubber industry has stood the shock of war fairly well, but is far from good except in certain lines. The great demand for tires has favorably affected the turn-out of tire works, and many of them have actually now more work on hand than would be the case under normal conditions. The German war office, when war seemed inevitable, made arrangements with some of the leading firms to supply all tires in stock and to accept large orders for immediate delivery. The tire manufacturers holding stocks of tires in Germany have been compelled to hand these over to the government.

The fertile mind of the German rubber manufacturer apparently has accommodated itself quickly, with that adaptation which is one of the main reasons for the enormous development of German exports during the last years, to the conditions created by the war and soon the trade press began to carry advertisements of supplies of war material. A great demand for surgical instruments and rubber sheets has arisen, and will most likely continue until cessation of hostilities. Germany has been in the habit of buying large quantities of surgical instruments from England, and even American houses have been able to send such goods to Germany. The large demand which has sprung up during the last months must now be covered by home production entirely, which puts considerable pressure on the rubber manufacturers, especially as they have to solve the problem of larger production with a reduced number of workmen.

Germany has bought large quantities of rubber goods every year from England, the United States, Belgium, France and Italy. Even taken in consideration that the demand which has increased in some departments has fallen off in others, it is clear that a large part of those goods which came formerly from the countries now at war with Germany will either have to be supplied by friendly countries or must be manufactured in Germany. The last eventuality alone seems to have been sufficient to balance the loss in the home trade.

Nevertheless, there has been an enormous falling off in manufacturing activity, as practically the whole of the export trade has come to a standstill. The inability of Germany to hold the sea has made it impossible or at least difficult to carry on direct trade with neutral countries. In addition to that Germany misses the support of the London market in the business which formerly has been arranged by London merchants for German account or has been supplied by Germany filling orders for London shippers. German manufacturers are of the opinion that most of this trade will come back after the war, as it will be difficult for other countries, with the exception possibly of the United States, to replace those goods.

Nearly all the leading firms are keeping their works going, but in a few cases it has been necessary to shut down some of the departments.

A NEW GERMAN SEAMLESS DRESS SHIELD.

A sample has been registered by Ferdinand Henke, of Hanover, of a system for making seamless dress shields by means of a flat dipper made of wood or glass, provided with a handle, the head of which is rounded off and the lower edge cut out. Any desired number of dippers can be fastened in a shaft and dipped in a fluid dipping solution. The solution adheres to the dipper when removed, being dried and subsequently vulcanized. The finished product is formed into a seamless dress shield. In this way it is claimed that a seamless dress shield in one piece is produced.

SAVING IN WEAR OF RUBBER HEELS.

A collection of small samples has been prepared by the Rubber Institute of the German Rubber Association. In these small pieces of material are arranged small metal sunk heads to prevent them falling out.

RUBBER SOLVENTS IN GERMANY DURING THE WAR.

IN addition to a shortage of rubber in Germany it appears that the question of solvents is also pressing. With characteristic thoroughness the German scientists are studying this lesser phase of the rubber problem and trying to find a solution.

One might think that with the import of crude rubber absolutely shut off this all important question would entirely occupy the German mind, but not so. The smallest detail is carefully worked out by the scientist in co-operation with the government or with the large firms.

It must be remembered that Germany produces practically no petroleum within her borders, that Austria-Hungary in the province of Galicia is a large producer, but that this province was overrun by the Russians, who have seemingly retreated from some parts; but it is safe to say that what they left was not of much value, and production will be crippled there for a long time. Rumania seems to be becoming also more unfriendly since the death of the ruler, so that the gasoline problem is increasingly more serious. This war is fought on gasoline as the motive power to a large extent.

Germany has an immense coal tar industry, but this consists in manufacturing the crude materials into high-priced articles like dyes and medicines. Germany has for years imported from England a large amount of crude coal tar products. Therefore the coal tar products will be substituted for gasoline for motors; but this is only a drop in the bucket compared with the gasoline requirements. As showing the recognition of this condition and the preparation for it it is said that the Committee on Provision of War Necessities which was appointed by the German Government to look out for the future needs started up the Belgian coke ovens at Liege within two days after the Germans took the town. This will furnish coal tar as a by product, which will in turn furnish the benzol and motor spirit.

Dr. Fr. Frank and Dr. E. Marckwald, of Berlin, have discussed this problem in the columns of "Gummi Zeitung" of recent date. Some of their remarks will be abstracted here, as they may supply useful hints for the American trade and will at least inform us of what is being done abroad.

Coal tar benzol mixed with gasoline has been extensively used in motors in France and Germany, as have also alcohol and benzol mixed and separate; but alcohol only furnishes about six-tenths the power per gallon that gasoline does. The German Government took possession of all stocks of benzol and gasoline on the outbreak of the war, so that all manufacturing of rubber articles requiring solution stopped. Plants with government contracts were allowed to use some solvents when necessary, but were obliged to exercise caution and not waste anything.

It is now thought that Germany and Austria may be able to supply some substitute products. With this in view an effort will be made to use those less volatile. It is believed that the Xylenes, which boil at about 140 deg. C., would be suitable solvents and might be supplied at a reasonable price. It is said that there is no hope of the rubber manufacturers getting any benzine, or what we call naphtha, except what is allowed to those who are working on government contracts.

Carbon tetra-chloride is discussed, but as it is remarkably heavy and the fumes and vapors are disagreeable, it is thus objectionable, and while it dissolves crude rubber satisfactorily yet in cold vulcanization it penetrates deeply and the product is usually too hard. Fusel oil is also thought of, but its supply is too limited. The terpinene is also mentioned with the statement that their boiling point is too high.

Carbon bi-sulphide is also recommended in spite of its odor

and poisonous character, and the danger of fire. It is said that industrial hygiene has progressed in Germany to such a point that this can now be used with safety. Mixing with carbon tetra-chloride is recommended so as to reduce danger of fire.

In a later article these same authors state that as the supply of benzine (or gasoline) has been found to be sufficient for use in the army, some benzol may be supplied to the rubber manufacturers, who will thus be enabled to continue operations. The objections to benzol and xylol have been overcome to a great extent by the rubber manufacturers though these are found to retain water much more than the naphthas.

A mixture of equal parts of carbon bi-sulphide and carbon tetra-chloride having a specific gravity of 1.4123 has been found to be the most suitable mixture of these two solvents, but fire risks are not entirely eliminated and the odors are quite disagreeable. Five per cent. alcohol added to this mixture is said to have remarkable influence on the solvent properties and the viscosity. Considerable quantities of rubber are said to dissolve in this mixed solvent in a few minutes, forming a clear and thin solution. Fear is expressed that the alcohol mixture may cause some trouble on account of the residue of water thus introduced into the rubber. The experiments were made with absolute alcohol. The latest information is that heavy benzine will be allowed to be used in technical work.

GROWTH OF GERMAN RUBBER IMPORTS.

Recent figures of the German Statistical Office show that the national population has grown from 62,900,000 in the middle of 1908, to 67,800,000 at the same period of 1914, being an increase of 4,900,000, or more than 7 per cent. This increase of population has been accompanied by a growth in the imports of raw materials, particularly rubber.

German rubber imports for the last 5 years were:

	Quantity	Value
1909	15,500 tons	\$33,700,000
1910	18,700	55,500,000
1911	20,000	42,387,500
1912	20,600	40,675,000
1913	20,500	24,800,000

Within the last 5 years the German imports of rubber have thus increased in quantity, while they show a falling off in value.

Exports from German East Africa, Camerun and Togo represented: 1909, 2,138.7 tons; 1910, 2,840.4 tons; 1911, 3,709.5 tons; 1912, 4,180.2 tons.

GERMANY'S CABLE EXPORTS.

According to English statistics, the total German exports of electrical machinery and apparatus for 1913 represented a weight of 133,855 tons and a value of \$69,000,000; of which land cables weighed 47,571 tons and had a value of \$9,550,000. The chief countries to which this quantity was exported were: Holland, 6,955 tons; Argentina, 6,835; Norway, 3,655; Japan, 3,724; Dutch Indies, 3,616; Sweden, 2,281, and British South Africa, 1,195—the exports to these countries representing about 70 per cent. of the total weight. In addition, there were 4,739 tons of submarine cable exported. German electrical exports had increased in 1913 about 50 per cent. since 1910.

SHOW CASE FOR RUBBER HEELS AND TIPS.

A German has recently taken out a patent in his country for a show case constructed to hold all the different sizes of rubber heels and tips made for the German trade. The purpose of the case is to make it possible for the salesman to find in a moment the exact size of heel or tip required.

THE RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

A STATISTICAL return lately issued by the Japanese government showed an increase both in quality and value of rubber imports for 1913 as compared with 1912. The following are the details with sources:

COMPARATIVE JAPANESE RUBBER IMPORTS OF 1912 AND 1913.

From—	1912—		1913—	
	Pounds.	Value.	Pounds.	Value.
British India	167,063	\$140,781	340,343	\$239,281
British Straits Settlements	1,214,485	820,891	1,657,265	885,602
Dutch Indies	124,904	73,171	13,928	8,908
Great Britain	242,620	230,663	440,802	408,865
Germany	25,600	19,307	15,425	10,425
United States	158,176	160,556	139,624	100,112
French India	3,805	3,874	4,464	3,032
Other countries	67,377	65,314	70,092	69,697

Total 2,004,030 \$1,514,557 2,681,943 \$1,725,922

Increase in 1913 about 33 per cent. in quantity, 14 per cent. in value.

The progress made by the Japanese rubber industry has been largely due to the manufacture of jinrikisha and bicycle tires, which had hitherto been generally imported. Among the companies which have gone ahead in this line are: the Kakuichi Rubber Co., of Osaka; the Yokohama Electric Wire Works, of Yokohama and Osaka; the Nipon Electric Wire & Cable Co., of Tokyo; the Sumitomo Electric Wire Works, of Osaka, and the Settsu Rubber Co., of Hyogo. The recently established companies include the Taisho Rubber Manufacturing Co. and the Naigai Rubber Co., both of Kobe.

Owing to the development of the industry at Kobe and Osaka the total imports of crude rubber at these points now surpass those of Yokohama, as shown by the following table:

APPROXIMATE RECEIPTS OF RUBBER AT PRINCIPAL JAPANESE PORTS.

	1912—		1913—	
	Pounds.	Value.	Pounds.	Value.
Yokohama	1,023,052	\$826,580	1,228,710	\$851,814
Kobe	970,897	676,850	1,438,893	862,483
Osaka	10,081	11,127	14,037	11,319
Nagasaki			303	306

Total 2,004,030 \$1,514,557 2,681,943 \$1,725,922

Eighty per cent. of the 1913 crude rubber imports from Singapore consisted of plantation. While the fall in prices caused an augmented import in 1913, many crude rubber importers are said to have lost heavily. The imports of hard fine Para were reduced owing to competition of plantation rubber. In consequence the receipts from the United States declined. Imports of African rubber fell off in 1912 and were altogether lacking in 1913, on account of the fall in plantation prices. Generally speaking the imports of crude rubber were in 1913 well taken up by consumers at the following prices:

FLUCTUATIONS OF RUBBER IN JAPAN, 1913.

Variety—	Jan.-Feb.	Sept.	Oct.-Nov.
Borneo	yen 1.60 (80c.)	yen 1.25 (63c.)	yen 1.35 (68c.)
Indian	yen 1.60 (80c.)	yen 1.20 (60c.)	yen 1.00 (50c.)
Plantation sheet	yen 2.25 (\$1.13)	yen .95 (48c.)	yen 1.20 (60c.)
Pará	yen 2.50 (\$1.25)	yen 1.80 (90c.)	yen 1.70 (85c.)

BICYCLE IMPORTS, 1913.

Japanese imports of bicycles and parts in 1913 amounted to \$1,586,492, as compared with \$1,558,118 in 1912, the net increase being \$28,374.

Japanese exports during 1913 included insulated electric wire \$47,060 (principally for China) and jinrikishas and parts \$358,141. The largest exports of the latter were to the British Straits Settlements. Exports of complete carriages fell off in consequence of business depression in Singapore and British India, while in Hong Kong and Annam many manufacturers are constructing jinrikishas from imported parts.

DISSOLUTION OF TOHAN RUBBER CO.

Having accomplished its purpose, the Tohan Rubber Co., formed in February, 1914, was dissolved on August 31. It was composed of five medical rubber tubing manufacturers and nineteen dealers, with the object of bringing up the prices of the article by clearing off the makers' stocks.

JAPANESE RUBBER IMPORTS AND EXPORTS.

THE report of United States Deputy Consul General J. W. Ballantine, of Yokohama, on Japanese foreign trade gives the total Japanese imports for 1912 and 1913 as \$308,258,154 and \$363,256,960, and the total Japanese exports for these two years \$262,436,957 and \$314,965,186. The Japanese imports for the two years from the United States amounted to \$63,253,847 and \$60,959,364, and the exports to the United States to \$84,017,030 and \$91,868,612.

The part of the report devoted to Japanese rubber imports and exports is particularly interesting. The chief imports of rubber manufactured goods into that country for 1912 and 1913 are shown in the table below:

CHIEF RUBBER IMPORTS INTO JAPAN.

Insulated electric wire:			
From	1912.	1913.	
United States	\$129,912	\$47,836	
Germany	1,237,458	706,495	
Great Britain	1,305,778	244,638	
Other countries	10,265	2,567	
	\$2,683,413	\$1,001,536	
Tires chiefly for bicycles:			
From	1912.	1913.	
United States	\$22,609	\$8,835	
Great Britain	526,111	492,387	
Germany	4,100	15,774	
Other countries	1,630	277	
	\$554,450	\$517,273	

Imports from United States included:	1912.	1913.
Crude rubber and gutta percha	\$159,914	\$90,712
Rubber boots and shoes	41,285	41,845
Manufactures not otherwise specified	284,464	241,152

The aggregate Japanese imports of india rubber and gutta percha were: 1912, \$1,508,502; 1913, \$1,719,019. Of this total the United States furnished: 1912, \$159,914; 1913, \$90,712. Every year shows an increase in the Japanese imports of rubber, about one-half of which comes from the British Straits Settlements.

Among the exports sulphur amounted in 1912 to \$869,147; in 1913 to \$986,456. Of this aggregate the United States received: 1912, \$443,603; 1913, \$358,457.

Japanese imports and exports, it will be noticed, both showed for 1913 an increase of about 20 per cent. above 1912. Trade with the United States alone, on the other hand, displayed a reduction in imports of 5 per cent. and an advance in exports of 8 per cent.

YOKOHAMA RUBBER IMPORTS.

A consular report for the years 1912 and 1913 shows the following imports of rubber at Yokohama.

	Tons.	Value.
1912	532	\$823,274
1913	614	848,407

It will interest American manufacturers to know that the Japanese government proposes to lay a cable between Nagasaki and Shanghai.

The permanent market committee of the Rubber Growers' Association has discontinued the recording of plantation rubber weights in hundredweights, quarters and pounds, having substituted pounds for the other denominations.

PLANTATION RUBBER INDUSTRY AND THE WAR.

ACCORDING to a communication from M. N. Le Coispellier to the "Annals of Indo-China Rubber Planters," the rubber trade, in common with business in general, was surprised at the sudden breaking out of the war in the closing days of July last, when sales ceased in the East. Penang and Singapore held their last auctions previous to the war on July 28. They showed a lack of activity under the influence of the European cables, which left but small hope of maintaining peace. Sales were resumed rather timidly on August 12. The last sale before the war was held at Ceylon on July 31, when the situation was such that the principal sellers withdrew their offerings, some private sales being afterwards made at prices equaling between 48 and 49 cents (American currency) per pound.

On the suspension of sales the planters of the Malay Peninsula lost no time in devising plans for meeting the situation. Messrs. Skinner and Macfadyen, former and present presidents of the Planters' Association of Malaya, went to Singapore to call the attention of the government to the prospective effect of the altered conditions on the plantation industry. A general meeting of the association was also held August 6, at Kuala Lumpur, to discuss the steps to be taken.

After an ineffectual attempt to obtain the co-operation of financial institutions, an arrangement was made by which both in the Federated Malay States and in the colony of the Straits Settlements the respective governments would make cash advances to the estate owners for the purpose of at least feeding the laborers, while official intervention would be used to persuade the latter that it was in their interest to remain on the plantations on the terms which would be offered them.

To cover these advances the government would receive consignments of first quality rubber, on which advances would be made at a rate equaling about 18 cents American currency per pound, or listed securities. In certain special cases loans would be made on personal guarantees. The requirements of the Federated Malay States for making these advances in money or rice were met by the help of the Straits Settlement colony, which took over shares from the Federated Malay States, which it would have been difficult to sell in present conditions, but which the colony was in a position to handle, having acquired a considerable stock of gold.

The principal anxiety of the planters was lest they would be unable to retain their coolies (estimated at 270,000), hence addresses were delivered in the various districts urging the laborers to accept the temporary conditions offered them for keeping the estates in good shape and doing a small amount of tapping.

According to M. Le Coispellier's statement, a large number of estates on the east of Sumatra belonging to English and German planters decided to cease operations, leaving to their own resources their 30,000 to 40,000 coolies, who were obliged to return to Java.

The efforts made on the Malay Peninsula to open up new outlets for rubber, in order to replace those closed in Europe, are spoken of as being all the more opportune, as there is a certain slackening of the English rubber industry and almost a total cessation in France, Belgium, Russia, Austria and Germany.

It is added that the horizon is becoming clearer for the rubber industry in general, and particularly for producers, the maritime commercial routes remaining free, which enables the raw material to be brought in security to the markets. The unprecedented assumption of rubber for the pneumatic tires of automobiles for military purposes will alone form an important outlet. This situation, the planters believe, cannot fail to react on the price of the raw material, all the more as, owing to the uncertainties of the opening of the campaign, a slackening of production took place which may lead to a scarcity of product. The hope is expressed that the reaction will not be sufficient to

bring back low class wild rubbers to consumption. Had plantation rubber not continued to reach the markets, manufacturers would have tried to promote the cultivation of lower grades in Brazil.

Regarding the Indo-China plantations M. Le Coispellier remarks:

"The question of labor not having to be met at present, our policy should be to continue as we have begun, so as to be ready to benefit by the increase of price which will certainly take place in Europe after the war, when the rubber industry there will be revived—pacified for a long time to come.

H. F. MACMILLAN, F. L. S.

"THE most beautiful gardens in the world" is the way a great many tourists describe the Royal Botanic Gardens at Peradeniya, Ceylon. However that may be, these gardens are certainly, from the rubber standpoint, the most interesting and important anywhere in the tropics. They have achieved this distinction through the intelligent work of the long line of well trained and conscientious scientists who since the Gardens were first started, in 1821, have devoted their lives to the success of agriculture and horticulture in the British tropical colonies.

On the retirement of Mr. J. C. Willis in December, 1911, H. F. Macmillan, F. L. S., was appointed superintendent of these Gardens. He received his early training at the Royal Botanic Gardens, Kew, London, and at the Royal College of Science, South Kensington, London.

The Secretary of State for the Colonies made him Curator of the Royal Botanic Gardens at Peradeniya in 1895. He began at once to develop new features, transforming a portion of the grounds into an extensive floricultural section, now easily the most popular and attractive feature of the Gardens.

He is well known as the author of numerous pamphlets and bulletins on botanical, horticultural and agricultural subjects, including "Notes on Ceylon Botany," "Illustrated Guide to the Royal Botanic Gardens, Peradeniya" (an elaborate publication now in its second edition) and the familiar "Handbook of Tropical Gardening and Planting." The first edition of the latter, of which the Government of Ceylon purchased a large number of copies, was sold out within ten months of its publication. A second and much enlarged edition containing some 300 illustrations (mostly from photographs taken by the author) is now out of the press. Another work recently completed is an illustrated bulletin on "The Use of Explosives in Agriculture," while he has in hand the preparation of a "Classified Catalog of the Collection at the Royal Botanic Gardens, Peradeniya."

Mr. Macmillan was secretary of the All-Ceylon Exhibition of 1912, the largest exhibition ever held in Ceylon, and in recognition of his services in this capacity he was presented with a special gold medal. He was promoted to the office of Chief of

H. F. MACMILLAN.

Division of Botanic Gardens in Ceylon on the resignation of Dr. Lock, under the new Department of Agriculture so ably presided over by Mr. Lyne.

With little time for hobbies, he has managed to specialize to some extent in photography, and possesses doubtless the largest collection of photographs of botanic and agri-horticultural subjects in Ceylon. He has won many medals, cups, etc., for photography at exhibitions, the latest being a first prize of £25 offered by the "India Rubber Journal" at the London Rubber Exhibition for a series of photographs showing the production of plantation rubber from seed to shipment.

He devised, in the early days of rubber planting, a method of transporting rubber plants and seeds over long journeys, for which a gold medal was awarded at the first rubber exhibition

held in Ceylon, in 1906. As a result of this, rubber plants were successfully distributed from Ceylon to practically all parts of the tropical world, including even Brazil and other parts of tropical America. He was closely identified with the introduction of different kinds of rubber into Ceylon in the early days of rubber and with the spread of information regarding their cultivation and prospective merits.

While Mr. Macmillan has devoted himself to tropical botany for so many years, he still finds time for an occasional game of golf, and, as a matter of fact, he laid out, on a very rugged and apparently unpromising piece of land, the popular and picturesque links of the Kandy Golf Club, of which he has been made not only Honorary Ground Secretary, in recognition of his services, but an honorary life member.

Some Rubber Planting Notes.

CEYLON CHAMBER OF COMMERCE REPORT.

THE report of the Ceylon Chamber of Commerce for the half year ending June 30, 1914, showed the exports of rubber for the first six months of the last three years to have been as follows: 1912, 5,697,133 pounds; 1913, 10,498,434 pounds; 1914, 17,368,591 pounds.

Attention is called to the fact that Ceylon rubber exports continue practically to double each year.

Regarding distribution, it is remarked that the local Colombo market is capable of dealing with much larger supplies than have hitherto been available, enjoying, as it does, special facilities for direct shipment to all the principal rubber markets in the world. It is added that it is a matter of conjecture, whether rubber produced in other Eastern countries will be consigned to Colombo for sale, but it is considered that Ceylon grown rubber can undoubtedly be dealt with to advantage locally.

There is room for improvement in the matter of grading and packing, especially on the former point. Good parcels are frequently diminished in value by a small proportion of "rocky" pieces, a defect which might easily be overcome by additional factory supervision. The adoption is recommended of some generally accepted uniform method of sorting, thus arriving at standardization. In this way operations with the consuming markets would be facilitated; the reasonable requirements of manufacturers being met by eliminating a number of the sorts and varieties at present brought to market.

Mr. William Moir, the chairman, was re-elected for another year.

CEYLON RUBBER EXPORTS.

According to the report of the German Imperial Consulate at Colombo, the year 1913 was a critical period for the rubber industry of Ceylon. The price at the beginning of the year equaled \$1.06 United States currency per pound, and fell in September to the equivalent of 48 cents per pound. The quantity exported in 1913—about 28 million pounds—was distributed as follows: To Great Britain, 15,238,000 pounds; United States, 6,572,000 pounds; Belgium, 4,124,000 pounds; Germany, 431,449 pounds; other countries (about) 1,634,551 pounds.

THE AGAR SMOKING APPARATUS.

C. Alma Baker, of Perak, one of the largest planters of the Federated Malay States, lately visited R. S. Agar's Ceylon estate to see the operation of the Agar smoking machine. Mr. Baker was of the opinion that the Agar machine, with slight alterations, would prove exceedingly valuable to the planting industry. Its absolute simplicity constitutes its chief merit. The rubber is coagulated in a receptacle, through which there passes a large cylinder which carries the smoke through the latex, the latter being either completely coagulated into lump or drawn off before complete coagulation, put into pans and made into the standard required for the market. The machine takes 125 gallons of latex

at a charge, which requires from 20 to 30 minutes to coagulate, giving in a 10-hour day 3,000 pounds of dry rubber or 6,000 pounds with one smoking chamber for two machines.

The rubber produced by the Agar process is said to be very clear. No acetic acid is required, it being claimed that for this reason the rubber contains much more of the essential qualities than when obtained by the use of acid.

RUBBER CULTIVATION IN INDIA.

Rubber production in India is confined to Assam, Burma and the Madras Presidency. Statistics for the fiscal years ending March 31, 1913 and 1914, are as follows:

	1913.	1914.
Assam	52 tons	24
Madras	444	798
Burma	235	341
Total	731	1,163

While Burma heads the list in acreage and number of trees planted, most of these trees, being less than six years old, are at present unproductive. Burma has 29,544 acres under rubber with 4,911,399 trees; while Madras has 12,022 acres, with 1,636,476 trees, and Assam, 4,681 acres, with 137,430 trees. The rubber production of Madras is thus at present more than double that of Burma.

JOHORE'S PROGRESS.

According to an official report on Johore for 1913, the revenue equaled in United States currency \$2,451,991, with an expenditure equalling \$2,435,239. The imports represented \$5,240,525 and the exports \$7,959,196.

The principal events which marked the progress of 1913 in Johore were the fall in rubber prices and the consequent readjustment of payment for labor. Owing to the former cause, the opening up of new lands for rubber cultivation by European companies nearly ceased, while the Japanese during the year added 11,000 acres to their existing cultivated areas. Many European estates were thus able to discharge a number of coolies, this large available supply of labor resulting in a reduction in the scale of wages.

The export returns of other agricultural produce displayed no marked variation as compared with previous years, rubber forming a notable exception, the production having risen from 22,000 pikuls (2,933,333 pounds) in 1912 to 46,000 pikuls (6,133,333 pounds) in 1913, an advance of about 109 per cent. It is thought that this rate of increase may possibly be maintained during the next few years, as the large areas planted in 1911 and 1912 reach maturity, but with the spread of more rational ideas as to the conservation of bark a reduction in output would naturally result. Areca nut plantations have been in some instances cut down to make room for rubber.

HALF SALARIES TO EUROPEAN ESTATE MANAGERS.

At a recent meeting of the Planters' Association of Malaya, a proposal was made for reducing the salaries of European managers and assistants. It is reported that in some cases Europeans were placed on half salaries, but the hope has been expressed that when estates revert to full payment of coolies wages the remuneration of the officials will follow suit. The establishment of a system of retail cash trading was likewise advocated, as possibly leading to an appreciable reduction of living expenses. In fact, the continuance of the cash arrangements now in force is recommended, in place of the previous credit system.

GERMAN EAST AFRICAN PLANTATIONS.

During 1913 the rubber plantations of the Amani Biological Station were considerably developed. *Manihot* seeds were produced in greater quantity than was found needful, the demand having slackened. A great number of the older trees were broken by the wind. *Hevea* was well developed, seeds and plants being abundantly distributed. A certain number of old trees was lost through the ravages of parasites on their roots. *Ficus elastica* prospered, particularly the Sumatra variety with small leaves. The older plantings of *Castilloa* have been given up, as they were found to produce an inferior latex, but the seeds imported from Saigon and Costa Rica have produced other trees which can soon be tapped. A large number of vines has been planted in the gardens of the Amani institute. Cultivated gutta percha has yielded relatively good results, but the flowering has in some cases been slow.

DUTCH INDIAN RUBBER PRODUCTION.

A British consular report gives the following details of the exports of the different varieties of rubber from Java within the last two years:

	1912.	1913
<i>Hevea Brasiliensis</i>	485	2,339
<i>Ficus elastica</i>	475	124
<i>Castilloa</i>	23	43
Ceara	1/2	11
Other varieties	34	46

Total	1,017 1/2	2,563
-------------	-----------	-------

The falling off in exports of *Ficus* is attributed to the fact that many trees of this variety have been cut out by planters, who now pin their faith to *Hevea*. Statistics issued by the Java department of agriculture showed that in January, 1913, there were 220,578 acres under rubber in Java, of which 187,535 were in *Hevea*.

RUBBER EXPORTS FROM SUMATRA.

Rubber exports from the east coast of Sumatra have largely increased during the last four years, having been: 1910, 539 tons; 1911, 813 tons; 1912, 1,807 tons; 1913 (estimated) 3,020 tons. Of the 230,075 acres under rubber in 1913, 220,005 were in *Hevea*.

Owing to the low price of rubber in 1913, the extension of planting was checked in Sumatra, the tapping of new areas being postponed and close attention directed to reducing costs of production. Many of the older producing estates seem to have reduced their cost at point of shipment to 8d. (16.21 cents) per pound while in some cases a further slight reduction is anticipated on this figure when the trees are in full bearing.

EXPORTATION OF ADULTERATED RUBBER FROM BELGIAN CONGO PROHIBITED.

A Belgian Royal Decree prohibits the exportation of adulterated and impure rubber from the Belgian Congo, rubber of the prohibited character being subject to confiscation. All rubber presented for exportation must be accompanied by a certificate of purity.

OPENING OF THE BATAVIA EXHIBITION.

THE "Indische Mercur" of October 23 contained a Reuter's cable from Batavia to the effect that the Governor General had just opened the International Rubber Exhibition. It was added that almost all nations were represented.

A number of papers were to be read at the exhibition, including the following:

"What Rubber Manufacturers Want in Crude Rubber," by H. C. Pearson, Editor of THE INDIA RUBBER WORLD.

"The Significance of Branching in Young *Hevea* Trees," by W. J. Gallagher.

"Planting Distances for *Hevea*," by C. M. Hamaker, Kiara Pajoeng, Java.

"Tapping and Tapping Systems," by F. G. Spring, Kuala Lumpur, F. M. S.

"The Planning of Manurial Experiments," by W. Barrowcliff, Asst. Agr. Chemist, Dept. of Agriculture, F. M. S.

"Catch Crops and Inter-crops," by R. W. Munro.

"Catch Crops with *Hevea*," by Dr. C. J. J. van Hall, Buitenzorg, Java.

"Diseases of *Hevea*," by Dr. C. J. J. van Hall and Dr. A. A. L. Rutgers, both of Buitenzorg, Java.

"Preparation of Rubber of Light Color," by Dr. A. J. Ultee, Djember, Java.

"Manuring of *Hevea*," by Dr. A. J. Ultee, Djember, Java.

MR. LAMPARD ON FORWARD SALES.

At the last meeting of the Sialang Rubber Estates, Mr. C. A. Lampard urged the advisability of forward contracts for crude rubber. One reason was the need of affording the manufacturer the opportunity of providing for his future requirements. Were this denied him, he would buy wild rubber, which is what plantation owners desire to prevent. Their policy was to get their rubber into all the world's factories, and this end could best be accomplished by selling ahead a portion of their output as they found a means of doing so.

SELECTION IN HEVEA.

In dealing with this subject, the "Tropical Agriculturist," of Colombo, remarks that as the rush of planting is over the selection of seed is a point calling for the careful attention of rubber companies.

The pre-eminence of Java in cinchona has been attributed to the selection of the highest yielding trees. At Peradeniya two acres have been planted in rubber with seed from the old Heneratgoda tree which yielded 386 pounds of dry rubber in 4½ years. When old enough to tap, the yields will be carefully recorded and any poor producers removed, selection being based on yield.

It has been proposed for estates to set aside one or two acres to be planted with seeds from the trees which have shown the best yields. Any trees which have proved below the standard would be cut out, so as not to risk deterioration in the succeeding generation.

SPOTTING OF RUBBER.

In a bulletin on the above subject, Mr. A. Sharples, Assistant Mycologist of the Department of Agriculture, Federated Malay States, remarks that the spottings and discolorations in plantation rubber are mostly due to common saprophytic fungi.

Rubber prepared from latex diluted with water shows a greater tendency towards spotting than that from undiluted latex. Any addition of coagulant above the minimum necessary also increases this spotting tendency.

BRAZIL'S NEW PRESIDENT INAUGURATED.

Dr. Wenceslau Braz Pereira Gomes was inaugurated President of Brazil on November 15, at Rio Janeiro. The ceremony, which took place in the Senate Chamber, was attended by members of Parliament, the diplomatic corps and many prominent citizens.

MIGUEL P. SHELLEY.

AMONG the interesting people who have recently come to New York is Mr. Miguel P. Shelley, who for the last 23 years has been associated with the crude rubber industry in Pará. His career in South America, both in the gathering and exportation of rubber and in other industries, has been varied and is most interesting. It is a good illustration of the influence of early reading upon one's future.

The books of adventure of Jules Verne and Captain Mayne Reid inspired him as a boy with the desire of seeing Brazil, and especially of visiting the Amazon Valley with its wild natural life. The opportunity for gratifying this desire arrived early in life, when as he was about to be admitted to a commercial college in

Berlin the advertisement of one Dr. Prado, a Brazilian, appeared in a local paper, for a young man who spoke English, German, French and Russian, to take charge of a colonizing party for a coffee plantation at São Paulo. He applied for and secured the position.

After a year's work on the plantation his services were no longer needed, because the laborers had learned to do the necessary work without the aid of an interpreter. During this time he

MIGUEL P. SHELLEY.

learned Portuguese, Spanish and a little Italian. His next employment was at São Paulo on the staff of the German newspaper "Neue Freie Presse," and later he became traveling sales man for the paper and its accessory printing establishment.

In 1891, when a revolution broke out in Brazil, he traveled north to Pará. There he was engaged by a general brokerage and auctioneering establishment, where he worked for 5 years. But knowing that the principal business of Pará was rubber, he determined to make this article the subject of special study. The chance came when Chavez Hermanos, the largest owners of rubber estates in Rio Madeira, requiring a general clerk for their different *seringals*, he obtained this position, learning there the rudiments of the rubber industry. For a few months, in order to learn the work practically, he worked as a laborer, starting with location of trees, or forming an *estrada*, tapping them and fuming the latex. Later he became manager of the business in Pará where they were established as *aviadores*, supplying mostly their own needs.

In 1899, during the financial crisis in Brazil, the firm had to close up its business at Pará. Mr. Shelley then came to the United States, commissioned by the mayor of Pará, Senador Lemos, to buy beef for the State so that it could establish an opposition to the meat merchants who had been raising the price abnormally. His undertaking being successful, after a few shipments the merchants lowered the price and he returned to Pará. There Senador Lemos needed a manager for his newly organized political paper "O Jornal" and Mr. Shelley was appointed to this position. The paper was such a success that it showed a fine profit after a year's business without financially depending on the party. During this time he studied law and was graduated by the "Instituto Civico Juridico Paes de Carvalho."

In 1909 he visited New York again and during his stay contributed several articles to THE INDIA RUBBER WORLD. The following year he returned to Pará and established a commercial paper for North Brazil to specially treat of rubber, "O Comercio Norte-Brazileiro." This paper gained wide popularity, because of the great space it gave to carefully tabulated statistics and to commerce and because it foretold a year and a half in advance the drop in price of rubber to one dollar from three. It also foretold that the production of rubber in Ceylon would be 75,000 tons for 1915, and the price 50 cents and prophesied the effect of this competition on the Brazilian trade.

After a year's hard work and fighting the paper had to be dropped because of Mr. Shelley's friendly connection with Senador Lemos and the political uprising against him. He was then called by the well-known rubber expert, J. A. Mendes, to co-operate with him in re-establishing the firm of J. Marques, which had been affected by cornering the 3,000 tons of rubber on account of the Banco do Brazil (known as the Syndicate J. Marques). The greatest part of the stock was sold at good prices and the firm of J. Marques, from one of small importance, became the second in the Amazon.

When Secretary of State Elihu Root visited Pará the report which Mr. Shelley published and telegraphed to the Brazilian newspapers on his interview, showing the friendly feelings which America wished to maintain with Brazil, resulted in his receiving a most hearty welcome at Rio de Janeiro.

BRAZILIAN IMPORTS OF ELECTRICAL CABLE.

Statistics recently issued by the Merchants' Association of New York give the amount of electrical cable imported into Brazil during 1913 as having a value of considerably over \$800,000. The countries from which these imports were made and the value of the electrical cable from each country are shown in the table below, from which it will be noticed that the United Kingdom sent Brazil two and a half times as much cable as the United States.

From	Electrical Cable
United States	\$162,317
United Kingdom	408,002
Germany	166,578
France
Other countries	85,973
Total	\$822,870

COMPARATIVE FIGURES ON EXPORTS FROM BRAZIL.

The following table shows the quantity of rubber exported from Brazil in August and September of the present year and in the same months of 1913.

	Pounds	Value
August, 1914	3,333,095	\$1,627,384
August, 1913	4,791,952	2,712,451
September, 1914	5,716,856	2,720,910
September, 1913	4,899,600	2,762,462

COTTON PLANTING IN SOUTH AMERICA.

A new company under the name of the Dutch West Indies Cotton Growing Co. has been established in Holland for the object of raising cotton on the island of St. Eustatius, Dutch Windward Islands.

Previous to the declaration of war, a company (styled "La Oriental") was formed in Brussels for the establishment in the Department of the Rio Negro, Uruguay, of a cotton planting colony, in connection with a thread and textile factory.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

NOTES FROM BRITISH GUIANA.

By Our Regular Correspondent.

THE WAR AND THE BALATA INDUSTRY: HARD HIT.

THE balata season is now practically at an end. The laborers are returning from the hinterland for the Christmas holiday and bleeding operations have been suspended. The season has, on the whole, been a fairly good one, from a producing point of view, but from a selling point would have been more successful had not the war broken out and upset the market. Producers are now overcoming their anxiety with regard to exporting, and during the past two months fairly heavy shipments have been made. The government not having seen its way clear to provide a guaranty scheme against losses, producers have resolved to pay war risks on exports. With hundreds of laborers coming down from the grants to receive their earnings for the season, companies have had to convert their balata into cash. The margin of profit being small, the market unsettled and the cost of production increased by the necessary payment of war risks, the season, from which so much was expected, will probably prove not to have been so very profitable. This is doubly unfortunate, for after several years of drought the present season, during which weather conditions have been more favorable, was looked to to recoup the losses that producers have sustained during recent years. The result is that the balata industry still lacks that element of stability which would cause it to be regarded as one of the colony's industrial props. It has during the past five or six years passed through a very trying period. The rubber boom, with its inflated prices and the consequent exorbitant demands by labor, did it no good service, and the years of drought that followed aggravated the mischief. Now, when the opportunity for recovery presented itself, war has broken out and demoralized the market.

The war will have another depressing effect, namely, that it postpones for an indefinite period the hinterland railway project, the improvement of hinterland communications being a very important factor in the successful prosecution of the industry. Nevertheless, these things act only as a setback. Speaking at the quarterly meeting of the Chamber of Commerce the other day, the president, A. P. Sherlock, dealing with the effect of the war upon the industrial situation, said that the council had approached the government asking that assistance be given the gold, diamond and balata industries by advancing money to enable them to be carried on as formerly. That was at the time when it was difficult to make the usual financial arrangements. The government did not consider the situation sufficiently critical and, as regards the gold industry, he believed that there was no difficulty in that, although the diamond and balata industries were suffering severely at the moment. The balata industry, he was sorry to say, had been seriously affected by the war, but he could not help thinking that this condition was only temporary, because there must be an enormous waste, to make up for which a corresponding demand for balata must soon arise.

The balata export to September 23 was 883,392 pounds, as compared with 829,157 pounds to the same period last year. These figures may be expected to show an improvement before the end of the year, but there is reason to believe that if the war had not caused nervousness the exports this year would have reached record figures.

TAPPING EXPERIMENTS—SATISFACTORY RESULTS.

At a meeting of the Board of Agriculture, held recently, Professor J. B. Harrison, Director of Science and Agriculture, supplied figures in connection with the results of recent experiments. He announced that from November, 1913, to July, 1914, 983 pounds of wet Pará rubber had been obtained

at the North Western station from 279 trees. This was equivalent to about 700 pounds dry rubber, giving a return of over 2 pounds per tree, being a very satisfactory yield for rubber trees tapped for the first time. He also reported that the rubber trees the Board had planted at Christianburg, on the Demerara river, had made very good progress during the last two years. At one time it appeared that the experiments would be a failure, but they now promised to be a success. These trees were 4½ to 5½ years old, and he would like the consent of the Board to tap them for experimental purposes. It was decided that these trees should be tapped. The agricultural expert of the "Daily Chronicle," commenting upon these returns, says: "It is gratifying to note that the results of the tapping of the *Hevea Brasiliensis* trees growing on the experimental fields at the North Western station were particularly encouraging. A return of 700 pounds of rubber from 279 trees at the first tapping is a distinct success and bears out the contention which has been expressed in these notes for the last ten years and more, that there is every reason to believe that rubber can be grown successfully in British Guiana. Had the Board of Agriculture been more active we should have known this in time to have shared in the great rubber boom. However, better late than never."

PANAMA RUBBER EXPORTS.

Exports of crude rubber from the Republic of Panama to the United States for 1912 represented \$46,600 and for 1913, \$19,016. The bulk of the shipments was from the consular district of Panama City, from which the rubber exports for the two years named amounted to \$43,800 and \$17,313.

Balata, shown separately, figures as \$20,592 and \$108,920 for the years 1912 and 1913.

HONDURAS RUBBER EXPORTS.

The rubber exports of the Republic of Honduras for the fiscal year ended July 31, 1913, represented \$35,630, of which amount shipments to the United States were \$33,797. This amount was less than one half that of the preceding annual period.

GUATEMALAN RUBBER EXPORTS.

Guatemalan exports of rubber amounted in 1913 to 200,006 pounds, value \$100,323. Of this sum the United States' share was \$39,960, or about half that of 1912.

ECUADOR'S RUBBER SHIPMENTS.

The value of Ecuador's rubber shipments is shown as follows by Consul General Frederic W. Goding, of Guayaquil:

	Pounds	Value
1912	\$698,965
1913	427,732	178,754

NICARAGUA'S RUBBER EXPORTS TO UNITED STATES.

Consul Harold D. Clum, of Corinto, reports exports of rubber from that point as follows: 1911, \$320,335; 1912, \$182,272; 1913, \$100,523. From the San Juan del Sur district they were: 1912, \$119,919; 1913, \$112,056.

The above-named points combined deal with 86 per cent. of the total exports.

Total exports of rubber from Nicaragua to the United States represented a value in September last of \$14,864, against similar exports for September, 1913, of \$2,936. During August, \$12,693 worth of rubber was exported from Nicaragua to this country, against \$4,016 worth in the preceding August.

EXPORTS OF BALATA FROM VENEZUELA.

Exports of balata from Venezuela to the United States for the months of August and September, 1913 and 1914, are reported by the American Minister at Caracas as follows:

	Pounds	Value
August, 1914	1,188,000	\$44,001
August, 1913	2,354,000	95,722
September, 1914	1,936,000	53,268
September, 1913	132,000	5,211

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED OCTOBER 6, 1914.

- 1,111,568. Vehicle wheel rim. F. L. Sessions, Lakewood, assignor to The Standard Welding Co., Cleveland—both in Ohio.
 1,111,596. Means for tire inflation. L. Baugerat, Jr., Orléans, Ill.
 1,112,603. Vehicle wheel rim. C. W. Gressler, assignor to The Standard Welding Co., both of Cleveland, Ohio.
 1,112,615. Air containing body for an aircraft. E. D. Hollidge, Washington, D. C.
 1,112,635. Resilient heel. V. May, Chicago, Ill.
 1,112,718. Spring wheel. J. O. Nelson, Ashtabula, Ohio.
 1,112,749. Rubber heel. F. S. Abbott, Malden, Mass.
 1,112,772. Composition containing annealed steel wool and rubber. J. P. Grier, Chicago, Ill.
 1,112,865. Portable buffer. W. C. Stevens, assignor to The Firestone Tire & Rubber Co., both of Akron, Ohio.
 1,112,881. Life preserver and trunk. N. G. Abbate, Baltimore, Md.
 1,112,931. Resilient wheel. B. R. Pihlbor, Dothan, Ala.
 1,112,932. Cushion heel for foot gear. J. Preizer, Monaca, Pa.
 1,112,938. Process for the improvement of inferior grade rubbers. D. Spence and W. J. Russell, Akron, Ohio, assignors to The B. F. Goodrich Co., New York, N. Y.
 1,112,942. Cushion heel. E. Stoller, Kittanning, Pa.
 1,113,009. Sectional core for hollow rubber articles. T. Howard and G. B. Clegg—both of Providence, R. I.
 1,113,020. Writer's arm rest. S. J. King, Belton, S. C.
 1,113,036. Tire. H. E. Mitchell, Coon Rapids, Iowa.
 1,113,069. Atomizer. S. Lerski, San Francisco, Cal.
 1,113,074. Late saving suit. C. B. Voeppel, Mansfield, Mass.
 1,113,083. Pessary. M. B. Arnold, McAlester, Okla.

Design.

- 46,516. Tire. J. E. Lee, Conshohocken, Pa.

Trade Marks.

- 75,897. The Goodyear Tire & Rubber Co., Akron, Ohio. The word *Goodyear*. For belting.
 75,995. The Goodyear Tire & Rubber Co., Akron, Ohio. The words *Red Wing*. For rubber packing for machinery.
 80,072. The Striking Gum Co., Inc., New York, N. Y. The words *Golf Ball*. For chewing gum.

ISSUED OCTOBER 13, 1914.

- 1,113,266. Boat ventilator. R. W. Chert, Dresden, Germany, assignor to Sonne Rubber Inner Heel Co., New York, N. Y.
 1,113,386. Wheel and tire therefor. H. Kitcher, Toronto, Ontario, Canada.
 1,113,446. Shoe for ladders. C. D. Kline and E. Nall, assignors to The Goodyear Tire & Rubber Co., both of Akron, Ohio.
 1,113,447. Wrapping machine. C. Kuentzel, assignor to The Goodyear Tire & Rubber Co., both of Akron, Ohio.
 1,113,513. Machine for covering bead cores. W. C. Tyler and E. Nall, assignors to The Goodyear Tire & Rubber Co.—all of Akron, Ohio.
 1,113,614. Colored caoutchouc substances and process of making same. K. Gottlieb, assignor to Farbenfabriken, vorm. Friedr. Bayer & Co.—both of Elberfeld, Germany.
 1,113,630. Process for the production of caoutchouc substances. F. Hoffmann and C. Contelle, assignors to Farbenfabriken, vorm. Friedr. Bayer & Co., all of Elberfeld, Germany.
 1,113,631. Production of caoutchouc substances. F. Hoffmann and C. Contelle, assignors to Farbenfabriken, vorm. Friedr. Bayer & Co., all of Elberfeld, Germany.
 1,113,645. Cushion heel. E. Jones, Indianapolis, Ind.
 1,113,695. Renewable rubber heel device. W. M. Sanford, Hartford, Conn.
 1,113,759. Colored caoutchouc substances and process of making same. R. Dittmar, Graz, Austria-Hungary, assignor to Farbenfabriken, vorm. Friedr. Bayer & Co., Elberfeld, Germany.
 1,113,831. Upper for tennis shoes. C. H. Roper, Belmont, assignor to Heel Rubber Co., Watertown—both in Mass.
 1,113,843. Foot and shampoo comb. Gertrude Smith, Valdosta, Ga.
 1,113,912. Cap for resilient wheel tires. F. V. Roesel and C. H. Franks—both of Akron, Ohio.
 1,113,925. Pneumatic tire mold. G. E. Batcheller, Mount Vernon, N. Y.
 1,113,934. Tread for resilient tires. E. F. Edgecomb, Cuyahoga Falls, Ohio.

Designs.

- 46,537. Vehicle tire. W. D. Morris, assignor to The Republic Rubber Co.—both of Youngstown, Ohio.
 46,538. Vehicle tire. W. D. Morris, assignor to The Republic Rubber Co.—both of Youngstown, Ohio.

Trade Marks.

- 78,589. Puncture Seal Manufacturing Co., Dayton, Ohio. The word *Zimco*. A puncture proofing substance for the inner tube of a pneumatic tire.

- 78,598. The Toronto Rubber Co., Toronto, Ohio. The word *Acoute*. For heat pads.
 79,001. The St. Joseph Paper Co., St. Joseph, Mo. The word *Wallow*. For floor covers.
 79,400. J. G. Stearns, Chicago, Ill. An illustration of a shovel with the words *Cliff Road*. For rubber boots and shoes.
 80,000. The Republic Rubber Co., Youngstown, Ohio. The word *Striggard*. For elastic tires.

ISSUED OCTOBER 20, 1914.

- 1,114,052. Fountain pen. W. A. Sheaffer, Fort Madison, Iowa.
 1,114,161. Spring wheel. W. L. Mann, St. Joseph, Mo.
 1,114,236. Tire vulcanizing mold. M. A. Dees and N. L. McLeod, assignors to American Tire Co., St. Louis, Mo.
 1,114,276. Resilient wheel. J. B. Lynch, Syracuse, N. Y.
 1,114,280. Mold for pneumatic tires. N. W. McLeod, St. Louis, Mo., and M. A. Dees, Pascagoula, Miss., assignors to American Tire Co., St. Louis, Mo.
 1,114,302. Cushion heel. S. D. Smith, East Dedham, assignor to J. C. Kennedy, Boston—both in Mass.
 1,114,306. Solid rubber tire. J. G. Stidder, Harrow, England.
 1,114,353. Sliding shoe for furniture. W. T. Hight, Boston, and G. W. Hight, Jr., Quincy—both of Mass.
 1,114,443. Tire casing. W. Bryant and J. J. McCann—both of Winnipeg, Manitoba, Canada.
 1,114,556. Tire sleeve. F. Aitah, Healdsburg, Cal.
 1,114,561. Syringe. A. E. Wible, New York, N. Y.
 1,114,600. Resilient tire. J. Gaynor, New York, N. Y.
 1,114,685. Pneumatic heel for boots and shoes. G. T. T. Freeman, Southsea, England.

Design.

- 46,508. Sole for footwear. W. R. Hopwood, assignor to The Beacon Falls Rubber Shoe Co.—both of Beacon Falls, Conn.

Trade Marks.

- 63,462. Hood Rubber Co., Boston, Mass. A black circle with the words *Bulls Eye*. For rubber boots and shoes.
 77,863. Herman Moritz & Escalator Shrinking Co., Inc., New York, N. Y. An oblong with the word *Knorain* in some. For rain-coats.
 78,660. Rogers Peet Co., New York, N. Y. The word *Gymkhana*. For baseball, basket ball, tennis balls, exercisers, etc.
 80,015. Protectair Manufacturing Co., Wilmington, Del., and Philadelphia, Pa. Representation of a wheel and pneumatic tire with the word *Protectair* on the tire. A liquid for the sealing of punctures in pneumatic tubes.
 80,313. American Lead Pencil Co., New York, N. Y. The word *Velvet*. For rubber erasers.
 80,366. Millwall Rubber Co., Ltd., London, England. The word *Pax*. For rubber heels and soles.
 80,548. Plymouth Rubber Co., Canton, Mass. A knot with the word *Slipknot* underneath it. For rubber heels for boots and shoes.
 81,114. The Worthington Ball Co., Elyria, Ohio. The word *King*. For golf balls.
 81,115. The Worthington Ball Co., Elyria, Ohio. The words *Queen Bee*. For golf balls.
 81,116. The Worthington Ball Co., Elyria, Ohio. The initial *A* within quotation marks. For golf balls.
 81,117. The Worthington Ball Co., Elyria, Ohio. The word *Ring*. For golf balls.
 81,118. The Worthington Ball Co., Elyria, Ohio. The word *Jack*. For golf balls.

ISSUED OCTOBER 27, 1914.

- 1,114,732. Machine for making tire casings. F. B. Converse and F. A. Kress, both of Akron, Ohio, assignors to The B. F. Goodrich Co., New York, N. Y.
 1,114,739. Life preserver. M. Dobuch, Nanty Glo, Pa.
 1,114,819. Shoe bottom filler and method of making. A. Thoma, Cambridge, Mass., assignor to North American Chemical Co., New York, N. Y.
 1,114,841. Composition for and process of revivifying and preserving rubber. A. A. Wright, Oakland, assignor to The Resilia Corporation, San Francisco—both in California.
 1,114,863. Eraser. R. A. Costello, Chicago Heights, Ill.
 1,114,930. Spring wheel. F. Stitzel, Louisville, Ky.
 1,114,965. Demountable rim. J. C. Cole, assignor to Fisk Rubber Co.—both of Chicopee Falls, Mass.
 1,115,015. Tire. W. J. Peterson, Brooklyn, N. Y.
 1,115,031. Process for treating rubber. G. Standon, Muskegon, Mich.
 1,115,082. Cushioned pneumatic tire. J. A. Menner, Paris, France.
 1,115,094. Life preserver. M. Nowacki, Camden, N. J.
 1,115,102. Time stamp. G. E. Perry, Chicago, Ill.
 1,115,107. Vaginal syringe. C. O. Rice, Denver, Colo.
 1,115,224. Syringe. C. D. McAllum, De Kalb, Miss.

- 1,115,240. Method of manufacturing resilient articles. L. T. Petersen, Youngstown, Ohio.
 1,115,409. Method of constructing pneumatic tires. F. S. Dickinson, New York, N. Y.
 1,115,430. Pneumatic tire. O. K. Hoppes, Tamaqua, Pa.

Designs.

- 46,592. Rubber brush. O. Lick, St. Louis, Mo.
 46,593. Rubber brush. O. Lick, St. Louis, Mo.
 46,594. Rubber brush. O. Lick, St. Louis, Mo.
 46,595. Rubber brush. O. Lick, St. Louis, Mo.
 46,596. Rubber brush. O. Eick, St. Louis, Mo.
 46,603. Rubber balloon cap. J. A. Murray, assignor to The Seamless Rubber Co., both of New Haven, Conn.

Trade Marks.

- 71,335. The Falls Rubber Co., Cuyahoga Falls, Ohio. A shield with a water fall scene. For inner tubes for tires, and tire casings.
 72,431. Braender Rubber & Tire Co., Rutherford, N. J. Representation of the heel of a bulldog with a shield clamped between its jaws with the word *Braender*. For inner tubes.
 75,990. The Goodyear Tire & Rubber Co., Akron, Ohio. The word *Kling-ree*. For rubber belting.
 78,842. The Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio. The word *Marathon*. For rubber tires, casings and tubes.
 80,210. Revere Rubber Co., Providence, R. I., and Chelsea, Mass. The word *Spring step*. For rubber horseshoes.
 80,426. Hudson & Thibber Co., Minneapolis, Minn. The word *Modoc*. For rubber belting, rubber hose, etc.
 80,596. Wm. Winkley, Jr., Co., Chicago, Ill. The word *Triplemint*. For chewing gum.
 80,737. The B & R Rubber Co., Brookfield and North Brookfield, Mass. The word *Librax*. For rubber soles and heels.
 81,070. Northern Shoe Co., Duluth, Minn. The word *Rebust*. For rubber and other shoes.
 81,495. W. B. Price, Poughkeepsie, N. Y. The word *Repelite*. For composition for waterproofing fabrics.
 81,496. W. B. Price, Poughkeepsie, N. Y. The word *Opacite*. For waterproofing composition for fabrics.
 81,497. W. B. Price, Poughkeepsie, N. Y. The word *Emla*. For waterproofing composition for fabrics.
 81,498. W. B. Price, Poughkeepsie, N. Y. The word *Densid*. For waterproofing composition for fabrics.

[NOTE. Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, post-paid.]

GREAT BRITAIN AND IRELAND. PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1913.
(Prior to Patents of American Inventions.)

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 7, 1914.]

- 13,480 (1913). Specific gravimetric estimating apparatus comprising ebullite tube. D. P. Battery Co. and T. C. Elliott both of Lamford Mills, Bakewell, Derbyshire.
 13,542 (1913). Rubber brush for vacuum cleaning apparatus. L. N. Reddy, Bank Chambers, Southampton Buildings, London.
 13,617 (1913). Covers and protectors for hats. I. Matzen, 35, Hermannstrasse, Alt-Rahlstedt, Schleswig-Holstein, Germany.
 13,624 (1913). Wheel tire. C. H. Clinton, 37, Westfield Road, Salford, Surrey.
 13,628 (1913). Blowpipe and ball. C. P. Elieson, 24, St. Mary Abbott's Terrace, Kensington, London.
 *13,637 (1913). Remson compounds. J. P. A. McCoy, 590, Holmes street, Wilkesburg, Pa., U. S. A.
 13,685 (1913). Match stands with ring of rubber. J. V. Davis, Willoughby House, Walsall Road, Willenhall, Staffordshire.
 13,700 (1913). Reducing rubber bearing plants. S. Goldreich and J. L. Palmer, 18, Rope-maker street, London.
 13,760 (1913). Lapping rubber and like trees. J. J. Hutton, Newlands, Ridge way, near Sheffield.
 13,845 (1913). Isoprene. C. K. F. L. Gross, Bevon, Soon, Norway.
 13,846 (1913). Synthetic caoutchouc. C. K. F. L. Gross, Bevon, Soon, Norway.
 *13,943 (1913). Detachable protector for the soles and heels of boots. G. F. Matzner, 54 South Ninth street, Minneapolis, Minn., U. S. A.
 13,948 (1913). Solid tire. C. S. Stone, 8, Cowdrey Road, South Wimbledon, London.
 14,007 (1913). Tire ring rubber bearing plants. J. L. Palmer, 18, Rope-maker street, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 14, 1914.]

- 14,081 (1913). Table game. R. Hampson, 30, Hawthorn Road, New Merton, Farnsworth, near Manchester.
 14,099 (1913). Chewing lozenges consisting of a rubber or other sponge. M. Falk, 85, Moltkestrasse, Köln, Germany.
 *14,117 (1913). Elastic cords, garters, belts, etc. M. W. Schloss, 291 South avenue, New York, U. S. A.
 14,138 (1913). Coated rubber surfaces for washing clothes. R. Hogg, 2, Clepston Avenue, Liscard, Cheshire.

- *14,244 (1913). Heel band of end lasting mechanism comprising a band of balata. M. Brock, 15 Woodville street, Roxbury, Mass., U. S. A.
 14,251 (1913). Wheel for elastic or pneumatic tire. R. Kronenberg, Ohligs, Rhine Province, Germany.
 14,281 (1913). Spring wheel with continuous outer ring and pneumatic rubber ring and like cushions. F. Hayes, 3, Beech Road, Woodhey, Rock Ferry, Cheshire.
 14,332 (1913). Floats for hydro-aeroplanes comprising upper and lower members held apart by resilient means formed of india rubber. H. Farman, 167, Rue de Silly, Billancourt, Seine, France.
 *14,363 (1913). Spring wheel. J. H. W. Kepler, Rural Route No. 1, West Alexandria, Ohio, U. S. A.
 14,403 (1913). Tire attachment to rims. T. Dunn, 27, Louisville Road, Upper Tooting, London.
 14,481 (1913). Phenol formaldehyde resins. H. Stockhausen, 25, Bakerpfad, Crefeld, and R. Guhl, 2, Kaiser Friedrichstrasse, Charlottenburg, near Berlin both in Germany.
 14,517 (1913). Rubber impregnated packing. G. H. Cook, Lion Works, Gifford street, Poplar, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 21, 1914.]

- 14,621 (1913). Trousers provided with an elastic gusset on each side of the waist. A. Woodbine, 16, North street, Wellingborough.
 14,724 (1913). Feeding bottles. R. S. Dowell, Globe Works, Chatsworth Road, Clapton Park, London.
 14,744 (1913). Spring wheel with continuous outer rigid ring and pneumatic cushions. T. Unsworth, 34, Park street, St. Kilda, Victoria, Australia.
 14,789 (1913). Road paving blocks with rubber faces. A. S. Morrison, 37, Northgate, Regent's Park, London.
 14,801 (1913). Vapour bath having a covering of waterproof fabric. I. Gyenes, Kaposvar, Hungary.
 14,897 (1913). Fountain pens. C. Pickett, "Fernleigh," Town Green, near Ormskirk, Lancashire, and E. E. E. Emmerson, 26, Kirkland avenue, Higher Trannmere, Cheshire.
 15,066 (1913). Cloaks of waterproof material. R. Meyer, Bot. 24, Barcelona, Spain.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 28, 1914.]

- 15,112 (1913). Game comprising rubber table pads. R. W. Buckby, 2, Gladstone street, Leicester.
 15,139 (1913). Apparatus with bulb for treating diseases with radiations, etc. O. Samuely, 105, Dalmatstrasse, Charlottenburg, Germany.
 15,185 (1913). Dress shields. W. R. Weeks, 1, Ramilies street, Great Marlborough street, London.
 15,213 (1913). Teat cup for cow milkers. R. Kennedy, 3, Spungskell avenue, Pollok-shields, Glasgow.
 15,249 (1913). Self sealing air tube for wheel tires. F. C. R. Marks, 57, Lincoln's Inn Fields, London.
 15,447 (1913). Toothbrush holders. R. M. Withycombe, 283, Elizabeth street, Sydney, Australia.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

- 470,499 (June 16, 1913). Process of making fabrics for tire covers. E. Dranlutte.
 470,586 (April 7, 1914). Elastic tire for vehicle wheels. W. H. Carmont.
 470,647 (April 8). Hydro-pneumatic tire for vehicle wheels. A. F. Grenneillon.
 470,653 (April 8). Rubber syringe in one piece, and its process of manufacture. J. Lick & Co.
 470,717 (April 9). Pneumatic heel for footwear. G. Freeman.
 470,745 (April 10). Perfected movable elastic heel and its system of attachment. E. A. Nolan.
 470,833 (June 24, 1913). Process for vulcanization of rubber. J. Bastide.
 470,879 (March 2, 1914). Improvements in processes and appliances for mulling rubber articles. F. T. Roberts and R. H. Rosenfeld.
 470,885 (March 10). System of rim for pneumatic wheels. J. E. Serste.
 470,961 (April 10). Improvements in tires for vehicle wheels. W. E. Muntz.
 471,002 (April 16). Mudguard for automobiles and other vehicles. A. C. Adams.
 471,010 (April 16). Improvements in tires for vehicle wheels. M. Perot and J. E. Daubré.
 471,175 (April 21). Elastic tire principally intended for heavy automobiles and trucks. A. Borson and A. Preuss.
 471,201 (July 3, 1913). Improvement in detachable rim. A. L. F. Prat.
 471,231 (April 2, 1914). Improvements in appliances for treating latex. H. A. Wickham.
 471,344 (April 25). Antiskid for automobile wheels. M. Malik.
 471,403 (April 27). Machine for manufacture of gummy compounds. F. Kempter.
 471,415 (April 27). Mudguard for automobiles. Quévrain and Desmedt.
 471,457 (April 28). Improvements in pneumatic tires. H. A. Lepetit.
 471,518 (April 30). Improvements in elastic tires for automobiles and other vehicles. H. Diamant.
 471,625 (February 21). Shock absorber adaptable as a flexible wheel tire. O. J. Hobson.
 471,732 (April 30). New type of tire for road vehicles. W. C. Sneyd and R. Billington.

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

- 279,271, Class 30b (February 1, 1911). Apparatus for making rubber objects. Elizabeth Lambert, Eisenbahnstrasse, 40, Berlin-Wilmersdorf.
- 279,370, Class 71a (January 31, 1914). Rubber tire treads with applied leather portions. Minna and Agatha Reich, Schillerstrasse, 2, Northheim.
- 279,483, Class 63c (November 23, 1913). Acoustic indication of air escaping from pneumatic tires. Haghart Sylvester Christopherson, Odense, Denmark.
- 279,484, Class 63c (November 30, 1912). Pneumatic wheel tires or hose. Eduard Breuer, Pilsen.
- 279,666, Class 63c (January 17, 1914). Pneumatic tires, in which the air tube has a thickened portion, which automatically closes punctures. Carl Leichmann, vor dem Harttor, 13, Geldern.
- 279,644, Class 30d (December 5, 1913). Adjustable truss, with spherical continuation. Karl Willig, Suhl, Thüringen.
- 279,649, Class 39a (November 16, 1913). Mixing machine, specially for rubber. Fritz Kempter, Heinestrasse, 10, Stuttgart.
- 279,735, Class 30d (March 13, 1914). Appliance for prevention and cure of flat feet. Emil Huber, Karschlautern.
- 279,780, Class 39b (January 10, 1913). Process for improving synthetic products resembling rubber. Badische Anilin- und Soda Fabrik, Ludwigshafen.
- 279,801, Class 63c (January 9, 1914). Rubber tires with hollow chambers arranged one above another. Albert Witzel, Ludwigshurg.
- 279,835, Class 39b (January 28, 1913). Process for manufacture of products resembling vulcanized rubber. Badische Anilin- und Soda Fabrik, Ludwigshafen.
- 279,980, Class 63c (February 15, 1913). Process of manufacture of tires from discs arranged radially with respect to a ring. Divine Tire Co., Utica, N. Y.
- 280,025, Class 63c (February 10, 1914). Protective cover for treads of pneumatic tires. Wilhelm Dietz, Aeussere Sulzbacher Strasse, 34, Nürnberg.

RUBBER MEN ATTEND THE FIRE ENGINEERS' CONVENTION.

The convention of the International Association of Fire Engineers, held at New Orleans, Louisiana, October 20-23, was attended by many representatives of the rubber companies, who enjoy associate membership in the organization, as well as by active members. Among these representatives were the following: For the Bilateral Fire Hose Co.—Clay Bird, of Chicago; Dayton Rubber Manufacturing Co.—John A. MacMillan, of Dayton, Ohio; Eureka Fire Hose Co.—S. P. Blanck, P. O. Herbert and C. B. Payne, of Atlanta, and Thos. B. Galbraith, of New York; Fabric Fire Hose Co.—A. C. Hopper, of Dallas, Texas, and J. J. Rafter, of Atlanta; Firestone Tire & Rubber Co.—Geo. A. Talbot, of Akron; The B. F. Goodrich Co.—A. H. Leavitt, Akron; Goodyear Tire and Rubber Co.—J. E. Davies, and F. H. Sawyer, of Akron; Sewell Cushion Wheel Co.—E. H. Milliken, Boston, and H. J. Sewell, Detroit.

UNITED STATES IN THE MARKET FOR DIRIGIBLES.

Announcement has been made that the United States Government is considering the purchase of four dirigible balloons for military purposes and that it has in view arrangements to assist manufacturers of this class of equipment. Several firms have been organized in this country for the construction of dirigibles.

TESTING OF RUBBER GLOVES.

It is customary for electric light and power companies to furnish rubber gloves to those of their employees who may have occasion to work on high tension apparatus. Since it is impossible to detect by visual examination very minute defects, such as pin-holes, a high voltage test is necessary to insure that the gloves worn by the men will not break down when being used on "live" apparatus. A great many of the central station companies also test the gloves used by their men periodically so as to insure that no gloves will be in use which have been mechanically injured. Since the user depends absolutely upon the gloves for protection, it is obvious that every precaution should be taken to insure that this confidence is not misplaced.

The most usual practice in testing gloves consists in filling the gloves with water and then immersing them in a can of water. The electrodes are connected to the water in the glove and the water in the can, the electric current being applied to the electrodes and raised gradually at a uniform rate until the test voltage is applied to the glove, which varies from 3,000 to 10,000 volts, depending upon the kind and quality of glove and the service for which it is intended. The test voltages employed vary from one and one-quarter to two times the voltage of the circuit upon which the gloves are to be used. The time of application of the voltage varies from one minute to five minutes. An ammeter is connected in the test circuit and all gloves are rejected whose insulation resistance is so weak that the current flowing through the glove exceeds 10 milliamperes at 10,000 volts. It is obvious that while the

current flowing through the glove may not be sufficient to cause a puncture (a puncture is simply the result of sufficient current having flowed through the glove at a defect to produce enough heat to cause destructive defects still it may be sufficient to shock the user without producing any visible effect upon the glove. Theoretically, some current flows through the glove in any case, its value depending

simply upon the resistance of the glove. If the resistance is sufficiently high the current is infinitesimally small, while if the resistance is low the current becomes large and serious results follow. Obviously then the amount of permissible current should be limited, because a current which will produce a severe shock to the wearer of the glove may produce no material defect in the glove itself. The limit of 10 milliamperes has been established, as this is sufficient to produce a distinct shock. While this current in itself would not ordinarily injure a person, the muscular reaction resulting from the shock might cause a man to fall from a pole or ladder and thus injure him from the secondary cause.

The accompanying photograph of the testing equipment at the Electrical Testing Laboratories, New York, shows the method of suspending water-filled gloves in metal cans for test.

GLOVE TESTING EQUIPMENT OF THE ELECTRICAL TESTING LABORATORIES, NEW YORK.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

THIS is not an active period for the chemicals used in rubber works, and trading is along quiet lines. The situation in regard to many materials remains complicated and is not likely to clear up until a way has been found to restore the foreign materials which have been cut off. The lead pigments are holding steady and are meeting with a fairly good outlet in the various consuming channels. Linseed oil has gained in strength. Variations in the price of seed have affected the market for oil. Zinc oxide is in good demand with other trades helping the market. The spreading of mines along the shores of Europe has made uncertain the exportation of many articles which otherwise would reach here, and among these may be mentioned chalk. The situation in chalk is reflected in the market for whiting, as makers of the latter are not anxious to sell ahead till they can get stocks of raw material from England. French chalk is not on the market. Lithopone and barytes are affected by difficulties of transportation, and foreign makes have been in limited supply since the disturbance began.

THE RUBBER SCRAP MARKET.

AT the opening of the month, dealers were purchasing boots and shoes at 6 1/2c. to 6 3/8c., while mills had reduced their offers from 7 1/4c. to 7c., with only limited transactions at 7 1/8c. Some dealers were holding out for 7 1/4c. Boots and shoes were, however, in quiet but steady demand, while the quantity offered was smaller than was the case in former years. Owing to the conditions of the market, the limited nature of the supply was not so apparent as would otherwise be the case. Dealers are not being offered large lots at present. At the close of the month they were finding it difficult to get supplies below 6 3/4c., although in a few instances they claim to have got in at 6.5c. to 6.6c. Consumers have been obliged to pay 7 1/4c., but the volume of business has been limited.

In auto. tires the volume of business has remained small. The price given by consumers, which at the beginning of the month was 4 3/8c., declined to 4.4c., at which figure business was done, some sales having been effected at 4 3/8c. Large dealers had been quoting 4 1/2c., without finding a response from buyers, while they have been offering from 4c. to 4.2c., according to size of lots. Reports of sales to mills at 4 1/2c. have not been confirmed. Solid tires have been quoted to dealers at 4c., while the latter have been asking consumers 4 1/2c.

In the earlier days of the month weakness characterized the market for inner tubes, 20c. having been offered by consumers for No. 1, while dealers were holding out for 21c. and 22c., they themselves paying 20c. The absence of movement had led to an accumulation in the West. At a later period of the month, the market became somewhat firmer, dealers being in a better position and getting an average of 22 1/2c. and 23c. delivered. No. 2 was held nominally at 12 to 13c.

Generally speaking, the prices of scrap in the concluding week of the month were steady and unchanged, reclaimers not exceeding their actual requirements.

Review of the Crude Rubber Market.

THE present crude rubber market is certainly a most interesting one. It is safe to say that never before was it surrounded by so many elements of uncertainty. Will the English actually retain all the plantation rubber from British colonial ports, and if they do, what will they do with receipts of 34,000 tons, during the next six months? Can England use it? Can the Allies together use it? It is six times as much rubber as England used in the corresponding six months a year ago. Then again, will the English be able to get plantation rubber or will the Turks succeed in bottling up the Suez Canal? Will the Eastern planters continue to ship rubber to England under the risks involved or will they conclude to open a new chapter in Eastern exportations and ship their rubber direct to the United States by way of the Pacific, as some has already come?

Then again, how about the American rubber manufacturers? Will this much-heralded and often banqueted Prosperity put in an early appearance, so that home orders will call for a large supply of material, or will the American manufacturer have to look to the military needs of the Allies for export orders to counterbalance a decreased home consumption, and in that event, how much crude rubber is he going to need?

It really is rather a puzzling situation and it is not to be wondered at that manufacturers find themselves in something of a quandary and that the crude rubber importers are by no means all of one mind as to the outlook.

The New York market during the first half of the month was very steady, and it was not until the trade learned of England's absolute embargo on all British-controlled rubber that a feeling of nervousness began to appear. Fine hard Pará opened the first of November at 66c., and during the first two weeks varied from 63c. to 66c., not going beyond 67c. until the 25th. On the 27th it reached 71c. and on the 28th was quoted at 70@71c.

Plantation rubber shows a marked gain for the month. First Latex opened on the first of November at 61@62c. and had advanced by the 5th to 66c. Then, upon the destruction of the "Emden," it fell again on the 14th and 16th to 60c., from which point it rose steadily until it was quoted on the 28th at 75c., with smoked sheet at 80c.

The receipts of rubber from Pará during the month amounted to 1,200 tons, with 400 tons more now afloat for December arrival. The receipts of plantation rubber amounted to 2,583 tons. It is estimated that there is now afloat from Ceylon to London about 700 tons of plantation, in three boats, namely—the "St. Egbert," "City of Delhi" and "Kabinga"; but under the present embargo of course none of this will reach the New York market.

About 250 tons of guayule were received during November, but of Pontianak there has been no receipt since September 20. About 400 tons of Pontianak are now on their way from the East to London, part of this amount being on the "St. Egbert" and part on the "Kazendi."

Advices from Germany are to the effect that all the crude rubber in that country is now being used for tires and other military equipment. The price of Plantation has reached \$1.40@1.50 a pound.

What the market will do in December is anybody's conjecture. The answer would be easy if one only knew what the British Government had in its mind.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "The market for Commercial paper has improved very much during November, with declining rates, which during the early part of the month were 6@6 1/2 per cent. for the best rubber names and 7@7 1/2 per cent. for those not so well known, but towards the end of the month these rates declined to about 5 1/2 @ 5 3/4 per cent. and 6@7 per cent., respectively."

Nine months, 1912.....	2,533,635	443,443	2,977,078

GEORGE E. PELL A RUBBER BROKER.

Early in November Mr. George E. Pell opened an office as a general rubber broker in the Produce Exchange Annex, New York. Mr. Pell ought certainly to be very familiar with crude rubber, as there are very few men in the trade who have viewed it from so many different standpoints. About 15 years ago he went to Para, and remained there and in Manaos for 5 years, being associated first with Geo. A. Alden & Co. and later with Gordon & Co. While in Manaos he was the American consular agent. About ten years ago he returned to America and became connected with the General Rubber Co. In this association he made quite an extended visit to the guayule territory of Mexico, some six years ago, and within the last year or two he has visited the great rubber plantation in Sumatra in which the United States Rubber Co. is interested. At the Rubber Exhibition held in New York in the fall of 1912 Mr. Pell acted as the official representative of the Commercial Association of Para.

Messrs. R. A. & C. H. Loewenthal, treasurer and secretary, respectively, of the U. S. Rubber Reclaiming Co., Inc., with factories at Buffalo and offices in the Forty-Second Street building, have recently made application to the Supreme Court to have the name changed to "Low," in consequence of the fact that official notification has gone forth that passports issued in any German name will hardly facilitate travel to the bearer in England, France or Russia; and as both these gentlemen have occasion to make frequent trips abroad they have decided that the change would very materially promote their convenience. In addition to the inconvenience before described the name was seldom properly spelled, so that the change from Loewenthal to Low will effect an advantage in this respect.

In accordance with its usual Thanksgiving custom, the Monati-quot Rubber Works Co., of South Braintree, Mass., presented its married employes with turkeys, while the unmarried received cigars and candy.

our products not as good as
it to be? Probably I can
how to make them right.
anyway.

THE TROPICAL AGRICULTURIST and Journal of the Ceylon Agricultural Society

The Tropical Agriculturist (fully illustrated) is now an official publication with special scientific papers in addition to many of its old features.

Edited by R. N. Lyne, F. L. S., F. R. G. S.
 Director of Agriculture, Ceylon.

Rubber Cultivation and the Chemistry of Rubber form one of the features of the Journal: full information on Ceylon and Malay Peninsula methods and progress. All about Tea, Coffee, Cocoa, Tobacco, Cinchona, Cinnamon, Fibre Plants, Coconuts and other Palms, Citronella, Lemon Grass and Essential Oil Grasses, and all tropical products.

Rate of Subscription for America, including postage:

YearlyIn advance \$5.00

The Tropical Agriculturist circulates throughout the world, especially in the Tropics, and is a first class advertising medium.

Full particulars re Advertisements on application to

Messrs. Maclaren & Sons, Ltd., 37 & 38, Shoe Lane, London E. C.
 or to the "TROPICAL AGRICULTURIST," PERADENIYA; or

TABLE OF CONTENTS ON LAST PAGE OF READING.

THE SEASON'S COMPLIMENTS.

YOU who read this, whatever your place in the world's rubber trade, are given our Happy New Year. May 1915 bring prosperity and content. May all race prejudice vanish and wars cease. May efficiency and fair-dealing, wealth and integrity, join hands.

OUR CONTEMPORARIES

SINCE the great war's beginning scores of trade journals large and small have ceased to exist. This is particularly true in England, Germany and France. Those that remain are perforce the necessary ones. At the same time, with the unavoidable curtailment of advertising, the disintegration of subscription lists and slow collections, the burden of publishing has been greatly augmented.

The English "India Rubber Journal" is one of the few to continue to appear regularly and shows no sign of slacking in interest. Congratulations and felicitations!

The "Gummi-Zeitung" also arrives regularly, having

been interrupted for some four issues only. In subject matter and as a whole it bears no evidence of unusual conditions at home or abroad. Or, more exactly, there is one difference—no market quotations for crude rubber are appended as of yore. A letter from Editor Springer in another column gives a good idea of rubber conditions in Germany.

Our very interesting contemporary "Le Caoutchouc & la Gutta-Percha" has unfortunately been forced to suspend publication. A. D. Cillard, its able editor, writes as follows:

"All our collaborators and workers are at the firing line. Some of them have already fallen on the field of honor. We have no one any longer here. There is no business and the losses experienced by our publication, 'Le Caoutchouc & la Gutta-Percha,' are such that its existence is compromised, unless some powerful firms consent to come to its help. But we do not venture to count on this. This is our situation. It is most painful for us who have taken such pains to produce this review."

THE RUBBER EMBARGO.

THE Rubber Embargo has not been lifted. The newspapers from time to time say that it has, but they are in error. In the meantime, the American Rubber Committee have done everything possible at Washington and are in close touch with the British Committee in London. Very wisely, they have insisted on keeping the rubber embargo separate from all other embargoes, as, for example, wool, graphite, etc. They are also at work upon a form of guarantee, which it is hoped will be acceptable to the British Government. In this connection a newspaper note that is going the rounds is of special interest. It reads:

"A continuance of the rubber embargo for a protracted period will have the result of putting a large number of people out of employment. It will also raise prices to consumers of rubber goods to almost unprecedented figures, and will particularly affect every user of an automobile. If the American manufacturers are obliged to depend upon rubber from Brazil, which would seem almost inevitable if this embargo is indefinitely continued, they will be in the position of manufacturing their goods from rubber purchased at an extraordinarily high price, with the possibility that at any time Great Britain might decide under certain conditions to raise this embargo. This would immediately bring the price of crude rubber down to practically a normal figure, and leave the manufacturers with a stock of merchandise on their

hands manufactured at a high cost. In this case a deplorable condition would arise and it might be necessary to seek the aid of Congress to place a temporary embargo on crude rubber and rubber products from Great Britain, so that American manufacturers might know where they stand and be protected against incalculable loss.

It is very much to be hoped that Great Britain will realize the injustice which is being done to American rubber manufacturers, particularly as these manufacturers and the rubber importers are undoubtedly willing to give a guaranty that they will not export to her enemies rubber or such manufactured articles as may be declared contraband of war."

THE RUBBER INDUSTRY 25 YEARS AGO AND NOW.

THIS is not a history of the growth of the rubber industry in the United States for the last 25 years. A book of 1,000 pages written by a master of condensation would not contain the story, for no other American industry has made such strides in the last quarter century.

These few paragraphs can only hope to project some of the most striking features in that development and to show the contrast between the rubber trade in 1889, when this publication first appeared, and at the present time. During these 25 years the rubber industry of the United States has increased tenfold in its capitalization, fourfold in the value of the manufactured product, fourfold in the number of employes and sixfold in volume of its exports. In 1889 the total capitalization of the rubber manufacturing companies in the United States was about \$40,000,000; the consumption of rubber amounted to 16,000 tons; the number of people employed was 20,000, and the value of manufactured product \$60,000,000. Now, the capitalization is about \$400,000,000; the annual consumption of crude rubber amounts to 50,000 tons; the number of people employed exceeds 80,000, and the value of the finished product is in the neighborhood of \$240,000,000.

But in surveying the last two and a half decades of the American rubber industry, the most striking feature is not this great general growth, but rather the entrance into the field and the rapid development of several new factors entirely unknown 25 years ago but which today are of commanding importance.

First there is the automobile tire, which now uses fully one-half of the rubber supply of the world;

which consumes more crude rubber today than the whole world produced 25 years ago; which is made and consumed to the number of 9,000,000 a year in the United States alone, with a value of \$125,000,000. And yet when the first issue of THE INDIA RUBBER WORLD was published there was not an automobile tire in existence. There were bicycle tires, and they were made in fairly large numbers, for the bicycle fever was then nearing its height, but there was no auto. tire, because there was no automobile.

There was then no manufacture of aeroplane or dirigible fabric, and the balloon as a practical utility was undreamed of. The construction of balloons and aeroplanes is not yet an extensive industry in the United States, but across the sea great advancement has been made, especially in Germany, whose military achievements have been much assisted by these overhead scouts.

Another marked development that has taken place during the last 25 years has been the advent of the great corporation. In 1889 there was hardly a company engaged in rubber manufacture in this country that was capitalized at over \$1,000,000. Now there are four companies alone whose combined outstanding capital is over \$200,000,000.

But the most important development of the quarter century just past is not in the direction of manufactures or finance, but in the direction of the crude supply—in the development of the rubber plantation. If the trade were still dependent on the wild product of the South American and African forests, rubber manufacture would only have reached half its present proportions, for it would have only half its present supply of material. In 1889 the output of the Amazon country was about 16,000 tons; in 1914 it was 40,000 tons, but constituted only 40 per cent. of the world's supply. To be sure, under the stimulus of the higher prices that would have accompanied a restricted supply, wild rubber regions would have been more exhaustively exploited, but they could not have possibly yielded a total equal to the 70,000 tons which the plantations will be easily capable of producing during the present year. With the success of the plantation now overwhelmingly demonstrated, there is positive assurance—or as positive as any human assurance can be—that, no matter what demands the trade may make in the future, the supply will always suffice.

Accordingly, of all the developments of the last 25 years in the rubber industry, the plantation, with its assurance of perennial plenty, is far the greatest.

SOME GREETINGS ON OUR 25TH BIRTHDAY.

ON October last THE INDIA RUBBER WORLD completed its first quarter century. Twenty-five years of continuous publication at least shows vitality; and when it is accompanied by constant growth in size and in sphere of influence it betokens good health. An increase from 50 pages, the average number per issue during our first year, to 150 pages, the average number in each issue during the past year, is proof positive of sound conditions and good circulation.

There are comparatively few journals associated with any industry, either in this country or abroad, that have reached their twenty-fifth milestone, and fewer still that have continued for this length of time under the same editorial management. We cannot help feeling that the record of this publication has been quite creditable and have been greatly pleased that so many members of the rubber trade agree with us in this opinion. Several pages of this issue are devoted to letters of greeting and congratulation from friends—by some of whom this publication has received a monthly welcome since its first number. There is a noticeable unanimity in these tributes to the effect that this journal has always been absolutely independent and continuously helpful to the trade. We have been rather disposed to pride ourselves on these two qualities. An industrial publication that is not independent and helpful certainly has no excuse for being.

THE INDIA RUBBER WORLD has sought not only to be helpful in the way of chronicling all news of interest to the trade, describing promptly and fully all important inventions, new processes and discoveries, but—a matter of far greater importance—it has sought so to interpret present events as to show the probabilities of the future and thus to help its readers to shape their course with a view to coming conditions. This has been particularly true of its attitude toward rubber plantations, the desirability of which—in fact the inevitable necessity for which—it has preached constantly almost from its first number, although for several years its preaching fell on deaf ears. During the last decade, however, it has had the profound satisfaction of seeing the leading American manufacturers take a substantial interest in this great field of rubber enterprise. This is only one instance in which this journal has worked unremittingly for the welfare of the whole rubber trade, at home and abroad.

With a constantly increasing staff; with correspondents in all of the world's rubber centers, and with the wish to be of still greater service to the trade in the future, we enter upon the second quarter century.

A RUBBER REPRESENTATIVE IN LONDON.

THE decision of the Rubber Club of America to have representation in London at the present time is of especial interest. Mr. Betram G. Work, President of The B. F. Goodrich Co., who sailed for England December 30 on the "Lusitania," is just the man for the place. He is as familiar with European rubber conditions as he is with American. He is personally friendly with the leaders of the rubber trade over there. His company has large interests in England and a factory in France. Moreover, he is eminently fair, forceful and sagacious.

AMERICAN MANUFACTURERS AND THE WAR.

WHEN we get plenty of rubber, which we are bound to do in time, the trade should prosper because of the war. The home market for shoes, clothing, rubber sundries, etc., will not be affected noticeably. With big crops, agricultural rubber goods, as elevator belts, will be needed. Railroad equipment will also be in demand. Special goods such as footwear, ground sheets and sundries for the belligerents will find a good market. The tire business, truck and motor, should show a constant increase.

On the other hand, the embargo, by raising the price of rubber here, has caused a loss of millions of dollars, particularly for those who had to fill contracts.

It will therefore be some time before the American manufacturer is anything but a loser by the war.

IN 1913 ENGLAND, FRANCE AND RUSSIA USED 38,000 tons of rubber. Today, with many of their factories working night and day on army and navy orders and using government specifications that call for high grade goods, they are using more rubber than ever before.

On December 1 they had in sight 9,500 tons of rubber of all kinds. That would mean about three months' supply for the Allies. It is likely that the British Government, to be on the safe side, would consider that a six months supply must be in sight before they would be safe. With much of the plantation rubber and all of the Africans coming to London, it will be probably February 1 before a surplus, say of 20,000 tons, accumulates.

WHAT, WITH THE NEWS SUPPRESSED OR CENSORED for military reasons, do we actually know of the war's progress? Take the latest Suez Canal rumor for example:

"A strong force of Turks led by German officers appeared at (place marked out by censor). They succeeded in getting possession of a strip of the canal some ten miles in length. This they took up and removed on camels to (name blotted out). It is supposed that they have cut it into ten-foot sections and will ship it to (name deleted) to use as trenches for their troops."

With censorship of this sort how can we know whether or not rubber from the Far East will still come along?

The Rubber Industry of Germany.

THE peculiar position of Germany today hemmed in by enemies on almost every side and shut off from nearly all of those parts of the world with which commerce has hitherto been carried on makes that country particularly interesting at the present time.

TYPE OF MODERN GERMAN RUBBER FACTORY.

Though many people in the rubber trade may have had rather a hazy idea of Germany's position in the industry of the world, it probably will surprise no one to know that for many years previous to the outbreak of this unhappy war Germany had stood second to the United States in the extent of its rubber manufacture. In the matter of rubber exports it led the United States almost three to one, the German exports of rubber manufactured goods last year amounting to \$32,000,000, while those from the United States amounted to only a little over \$12,000,000. In the early part of the present year Germany could count 600 rubber manufacturing plants, of which number 150 were companies of large size and importance in the trade. These

The first rubber factory was started in Germany in 1829, near Berlin. This was just about the time that the first attempts were being made in this country to utilize the product of the South American rubber forests. The first German factory was devoted to the manufacture of rubber thread and elastic fabrics, but, as Goodyear's vulcanization process had not then been discovered, the success of this early venture was probably no more marked than was the case in the various factories that sprung up in New England from 1830 to 1840.

Rubber footwear was first made in Germany in 1850, in a factory built at Mannheim, by the Etablissement Hutchinson, of Paris, which, in turn, by the way, was founded by Hiram Hutchinson, an American. In the same year the manufacture of insulated cables was started, a line in which Germany has been pre-eminently successful, the cable works in that country being for many years past the largest in the world. In 1856 the first German factory for the manufacture of hard rubber was started, being devoted to the making

of combs by a process secured from Conrad Poppenhusen, of the India Rubber Comb Co. of New York.

But just as the growth of the rubber industry in the United States was very slow up to the time of the Civil War, similarly, rubber manufacture developed slowly in Germany until the Franco-Prussian War, after which, in company with every other German industry, it advanced with marked rapidity.

Before 1880, German rubber manufacturers confined themselves almost exclusively to mechanical and surgical goods, druggists' sundries, footwear and garments, but with the advent of the pneumatic tire for bicycles, in the 80's, tire making was introduced into a number of the German factories, and with the

ONE OF THE GREAT GERMAN SUBMARINE CABLE WORKS, WITH CABLE STEAMER IN FOREGROUND.

plants gave occupation to over 40,000 workmen and were annually turning out manufactured goods to the value of about \$80,000,000.

The growth of the rubber industry in Germany has practically paralleled the development of the industry in the United States.

appearance of the automobile this industry in Germany began to grow with tremendous rapidity, until it consumed nearly one-half of the crude rubber used in German factories. Last year the tire product of that country amounted to \$38,000,000 in value, of which tires to the value of \$14,000,000 were exported.

England taking about one-fourth, France nearly as much, the remainder being shipped all over the world. Another addition to the list of rubber manufactures, which took place about thirty years ago, was the making of toys, in which German manu-

SPREADER ROOM FOR BALLOON FABRIC.

facturers also became very proficient, a sufficient proof of which has been the prevalence of German-made rubber toys in the American market during the last half dozen years.

The development of German manufacturing can be seen at a glance from the following brief table, which shows the number of factories at different periods during the last fifty years and the number of employees connected with these factories.

These figures embrace all lines of rubber manufacture where crude rubber is washed, mixed and prepared in the factory in which the goods are finished. Tire repair shops are not included:

	Number of Factories.	Persons Employed.
1861	36	1,788
1875	120	5,635
1882	243	7,666
1895	450	13,114
1907	539	31,909
1914	600	40,000

Another gage of the growth of the rubber industry in Germany is found in the notable increase in the imports of crude rubber into that country. In 1889 they amounted to 4,000 tons; ten years later nearly 14,000 tons; in 1909, a little over 27,000 tons, and in 1913 about 29,000 tons. To be sure, not all of this rubber was retained by the German manufacturers, from one-quarter to one-third of it being exported in this crude condition, the exports in 1889 equaling 700 tons; in 1899, over 5,000 tons; in 1909, 9,000 tons, and in 1913, 10,000 tons. This left for German consumption at the three periods, 1889, 1899 and 1909, something over 3,000, 8,000 and 18,000 tons, respectively, while in 1913 the rubber used by German manufacturers was 19,000 tons. Perhaps the most interesting statistical phase of the German rubber industry lies in the increase in exports of its manufactured goods. German rubber goods exports in 1889 were valued at about \$5,800,000; in 1899 at \$13,000,000; in 1909 at \$14,000,000, and in 1913 at \$32,000,000.

The Germans have been particularly successful in the discovery and use of rubber substitutes. They have also led the world in their long continued and systematic search for syn-

thetic rubber. It will undoubtedly be remembered that Dr. Duisberg, Director General of the Farbenfabriken, of Elberfeld, read a most interesting paper on synthetic rubber at the International Congress of Applied Chemistry, held in New York in September, 1912. He displayed at that time a set of tires made of this artificial product, another set having been made and presented to the Kaiser. Dr. Duisberg and his co-laborers, Drs. Fritz Hofmann and Carl Harries, are celebrated among chemists for the work they have been doing for a number of years past on the absorbing problem of synthetic rubber.

In a general way it may be said that during the last few decades rubber manufacture in Germany has been a highly progressive and successful department of German industry. It received that same scientific, painstaking, systematic attention that Germans have devoted to every industrial and commercial branch. Unlike American or British, German manufacturers have received a great amount of the most valuable help from the universities and technical schools. In other words, the government helped in every way possible.

Of the 600 companies, large and small, engaged in various kinds of rubber manufacture, there were at the beginning of this year about 10 important companies making tires, nearly the same number engaged in the production of rubber footwear, at least 20 large companies making cables—and probably 15 important manufacturers of rubber machinery, among them the famous house of Krupp. There are quite a number of rubber manufacturing companies in Germany that have been established over 50 years, and a long list which have been in business over a third of a century; and some of these companies are of a magnitude that would compare favorably with the large rubber manufacturing corporations of the United States. For instance, there is the Continental India Rubber & Gutta Percha Co., Hannover, which normally employs 7,000 workmen; the

MAKING GAS BAGS FOR WAR BALLOONS.

Vereinigte Harburg-Wien Gummiwarenfabriken, the Vienna factory employing 4,500 people, and the Harburg 2,500 workmen. The total capitalization of the German rubber industry at the beginning of this year was \$25,000,000, and it might be safely said that this capitalization was conservative. The industry undoubtedly had a working capital of twice that sum, while its annual output of finished goods was from three to four times its capitalization.

The enterprising and courteous founders and heads of the great German rubber factories are men known the world over—Seligman, Prinzhorn and Dr. Gerlach of the Continental; Hoff of the Harburg-Wein; Clouth of Cologne-Nippes; Calmon of Hamburg; Spannagel of Berlin; Sierke of the Gummi-Kamm; not to forget the scholarly Dr. Traut, and many others.

The German accomplishments in hard rubber have been wonderful. This is true not only in the production of technical articles that have found a market all over the world, but in the most difficult art work. For example, there is the beautiful 6 foot statue of Arminius, prince of the Cherusci, after his victory over the Roman legions under Varus. This statue was modeled by Engelhard, of Hannover, molded in hard rubber, in one piece, at the Traut factory at Hamburg.

In addition to the importation and manufacture of rubber, Germany has taken a deep interest in developing rubber producing sources in its various protectorates, namely—German East Africa, German Southeast Africa, Cameroon and Togo. The receipts of rubber from these four foreign possessions have quite steadily increased during the last eight years. In 1908 they equaled 1,341 tons; the following year 1,645 tons; in 1910 2,566 tons, and in 1913, 4,000 tons.

To be sure, last year rubber manufacturing in Germany, in common with the industry elsewhere, suffered something of a recession in its output and its profits, owing to the general conditions that obtained all over the commercial world. But had it not been for the war, that situation would undoubtedly have been but temporary. With the breaking out of hostilities, however, the German industry received a staggering blow. Under the circumstances it is naturally difficult to get detailed information as to industrial conditions in the Kaiser's empire. Not only is every news channel officially guarded, but private letters received from German manufacturers seek to convey such an impression of fairly normal and healthful conditions that one cannot help feeling that patriotism supplies a color to the picture that accuracy would not warrant.

Enough information, however, that has come through the barriers that surround that Em-

STATUE OF ARMINIUS, MADE OF HARD RUBBER.

pire to show that, as one would naturally expect, the only rubber factories running on full time and with large orders ahead are those working for the military equipment of the German army, making tires for the army autos., balloon fabrics, cables, footwear and clothing for the soldiers, rubber sheets which they may interpose between themselves and the damp ground when they lie down at night, and other necessary kinds of equipment for the men in the field. Naturally, the consumption of rubber goods by those not engaged at the front has fallen off tremendously. The manufacture of what might be termed the unnecessary—that is, sporting goods, balls, toys, and all articles coming under the general classification of luxuries—has been stopped absolutely. The sale of tires has practically been taken over by the government. Private users are not permitted to purchase any tires which are good enough for military use. In fact the whole rubber manufacture of Germany is under government supervision, and the chemists and workmen necessary to carry out the government orders in rubber factories have, wherever possible, been exempt from military duty. But in other factories, whose output is not so essential for the operations at the front, the roster of workmen has been, of course, greatly depleted, so that inadequacy of help and extreme difficulty in securing transportation are two of the many burdens that the German rubber trade has to bear.

But the one paramount question with the German rubber mills is not so much a market for their finished goods as a supply of the crude material. It is not likely that Germany had stored away any large supply of crude rubber. That is shown by the fact that over one-third of the crude rubber imported into Germany in 1913 was exported during the year. The probability is that the supply in stock on the first of August was

not greatly in excess of the supply a year ago. While the Kaiser's military experts no doubt believed that a war was on its way, they confidently expected that it would be a short war and soon over, and therefore did not think it necessary to make provision against any long suspension of commercial communications. To be sure, some crude rubber has found its way into Germany via Holland and Sweden

SUNDRIES' DEPARTMENT IN GERMAN RUBBER FACTORY.

in the north and Italy and Switzerland in the south, but the amounts received through these channels must necessarily have been small and are likely to be discontinued altogether. The latest quotations on crude rubber in Germany show that it is selling for over twice its price in London and New York markets. If the war should continue another year, with conditions as they are at present, the Allies having a fairly free sweep of the seas, the German manufacturers would certainly be in a sad quandary over the matter of supplies. Many of the factories, as a matter of fact, have already been closed.

But even if the war were to stop tomorrow, the loss to the German rubber industry would be enormous. Granted that the

PACKING DEPARTMENT IN A GERMAN FACTORY

manufacturers of that country could quickly recover their former markets in South America and other neutral countries, it must be remembered that their largest customers were their near neighbors; and it is hardly likely that the people of England, France and Belgium will look with any favor on goods stamped "Made in Germany" for many years to come.

This story of the rubber situation in Germany would hardly be complete without referring to the courage with which the German manufacturers have borne their losses and the generosity that they have displayed toward their workmen. Practically all the large companies are supporting the families dependent upon employes who have gone to the front—and this notwithstanding the large and continuous drain upon their resources.

THE AMERICAN RUBBER INDUSTRY PARALYZED.

A paragraph in a recent German paper, speaking of the embargo on exports of rubber from all English ports and its effect upon the United States, remarks that the American rubber industry is paralyzed. Which is another proof that one is obliged often to go far from home to get the news.

The American Association of Commerce and Trade in Berlin, organized in 1903, with offices at Friederich Strasse 59-60, by American citizens engaged in business in Berlin, to foster commercial relations between the two countries, is issuing weekly reports on general conditions in Germany during the present crisis. A report just received contains an item to the effect that the secretary of the association, Professor George S. Atwood, was at the time of publication—November 12—in the United States, and that he would be pleased to receive and answer any inquiries directed to him in care of the National City Bank.

RUBBER AT THE SAFETY SHOW.

AT the International Exposition of Safety and Sanitation, held at the Grand Central Palace, New York, during December, rubber was more or less in evidence, and in some exhibits quite important.

The most spectacular part of the show was the demonstration of the efficacy of the "Lungmotor." This is a double cylinder arrangement, designed to assist those who for any reason whatever have ceased to breathe. It has an equipment of rubber tubes and rubber mouthpiece, which would place it in the category of rubber appliances. The spectacular part of it was when a young lady professional swimmer exhibited its use in a large tank full of water.

Very many of the exhibits showed as incidentals old and new types of hose. The B. F. Sturtevant Co., Boston, exhibited a vacuum cleaner, with many lengths of ordinary vacuum hose; the Pullman Co. exhibited a huge vacuum cleaner with correspondingly large hose for cleaning "Pullman" cars; the West Disinfecting Co. showed their protector equipped with special hose for sterilizing passenger car water coolers; while the New York Edison Co. showed 4-inch, wire-wound hose, connected with a special blower for ventilating gas-containing manholes. Speaking of the Edison company, aside from the insulated wire they use for their hundred and one devices, they exhibited huge rubber sleeves for overhead line protectors, insulated platforms for use in manholes, special linemen's rubber gloves, insulated screw-drivers, etc., etc. Quite in their line was the projector of The Precision Machine Co., Inc., New York, which is electrical and uses much insulated wire.

Something that makers of rubber diving suits may look upon with doubt is the aluminum diving armor of the Submarine Diving & Recovering Co., New York. While this may do away with a certain amount of rubber it still needs air hose, insulated wire for the diver's telephone, etc.

Speaking of armors leads one up to the "Nasdeo" breathing helmet, which enables a man to walk in the smokiest conflagration and breathe pure air from the feed hose that drags on the ground behind him. In this connection it is proper to mention the exhibit of Covers rubber respirators, which in a measure serve the same purpose.

There was a variety of novelties shown in the line of special sundries, such as the vibrator of The Stevens Invention Co., vacuum massage brushes and rolls, the Stevens pocket vaporizer and chemists' rubber goggles of the Willson style. The Life Extension Institute, Inc., showed a great variety of therapeutical instruments in rubber, glass and steel. There was also the Emil Greiner Co.'s apparatus for the analysis of mine gases, which employs rubber tubing and rubber gas bags.

In up-to-date novelties there was the Lightning vehicle washer, with its rubber protected sponge and length of hose; the American Washing Co.'s washer, with its rubber cylinders and their suction cells; the Morrison foot suction grip ladders, made of high grade red rubber; the Angell elevator safety lock, rubber padded at each end.

In the line of automobiles was the "Telescopic" fender from Cleveland, and the Elastic Safety Buffer of New York—both rubber in part.

Of interest also to the rubber men was the "Clipper" belt lacer, and a ladle for those who make soft metal molds shown by the Western Electric & Manufacturing Co., East Pittsburgh, Pennsylvania. This ladle is so arranged that no matter how full it is it always pours from the bottom.

The Bristol Co., Waterbury, Connecticut, among other things, showed their patented safety set screws and incidentally advertised the fact that companies like the Rubber Regenerating Co., Goodyear's Metallic Rubber Shoe Co., John A. Roehling's Sons Co. and other rubber men were users of them.

What Rubber Manufacturers Want in Crude Rubber.

By The Editor.

[Suggestions to Rubber Growers, for Guidance When the Embargo is Lifted.]

IN the first place, they want rubber, plenty of it, all the time. They want it at a fair price, the same price that their neighbors pay. They desire clean rubber, but can use dirty rubber at a price that will pay them to clean it.

There are certain rubber manufacturers who are always in the market for new types of wild rubber as well as for grades that only appear in small lots and at infrequent intervals. This is not because these grades are better than those that are standard, but, being untried, are viewed with doubt and have not a ready market; hence, those who can use them get such rubber at low prices. Certain grades of rubber that are standard also become scarce for a time, or are in such demand that the price becomes relatively high. Manufacturers then substitute other grades, or they mix two or more in different grades and get by the amalgamation a product equal to a higher grade. Such substitution and amalgamation, however, is the result of conditions and is not sought for. In the long run the great variety of grades, with their wide variations in cleanliness, wetness, texture, physical shape, resin contents, etc., is a distinct disadvantage and a bar to efficiency.

One needs only to glance back over the rubber market of the past ten years to note that there have been from 50 to 60 grades of Brazilian, 20 to 30 of Central and 50 to 60 African brands constantly available; and in addition a half hundred bastard rubbers that were used in times of high prices.

If there were only one grade of rubber, standardized as to quality and price, it would be better than the present heterogeneous jumble of grades. That, however, is not likely to come to pass.

The change in grades that will occur will be the gradual disappearance from the market of the resinous, dirty, cheap rubbers. The high grades of wild rubber, together with plantation rubber, will possess the market. There will come also a new nomenclature, and the somewhat picturesque names that now exist, that are arbitrary and non-descriptive, will be superseded by names that are not only descriptive but that are a warrant of quality. Until some general super-excellent rubber is produced in such quantities that it dominates the market, it would be of great assistance to manufacturers if large producers of plantation rubber would adopt brands and protect them as trade marks. And even then there is bound to be imitation, with the intent to deceive. For example, if Highlands and Lowlands were grades eagerly sought by the manufacturers, some imitator is sure to brand his rubber "Hi Lands" and "Lo Lands."

That the rubber manufacturers desire clean rubber cannot be for a moment doubted. The fact that they have in the past been forced to install great washing plants to remove bark, sand and a variety of deleterious substances, and that they still use such machinery, does not argue that they would not be glad to receive all kinds of rubber so clean that factory washing would be superfluous. The cost of washing has in the past added at least $1\frac{1}{2}$ cent a pound to the price of the rubber used by them. Taking all wild rubber, including bastard gums, at 200,000,000 pounds, the cost to them would be \$1,000,000 annually. Then there is the shrinkage from moisture and dirt, much of the cost of which often falls upon the manufacturer. Beyond this is the freight charge on the water and dirt, which, at the high rates that have heretofore obtained from the African and Amazonian sources of supply, is

a great annual loss to the rubber trade. The trade would, therefore, welcome the abatement of these unnecessary charges, an abatement that plantation rubber has already begun to put in force.

The shrinkage of wild rubber has been and still is a burden, a reminder of industrial slovenliness and unthrift. It has profited, temporarily only, the rubber gatherer and rubber seller. In the long run it has proved costly—to the rubber manufacturer most of all. The first cost to the manufacturer is in the purchase for rubber that which is not rubber. The second cost, the most serious, is the presence of bits of deleterious material which the washing does not wholly remove and which in the finished goods often produce flaws that render them unmarketable. Thus a sliver of wood bedded in a sheet of rubber may pass through washers, mixers, calenders, vulcanizers and be just under the surface in a finished rubber coat. Then, when in use, it breaks through the surface, opening an ugly scar, and the coat is returned, a total loss to the maker. So, too, with grains of sand that finally show in a pitted, porous surface.

They, therefore, want a better rubber than has yet been produced. Today the best rubber in the world is Upriver fine. It is, at its best, a splendid rubber. Little by little plantation *Hevea* is approaching it in excellence. If there is anything in selection, in the application of science to rubber problems, plantation rubber should not only equal Upriver fine in every respect but should eventually so far surpass it as to establish a new standard of excellence.

Rubber producers, particularly from cultivated trees, are ever striving to put on the market gum that is as light colored as may be. Indeed successful efforts have been made to secure a product that is almost white. As the great majority of finished rubber goods are black—the result of sulphur mixing and vulcanization by heat—color or lack of it is of very little interest to rubber manufacturers. A jet black, clean, nervy rubber will command just as good a price as a straw colored or a white rubber.

Of the hundreds of rubber manufacturers in the world only a small percentage are financially interested in rubber plantations. Their attitude is that the production of finished rubber goods is enough to engross their energies and capital. They are perfectly satisfied to leave the production of the crude material to those who specialize in it.

In the process of manufacture, rubber is first washed, then dried and then massed—the last to render it homogeneous and ready to take up the sulphur, metallic oxides and the like that go to make up the compound. Plantation rubber will eventually render washing and drying unnecessary, for clean, dry rubber will be produced. It is possible, too, that so homogeneous a product will be evolved that massing will also be unnecessary. The last word upon ideal coagulation has not by any means been said. How latex is coagulated—whether by acetic acid or smoke—does not interest the user of the rubber. His interest lies in the cleanliness, nerve and uniformity of the product.

That plantation rubber will evolve a variety of new grades for a time is probable. It is also likely that varying methods of compounding and vulcanizing on the part of manufacturers—all of whom have their own processes—will serve to bring out many qualities in special grades that may be of more or less general importance. But that certain grades of plantation rubbers will always continue to be selected, some for

rubber cements, others for hard rubber, still others for insulation, and so on, is hardly likely. The general qualities called for are resilience, impermeability and toughness. For example: In motor tires impermeability and toughness are necessary; in clothing, impermeability and plasticity; in wire covering, the same; but in rubber thread, elastic bands and goods of that type, elasticity is also required. An extremely resilient crude rubber is just as adaptable for goods that call for only plasticity and impermeability, and some time in the future such a standard high grade will be evolved and used for all of the varied lines that now comprise rubber manufacture.

Efforts to corner rubber, such as that attempted by Vianna in 1882 and others a few years later, are not viewed by rubber manufacturers with the slightest degree of tolerance. They have in the past, fortunately, resulted in failure on the part of the speculators and, as a whole, meant loss to the rubber trade. So, too, fluctuations in price, whether from speculative or natural cause, have proved a distinct handicap. If crude rubber be very high manufacturers find it difficult to get increased prices for their goods. Many articles in rubber if too high priced are displaced by others that contain no rubber. For example, leather belting takes the place of rubber belting, twine is used instead of elastic bands, etc., etc. In the event of a sudden drop in price of crude rubber, orders placed by wholesale dealers are cancelled and new orders placed at a lower price with other manufacturers. Hence, corners and fluctuations in price are feared by the rubber manufacturing trade at large, and are a serious drawback to a regular and healthy growth.

That rubber manufacturers will view possible efforts of rubber planters to curtail production and thus maintain high prices with favor can be denied. Such action may keep prices up for a time, but it will inevitably stimulate outside planting in all parts of the tropical world. It will also be a distinct advantage to those who have partially established plantations in localities not blessed with cheap labor. Further than this, it will be a constant incentive to those distinguished and scholarly German chemists who are step by step advancing toward the commercial production of synthetic rubber.

The rubber manufacturer produces his quota of goods whether the price of Fine Para be \$1 or \$3 a pound. Really what most concerns him is that the price be the same to all and that violent fluctuations in price be done away with.

For a product so valuable, india rubber has suffered from careless and inadequate packing more than any other commodity. In the past, rubber worth anywhere from \$1 to \$2 a pound, and even more, has been sent thousands of miles in rough boxes, in fragile crates, in burlap bags. It has been stored where it came in contact with water, oil, heated air and dirt in infinite variety. So loosely packed was it and so carelessly guarded that its theft was of daily occurrence. An urgent necessity, therefore, is some form of packing that shall at once be secure, cleanly and economical.

In considering this, however, there comes the important question of the physical shape of the rubber to be packed. Shall it be in the form of balls or pelles, sheets, slabs, sausages or what? Wild rubber has come in all of these shapes, and more. Is there any reason for accepting any one of these forms as embodying the best ideas? They all have their advocates, but they are without exception those who gather it in the jungle and who find it most convenient to make the shapes in which they send their rubber.

The pelle is not capable of being packed without waste. It holds moisture a long time and it must be soaked in hot water and cut open before the machines can handle it. Small balls and sausages gather much dirt, leave much of their surface open to oxidization and are easily stolen. Sheets like the crepe of commerce have all to be pulled apart before

use, and a pound or two torn from one end is not missed. It would seem, therefore, that some form having always standard dimensions, and branded with the name of the plantation, would be a step in advance. Rubber in such form would be hard to steal, or hard to dispose of when stolen, would pack without waste of space and would be exceedingly easy to handle in weighing. As for the wooden boxes, planed boards should be always used. Of course the ideal shipping package would be one built of material produced near the plantation, something that could be used or sold after it was emptied. That, however, is yet to be evolved.

The theft of rubber is common. In the past, rubber gatherers, importers and manufacturers have all been sufferers. On the part of manufacturers many attempts have been made to bring the thieves to justice, but the difficulty in establishing title to pelles and chunks that are hardly distinguishable one from the other has usually resulted in failure. With uniform shape, plantation brands, adequate packing and direct shipment from plantation to factory, most of this thieving would be impossible, or at least easily detected. Once in the factory, the manufacturer is able to guard his rubber pretty safely. There is a movement, inaugurated by the Rubber Club of America, to destroy the market for stolen rubber by invoking the assistance of manufacturers and the wholesale handlers of rubber waste. These firms not only refuse to handle lots of rubber offered by those who cannot show a clear title to the goods, but they also report any such offerings to the Rubber Club. Such procedure will in time, no doubt, reduce rubber stealing to a minimum. Perhaps it is the rubber planter who will in the next decade suffer most from rubber thieves. Certain it is that if once the thrifty peasants of the Middle East ever establish every man his own little plantation of *Hevea*, some of his richer neighbors' rubber will be likely to swell the product of his own trees.

The middle man, the importer, has in the past played a very important part in crude rubber. He has provided capital for many factories and financed aviators and producers the world over. His operations have been large and his profits commensurate. As in other lines, it is probable that he will always have a place. With the growth of the plantation industry, the standardization of grades and the close relations between producer and user, his activities, however, are likely to be lessened. Rubber importing as a definite commission business will take the place of speculative importing, juggling of grades and creation of new types from ingenious rearrangement of old. Nor is it likely that rubber manufacturers will long continue to pay commissions to those who receive rubber simply to re-pack and re-ship it to them. Still further they will view with distinct relief the abandonment of the ancient storage vaults that reek with moisture.

A simple form of contract that will be universal and fair to both buyer and seller is something that the majority of rubber manufacturers most earnestly desire. In the past there have been a variety of contracts that were sometimes binding and sometimes not. There have not been wanting instances when importers sold for forward delivery at a price, and if the market went down rushed deliveries ahead of time and in increased amounts, or when it went up delayed deliveries for months, substituted poorer sorts to gain time or refused to fill orders at all. On the other hand, there have been times when manufacturers buying at high prices, and experiencing a falling of prices, refused to take the rubber contracted for. Of course, a steady market price, which plantation rubber will in time effect, will do away with such temptation to a degree; and a uniform, clear contract will do the rest.

Speaking of the attitude of American rubber manufacturers toward plantation rubber, they are very friendly, but at the same time are constantly provoked by the mixed shipments

and the unreliable naming of grades. It would be possible to fill pages with protests, and just ones. A sample from one of the large and alert manufacturers will suffice.

"The ridiculousness of the present method of grading this rubber is a thing that I cannot understand. Of a five-ton delivery of so-called First Latex from ——— to this company there were seven distinct varieties, all the way from the finest thin pale crepe up to heavy amber gristly sheet $1\frac{1}{2}$ inch thick. Apparently all this is decided by some wise man in the warehouse in London, who decides that this or that grade is or is not this or some other grade. All of which, in this enlightened age of scientific management and laboratories, strikes me as being a little more than particularly 'asinine.'"

Another point that is emphasized is the lack of nerve in some of the best looking rubber, said to be due to too much milling. Rubber manufacturers all know that the best crude rubber loses its nerve if massed too much. It is therefore presumed that too much milling in the plantation factory will bring about the same result.

RUBBER SHOE VARNISH.

By a Veteran Rubber Shoe Mill Superintendent

THE first recipe for rubber shoe varnish came into my possession fifty years ago. It was called the "Isaac Williams Varnish." It read: Boil oil till it becomes thick as molasses, add 14 ounces of sulphur to one gallon of oil and one and one half gallons of camphene. Here is another recipe from my book of that date: Two gallons oil, one pound sulphur, one ounce sugar lead and benzene.

From the same book came the following recipes for preparing coal tar: One gallon coal tar, 4 pounds sulphur, 4 pounds rosin; melt and mix. Another is: No. 1—10 gallons tar, 40 pounds sulphur; mix. No. 2—100 pounds rosin, melt and add 15 gallons benzene. To No. 1 add $4\frac{1}{2}$ gallons of No. 2.

Forty years ago some one showed me a small sample of what was said to be Russian varnish, and said if I could make varnish like it my fortune was made. A few years ago I was shown by a man who had worked in the Russian factory the way *he said* it was made; and while it differs in the compound, the varnish does not vary much from American varnish. Their way of vulcanizing, in which the shoe is taken from the heater in a tacky state, and allowed to dry one week before packing, is the secret.

A man named Story went from this country some 50 years ago and had much to do with starting the Liverpool Rubber Co., Liverpool, England, the North British Rubber Co., Edinburgh, and the Russian-American Co., Petrograd. Charles Hotchkiss was also with the Hutchinson Etablissement in France at the same time, and they probably used the same formulas in every factory.

For many years Charles Ensign, who came to the Goodyear Metallic Rubber Shoe Co. about 1859, and was superintendent until the fall of 1881, was the recognized authority on making varnish. Whether he improved the recipe that came to him I cannot say, but his formula was used by most American firms a few years ago. The following oils are used: Calcutta, Baltic, blown oil, Craig and Rose thick oil, and common linseed oil. The boiling varies as to time from 8 hours to 300 or more. I made varnish 4 years without boiling the oil. This takes longer but makes a more elastic varnish. The compounds used do not vary much from oil, sulphur and rosin, but I have found the following all used: Lime, shellac, gilsouite, sugar of lead, litharge, white lead and small quantities of commercial varnish.

Putting the compound into the kettle so that it comes in contact with the bottom is wrong; the proper way is to suspend it 3 or 4 inches from the bottom. When thinning use one gallon turpentine first, before putting in naphtha. This improves the varnish.

One way of making varnish is to keep out 3 gallons of oil, using only 7 gallons, and when the varnish rises toward the top of the kettle, add the 3 gallons of oil, which will cause it to settle. Then take from fire. Another way is to use a steam jacket kettle, putting in oil and compounds, and covering with turpentine. Still another is to take lime and rosin, melt and mix, cool and make into fine powder, after which add sulphur. The oil is made thick for this varnish. Another method calls for the use of blown oil. The rule is, the thicker the oil the less sulphur.

Different factories run different heats, from 5 to 11 hours, and varnish is made to suit. In many places a dryer is used, made by a well known varnish firm. In fact many use this varnish and dryer entirely. Most heaters are run to suit varnish rather than stock, and until heaters are constructed on right lines shoes in different parts of the heater will vary. The surface of upper stock has much to do with the appearance of varnish. If surface is hard it will crack and crawl. For some years I made up stock with billiard and thread scrap instead of new Pará, and the varnish seemed to have a firmer hold and to be less liable to crack.

For several years I made it a point to have samples of upper and soling of different grades of the day's running varnished and put in two sections of the heater every night. Next morning I tried the tensile strength, noted the adhesion of varnish, etc., also had small discs of same stock made under pressure. The specific gravity of these discs was taken every day and record kept, and once a week specific gravity was taken of all stock used in shoes. All stocks were run by weight, not by gage.

Many heaters are run as to time by taking out shoes and testing them when it is thought they are about vulcanized. This reminds me of a heater man 40 years ago. When the steam dry heater was put in place of the pot heater, this man ran it on same lines, taking strips of each kind of stock that was in the heater, which he hung inside about a foot from the small door. After the heat had been running some time he would take them out and test with thumb nail until he thought they were properly vulcanized; and while in charge of the heater he never used a thermometer as his sight was failing and he could not see it.

OPPORTUNITIES FOR MOTOR VEHICLES IN RUSSIA.

Practically all the automobiles, motor trucks and motorcycles in Russia having been requisitioned for military purposes, Consul F. Willoughby Smith, of Batum, calls attention to this fact, adding that the country will be obliged to readjust its centers of distribution and channels of trade, while seeking new sources from which to draw supplies. As soon as the danger of further requisitions has passed, there will necessarily be a great demand for all descriptions of motor vehicles, which are largely used in the oil fields and mines, as well as on farms and in manufacturing enterprises.

TIRES IN NETHERLAND EAST INDIES.

The principal automobile tires represented in Java at the close of 1913 included: American tires made by the Goodrich Tire Co.; British tires, made by the Dunlop Tire Co.; Michelin tires, made in France; the German Continental tire and the Prowodnik tire, made in Russia. East Java is the location of the Goodrich agency in that market. In 1913 the total imports into Dutch East India included tires for automobiles to the value of \$590,000 and for bicycles to the value of \$180,250; the American tires representing \$8,000 and \$720.

AMERICAN RUBBER SHOES IN SYRIA.

An American consul is authority for the statement that some years ago a considerable quantity of American rubber shoes was sold in Damascus, but the dealers ruined the trade by only bringing in the cheaper grades. All the rubber shoes worn in that section have in consequence been brought of late from Russia.

A Remarkable Salvage Operation Which Rubber Made Possible.

By Robert G. Skerrett.

THE submarine diver is able to follow his calling and to do the things that amaze, at times, mainly because of the vitally necessary part that india rubber plays in his equipment. There are about 400 commercial divers in the United States, but all of these men are not equal to really deep submergences, and the man that can go down 150 feet and there do good work is the exception rather than the rule. But aside from these men there are other under-water workers

GROUP OF MASTER DIVERS

of whom the public hears but little. These are the qualified divers in the navy, who are officially known as seamen gunners.

The seaman gunner is the all-around handy man or enlisted specialist of the battle fleet, and part of his comprehensive training is submarine diving. When he dons his diving dress he generally goes overboard to look for a lost torpedo, a stray anchor, or to examine the bottom of the ship on which he is serving. For this work the sailorman is not required to go to any considerable depth, therefore he qualifies at the training school at Newport by proving his fitness to operate at but 60 feet below the surface. Every fighting ship in the United States navy has a number of these men aboard, being in this respect like the battle craft of the British navy. The story we have to tell is how some divers of the English navy, from the cruiser "E-sex," with other of their citizen fellows from Canada and the United States, recently completed an exceedingly hazardous under-water task in connection with the sunken steamer "Empress of Ireland."

The reason the British naval divers took so important a part in this work was because the admiralty set the pace a few years ago in certain revolutionary experiments which showed how men properly trained and suitably equipped could descend to a depth of 200 feet and assist there in the recovery of sunken property. Prior to that, a good many divers had lost their lives by submergences at lesser depths, and among these were seamen in the royal navy. The medical men and physicists engaged in that investigation found out how the "bends," paralysis and sacrifices of life could be avoided while actually increasing the operative zone of the under-water worker. Following upon these disclosures some important improvements have been made in the elastic diving dress

as well as in the armored rubber air hose and the hand pumps employed in furnishing an ample supply of air to the diver at a suitable pressure—the latter always regulated by the distance below the surface of the water.

Before going into the details of the salvage of the "Empress of Ireland," a few paragraphs may properly be inserted here descriptive of the diver's equipment, to show how necessary a part of this equipment rubber constitutes.

A modern diving dress consists essentially of two parts—the bronze helmet and collar or corselet and the elastic body-covering, which is secured to it, extending from the shoulders to the feet. In dressing, the diver gets into his one-piece waterproof garment through the opening at the shoulders or neck, and this section of his dress is akin to one type of nightdrawers for children. The only openings are at the neck and the cuffs, the feet being covered by an integral part of the dress. It is in this portion of the so-called submarine armor that rubber plays so conspicuous a part. This garment of the diver is made of solid sheet india rubber, between two layers of tanned twill. It has an inner and an outer collar, the inner one (sometimes called the "bib") of the same material as that of the dress, to pull up round the neck, and the outer one, of india rubber, to go over the breast plate or corselet to form a water-tight joint. The cuffs are also of rubber and fit tightly round the wrists, making, when secured by the rubber rings, a water-tight joint, at the same time leaving the diver's hands free.

The rings for the wrists go over the rubber cuffs, and two or more of them may be required, depending upon the conditions under which the man is working. Now, of course, a

PAIR OF DIVERS AT WORK

diver could not work without air being sent down to him from the surface, and armored rubber hose is the means by which this vital current is forced down to him through the agency of suitable pumps or tanks charged with a supply of compressed air. As has been said by one of the world's largest manufacturers of diving equipment: "It is of the utmost importance that the diver's air pipe should be of the strongest and best description, and we do not hesitate to assert from our long experience that hose of less than 5-ply should never be used for deep-water work. Our hose is made from the best possible materials, and before it is allowed to leave our works every length is tested to a pressure of 300 pounds per

square inch and must show no sign of increase of diameter whilst under that pressure. All our hose is armored by a spiral support of tinned steel wire embedded in the texture."

The helmet is screwed down upon the corselet and made tight by a rubber gasket, and the face plate is sealed in the same fashion by a suitable ring of rubber. Of course this does not cover what might be called the additional features of a diver's costume, which include stout leather boots, with wooden soles, to which are riveted lead soles; leaden weights upon his back and chest to carry him to the bottom notwithstanding the air inside of his suit; the telephone equipment inside of his helmet; his lifeline, which has in its core the telephone circuit; the india rubber mittens which he may have to wear when the water is very cold; his submarine lamp; shoulder pad to take the pressure of the heavy metal head dress, and the belt and sheath in which the under-water worker carries his knife and possibly additional lead weights to hold him more firmly upon the bottom against the sweep of a strong current.

Should a diver fall so that his body be prone or his head lower than his waist, there is danger that the air may flow from the helmet into the elastic dress and inflate it. In deep water the rubber suiting is pressed very snugly against the diver's body by the surrounding water and very little air remains there. When he loses his balance, however, this state of affairs might be changed, to his peril, his suit become distended, and the diver floated hastily surfaceward, with the possible chance of the dress bursting and the man being drowned or otherwise menaced by the sudden lessening of the water pressure on his way upward. Therefore, the very latest improvement in diving dresses is one that permits the lacing up of the legs so that the suit is held always close to the body and cannot be filled with buoyant air even though the diver fall. This gives him much greater freedom of action. He can bend over or stoop, or even crawl along the bottom, if his work require, and he need not fear the inflating and dangerous expansion of his covering.

It would be hard to tell just how many submarine divers there are in other parts of the world, but their employment is very extensive. In the northern waters of Europe their services are principally for salvage operations and subaqueous engineering tasks; and these demands are many. In the Mediterranean and in the warm waters of the Southern Pacific and the Indian Ocean, sponge gatherers and pearl hunters use diving suits such as we have described, in great numbers, and the Japanese shell hunters in their native waters and in southern California do the same thing. Therefore, it may be reasonably declared that thousands of submarine diving suits are in use, and the manufacturing industry is a large and very profitable one. This is particularly so in England and Germany.

A diving suit, like any other character of dress, has a long or short life, depending upon the nature of the jobs. The average dress is good for two or three years if carefully handled and the demands are not rugged. However, the elastic part of the suit may survive only a few days' or a few hours' stress. In cutting the big hole through the hull of the "Empress of Ireland," described later, the long spiral steel shavings that were made by the drills were particularly harmful to the rubber canvas legs of the suits and, despite the use of protecting knee-pads, the tough fabric of rubber and oak-tanned twill was soon pierced. Of course these holes can be patched, but no experienced diver wants to use the dress again for his deeper submergences.

As most of us know, the "Empress of Ireland" was damaged by collision with another ship and went to the bottom near the mouth of the St. Lawrence river. At that point the river rises and falls at each tide to a normal measure of 16 feet, but under some conditions this change of depth is even

greater. As a result, the currents are very swift when the tide is either ebbing or on the flood, and at each change of tide there is a brief period, of only about thirty minutes, called the "slack," when the waters are substantially currentless or still. Salvage operations could be carried on only for these short periods, and even then the state of the weather determined whether or not work could be done at all below the surface. But there were other circumstances that hampered. The river at the point of the catastrophe is very deep; the waters near the bottom are muddy and well-nigh inky black, while the temperature was as low as 40 degrees Fahrenheit. These conditions made the divers' tasks not only difficult but extremely dangerous. However, india rubber, combined with engineering cunning, won out just the same.

When the "Empress of Ireland" went to the bottom after

DRYING THE DIVER'S DRESS

her collision with the "Storstad," she heeled over and rested on her wounded side. There was nothing above the surface to indicate how the ship lay in relation to the course of the river, nor, indeed, anything to show exactly where she rested. The initial task of the Canadian Salvage Association was to find out just where the ship was, and her exact position. This was not easy. The diver who first went down just managed to catch a projection on the craft's upturned bilge, and then, losing his hold, dropped to nearly 130 feet, where he hung without being able to touch anything. The red paint which discolored his suit told that he had touched the ship's bottom, and his description of the projection to which he had clung revealed its identity as one of the bilge keels. That, however, was only one point of contact, and the next time the diver went down he landed on the hull, just inside of the rail. After that, successive descents enabled the salvors to make certain of the vessel's position.

The Canadian government wished to secure the mail matter; certain underwriters wanted to get the silver bullion and specie, and the liner's owners, the Canadian Pacific Railway, were especially anxious to recover the bodies of the

TWO DIVING OUTFITS, WITH CABLES, HOSE, ETC.

passengers. The postal pouches, the treasure and most of the bodies were inside of the ill-fated steamer. It is an extremely hazardous thing to enter a sunken ship, especially if she is in deep and dark waters, but the problem was made still harder before the salvors could begin. The cargo shifted, and this tended to bring the ship back towards an upright position, but still left her heeled over at a sharp angle, while the soft mud of the river bottom yielded and the liner sank deeply into it.

The diagram accompanying this article shows the path the divers took in reaching the ship's interior. The steerage was on the same deck with the mail room and strong room—the latter containing the bullion and the purser's safe. It was out of the question to reach the strong room by any of the regular hatchways or other hull openings, but the salvors found another route available, provided the side-plating of the ship could be cut through at a certain point—that point having no outward mark other than that of an air port, and that air port merely one among scores of others. To find this particular air port it was necessary for the divers to work from both ends toward the center and to count carefully each glazed opening until they had identified the desired deadlight. This was a difficult job, because they had to keep their footing on the slippery slanting side of the liner. Finally, after some days of groping, they reached their goal. They got into the sunken vessel by the hole which they cut at a point where the internal arrangement of the craft made it fairly easy to reach the liner's strong room. The opening was made by drilling a lot of holes with a pneumatic tool fed with compressed air through an armored rubber hose reaching to the surface, and despite the fact that the divers had an awkward place to stand on the slanting side of the vessel, still the drill did its work so well that the passage was cut nearly as quickly down in that inky depth as could ordinarily be done in the open air. Of course they did not do this blindly, having submarine lamps to help them. From the first, the question of lights in that perilous work was one of great importance, but it was particularly desirable that the electric lamp should not require a cable which might get tangled. An electric hand lamp was adopted, but it was necessary to adapt it for the special conditions. Accordingly, the lamp was made water-tight by a piece of motorcycle tire, closed at one end by rubber cement and slipped over the lamp. The

end not sealed hugged the glass, and with the aid of some rubber tape a tight joint was made which kept out the water without interfering with the illumination. At their greatest depth, i. e., in the strong room, the divers worked 160 feet below the surface, and yet the lamps were quite equal to the hydrostatic pressure encountered.

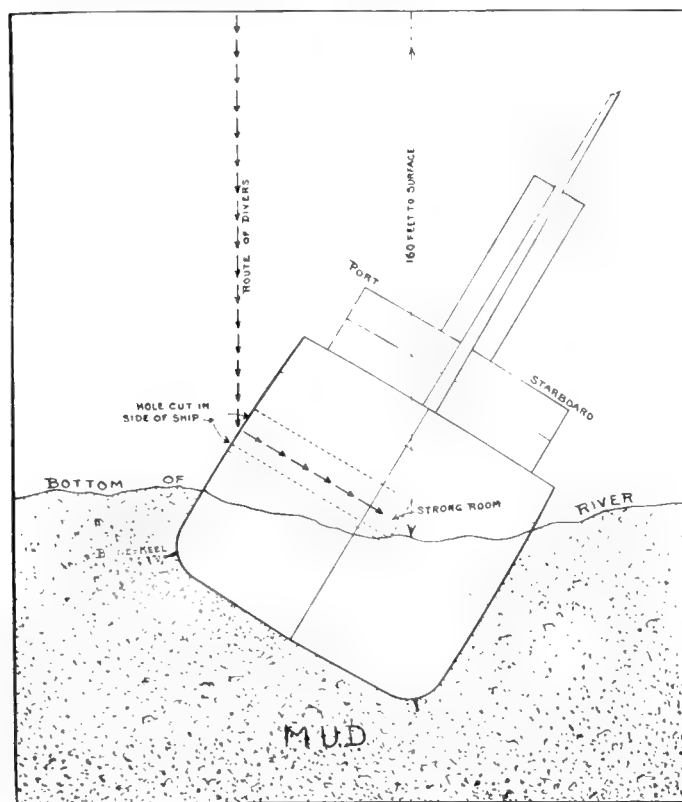

But before the men were allowed to go inside of the ship to save the treasure and to recover the mail pouches, the flanking doorways to the six staterooms were sealed and the lengthwise passage blocked off by two bulkheads in order to give a straighter route and one freed, to just that extent, of pitfalls into which the divers might turn should they become confused. Another precaution was taken to guard against accidents. The chief engineer had made a pasteboard model of the immediate path to the room holding the bullion and the adjoining compartment containing the mail matter, and the divers were drilled with this miniature until they could describe with their eyes shut just which way they would have to turn in order to get out of the vessel should their lights fail them at any point.

Because of the coldness of the water the divers were soon incapacitated by their hands becoming numb. Ordinarily the hands are the only parts of an under-water worker that are not covered, and the reason for this is that the diver depends largely upon his sense of touch to guide him where he can not see. It was plain that something would have to be done, and Yankee inventiveness suggested rubber gloves. The English seamen divers and the Canadians objected at first, but finally thin but durable American rubber gloves were found and these, while protecting their hands, did not interfere with a nice sense of touch. The importance of the part played by these coverings can be gathered from the fact that the twelve expert divers engaged used up quite a hundred pairs before their services were ended.

Owing to the hazardous nature of the work the divers always descended in pairs, so that one could help the other in case of need and both could use their united efforts the better. To further facilitate their joint labors a very recent development of a submarine telephone system was employed, and this was somewhat improved by modifications suggested by one of the American engineers. Usually divers communicate with the surface by means of signals in the form of pulls upon the connecting lifeline or by tapping so many times on the helmet of a companion worker. This code is limited. It was vitally necessary that the men should be able to communicate vocally with one another so that their efforts would tell most with the least physical stress, for in very deep submergences a man can really do but little muscular work. Therefore each diver had a telephone circuit reaching to a central station on the surface salvage vessel, and the attendant there could relay at once a message from one to the other of the divers or could send them orders or give appropriate directions to assistants on the boat handling some part of the co-operating outfit, such as a hoisting engine, an air pump, etc. This telephone system—and we know the part that rubber must have played in its get-up—was one of the most useful features of the salvage plant.

One of the things discovered by the Admiralty investigators was that the prevailing hand pumps did not furnish enough air to the diver when working at depths of 130 feet and more. The manufacturers set about improving the pumps, but the salvors soon found the burden an extremely heavy one when trying to send air enough down to the six divers working on the sunken vessel. It took four men to crank each pump and but a short time was needful to exhaust them, and four more fresh men had to be ready to take up the grinding job in order that there should be no halt in the air supply. A break-down, even though brief, might prove fatal to the divers below; and here, again, American ingenuity filled the breach.

Our own naval authorities had made some experiments, and they found that compressed air could be stowed in tanks and thence fed directly to the submerged workers toiling at best in water of moderate depths. The problem for the salvage engineers in the present instance was to amplify this and to make it equal to the demands of several divers operating between 140 and 160 feet below the surface of the tide. Therefore, on the schooner "Marie Josephine," the salvors' floating base, two big air tanks were installed, and then steam-driven compressors, instead of hand-propelled pumps, were utilized to store the air in sufficient measure to meet liberally every condition with a generous surplus. The armored rubber air hose was attached to these tanks with suitable intervening valves which could be manipulated to feed the air to the divers at just the pressures indicated by suitably sensitive gages. One man at a valve with two outlets sufficed to attend a couple of divers, and this not only simplified operations, but added greatly to the security of the men.

POSITION OF "EMPERESS OF IRELAND" AND ROUTE BY WHICH DIVERS ENTERED HULL.

The removal of the mail pouches was not a particularly troublesome work, and the recovery of the bars of silver bullion was only a little bit harder, because each ingot was handled separately and was dragged out of the strong hold by means of a hoist rigged on the attending surface vessel. A canvas bag with a framework of bar steel was fashioned, and a hole in the bottom of this bag permitted the water to escape freely. One by one the ingots were placed in this receptacle and guided by the divers out of the strong room and thence through the two succeeding doorways into the straight passage leading outward to the hole cut in the vessel's side. The pull on the connecting line was nicely regulated by telephone directions dispatched by the divers. The really serious undertaking was that involved in getting out the purser's safe, which had been set into a special niche built for it in the corner of the strong room. The divers had to dislodge this strong box by means of crowbars and then

to pass around it a chain sling to which was attached a small but strong wire rope. This line was then led carefully around pulleys at each sharp turn and provision was made for securing or "stopping" the cable at frequent intervals as the safe was steered along its round-about path and over and up the sharply slanting and slippery deck of the steamer. It was needful that the pull exerted by the hoisting engine should be uniform, lest a sudden jerk part the wire rope and endanger the lives of the divers piloting the safe. If that cable had snapped and cut the rubber suit of either of the men it would probably have meant certain death, while to have been caught or squeezed by the runaway safe would have proved equally disastrous. None of these mishaps occurred, thanks to the exhaustive preparations made and the thoroughness and the skill with which every manoeuvre was carried out.

In kindred undertakings at lesser depths the practice has been to blast away the ship's structure intervening between the free water and the objective—this, assuming that the water be clear enough for light to come down from the sun. In the present case the depths of the St. Lawrence were very dark, and to have blasted the steel work would have produced shattered plates and tangled frames that would all too easily have either caught or cut the air hose and the divers' life-lines. So, too, explosions of this sort might have desecrated the bodies of imprisoned passengers. Therefore, the salvors set for themselves a harder task, a finer job of under-water engineering; but, thanks to these preparations, they accomplished all that they set out to do. Not only were the safe, the bullion and the mail pouches salvaged, but 170-odd bodies were recovered.

These salvage operations on the sunken "Empress of Ireland" stand without a parallel in the art of under-water work, and but for the agency of india rubber in its various applications this masterly achievement would have been out of the question.

THE RUBBER GROWERS' ASSOCIATION AND THE WAR.

The Council of the Rubber Growers' Association, of London, has approved a proposal to raise funds through the membership of the association for the purpose of presenting to the War Department a motor ambulance for the use, preferentially, of the Indian Expeditionary Force; such an offer having been made and gratefully accepted. A committee was appointed to carry out the necessary details, composed of—John McEwan, president of the association; A. Bethune and H. K. Rutherford, former presidents; Sir John Anderson, head of the firm of Guthrie & Co., of Singapore; T. Cuthbertson, the Honorable Everard Fielding, E. L. Hamilton, John A. Roberts and W. Shakespeare. If sufficient donations are received it is proposed to maintain a chauffeur for the car and to provide running expenses.

It is proposed also, out of the suggested funds, to present to the war ship "Sydney" of the Australian navy, a life saving collar made from plantation rubber for each member of the personnel of that ship, in recognition of her service to British commerce in destroying the German cruiser "Emden."

A BRITISH FIRM IN THE MARKET FOR EBONITE OR VULCANITE.

Kemp's Vulcanizing Co., Limited, of 19 Hardman street, Manchester, England, is desirous of securing supplies of ebonite or vulcanite goods, which in the past they have purchased in large quantities from Germany, and would be glad to get in touch with American manufacturers of this class of goods.

It is to be noted that many American rubber manufacturers who had adopted plantation rubber in certain special compounds are turning to coarse Para, Ceara and Centrals. They took to the plantation slowly, and will doubtless go back to it with equal slowness.

New Rubber Goods in the Market.

RUBBER TOYS AND NOVELTIES.

THE fact that many of the toy factories which have in the past supplied the American market with toys have been inactive for some time owing to the war has had no noticeable effect upon the offerings in this line during the holiday season; and the toys of rubber have never been more varied or pleasing. The present situation in this line is one of wonderful opportunities for the toy manufacturer, buyers being not only willing but extremely anxious to examine samples produced here to replace similar lines that they are unlikely to be able to secure from abroad for some time to come.

Red rubber animals, rattles and dolls in all the accustomed styles have been sold in quantities, some enterprising retailers filling baskets with these rubber toys and selling them at prices up to \$8 per basket. The little rubber Kewpie has been extremely popular. The up-to-the-minute doll, however, is the doll that dances, and the above illustration shows a pair of dusky damsels who, beside being expert in the execution of buck and wing dances,

can also be induced to give exhibitions of the fox trot and other late bewildering combinations of movements. The dolls are twins, attached by an elastic cord encased in ribbon, and when dangled over the finger their gyrations and droll expressions are extremely amusing. Another funny little new doll is "Billy Bumper." And he can be bumped around with perfect safety, for he is composed largely of rubber, his body consisting of a rubber ball, his head and feet being made of cotton.

Many new forms of toy balloons have been shown this season. The charm of this form of amusement knows no season, however, and has as strong a hold on grown-ups as on the younger members of the family, for no New Year's Eve celebration is complete without its toy balloon souvenirs. The bagpipe balloon is a favorite for occasions where noise is considered desirable. It has a wood mouthpiece and trumpet on which tunes can be played in imitation of the Scotch bagpipes. Another novelty is the dying pig. This balloon when inflated resembles the accompanying illustration, and as the air escapes the pig squeals, until its final collapse. Then there is the balloon

made in two colors, for either air or gas, and known as the "Tango" balloon, the crying balloon, the balloon that whistles and the balloon made to resemble a football, including the side

lacing effect. Still another style is made torpedo shape, being capable of inflation to a length of 14 inches. This style can be had with stick and pom-pom attachments, or with a string at one end and a pin wheel attached to a cord inserted in the other end, so that when the balloon is drawn through the air the pin wheel revolves. Most of these balloons can be had either with or without self-closing valves.

Torpedoes and airships suggest warfare, and that attacks by the latter craft may be rendered ineffective a new balloon cannon has been devised. This is a model of the Krupp gun designed to fight air ships. This military toy is, of course, made of metal, but its ammunition consists of rubber plugs. Coast guns, Howitzers and field artillery consume large quantities of these rubber plugs, rubber projectiles and rubber balls.

The rubber stamp manufacturers have also contributed to the amusement and education of the small members of the family by supplying rubber stamps, sets of which, at 25 cents for 12 stamps, will turn out endless numbers of soldiers and sailors, animals and hunters, wild west and circus performers, Brownies and Teddy bears, quaint and dainty little Kate Greenaways, etc., etc.

The toy departments display so many toys in which rubber cord is used—if to a small extent in individual instances—as to

RUBBER STAMP SOLDIERS AND SAILORS

make the supply of this article to the toy makers an interesting possibility. For instance, it would be interesting to know the quantity of cord necessary to adjust the arms and legs of a holiday supply of dolls; to equip the aeroplanes and other flying craft, which are propelled by rubber cord wound in strands; to suspend the bugs, beetles and other springy-legged figures known

KATE GREENAWAYS.

as Japanese trembling novelties, to serve as joints for the wooden circus toys, animals and clowns, and to propel the torpedoes that destroy bath tub battleships, etc

Miniature hot water bottles, nursing bottles, etc., have appeared, making an irresistible appeal to young mothers of baby dolls. The rubber hot water bottle is 3 inches long and 1½ inches wide, and is an exact imitation of the ordinary sized article. These novelties and the miniature atomizer with rubber bulb are made under the familiar brand "Alpha." [Parker, Stearns & Co., Brooklyn.]

AYDELOTT'S WATER BANDAGE.

This is really a hot water bottle made in the form of a broad belt. It has a removable cover, made of soft fabric, to which is attached a webbing fastener. It can therefore be worn about

any part of the body and retained as long as necessary. The bandage is also arranged so that with tubing, etc. it becomes a combination water bottle and syringe. [J. R. McCormick, The Xenia Rubber Manufacturing Co., Xenia, Ohio.]

THE "PINNACLE" TANK BULB.

Tank bulbs are today used by the hundred thousand, and poorly constructed ones cause an everlasting lot of trouble. On the other hand, a bulb properly made lasts a long time and acts perfectly. The "Pinnacle" is one of the excellent sort. The upper part of it is made of hard rubber, and is absolutely rigid; the lower part is of soft, slate colored rubber, and is a perfect valve seat. A point in the shape of the bulb is the concave slope, which allows it to come rapidly to the surface when released, thus insuring a flush of the full

capacity of the tank. The top and bottom of the bulb are welded together by the perfect lock-grip coupling. [The B. F. Goodrich Co., Akron.]

THE "BESTYETTE" RUBBER APRON.

Rubber aprons in housework and in factories are becoming more and more a necessity; indeed a light weight, white, rubber apron is much more sanitary, cleanly and practical than the calico aprons of a generation ago. Where they are used in factory work they are said to be much more economical than cloth aprons, because they are easily cleaned with soap and water and need no laundering. The illustration shows a modern type called the "Bestyette," made of white rubber sheeting, light and strong, and guaranteed not to crack or peel. [N. Y. Mackintosh Co., Mamaroneck, New York.]

**HAY'S HAIR HEALTH APPLIER.**

This device is a rubber cup containing a sponge. It is for the purpose of applying liquid hair growers to the scalp. It is made particularly for one special hair grower, but can actually be used for any scalp application. It is really a very cleanly and simple method for scalp massage or for the application of anything excepting animal greases. [Philo Hay Specialties Co., Newark, New Jersey.]

A new tire called "Air in All" is being offered to the trade as a means of eliminating tire punctures by Achile Brile, of 17 West Broadway, New York.

The company is showing a new waterproof Pullman apron with pockets for toilet utensils, wonderfully convenient in traveling.

WATTERS ICE HELMET.

Ice caps, ice helmets and head coolers of a great variety are manufactured by the druggists' sundry makers the world over.

Some are made of pure rubber, some of C. I. rubber, and in a variety of colors. They are, of course, for reducing temperature in cases of fever or sunstroke. The cooling medium is either ice water or cracked ice. The Watters helmet, shown in the accompanying illustration, is a special type, consisting of a double cap which fits snugly over the head, and is tied under the chin with tapes. [The Hospital Supply Co.,

53-55 Fifth avenue, New York.]

A NEW JAR RING.

The ring in question is not the standard flat ring but round—made to fit a special jar, which has two grooves at its upper end. In sealing the jar the ring is placed in the upper groove, and when the vacuum is created by the shrinkage of the hot contents the rubber ring rolls into the lower groove and the

jar is thoroughly sealed. A point in favor of this type of jar ring is that in prying the cover off the ring is in no way injured—something that is likely to happen with the flat ring. [All-Glass Sanitary Package Co., Pittsburgh.]

RUBBER RATTLE AND TWO NEW RUBBER BALLS

Rattles are a source of great joy to the small child, and here is one combining with its possibilities in this direction the properties of a teething ring and a further value in familiarizing the child with the letters of the alphabet. This rattle is made of white rubber, designed by Mr. Eddy, of the Goodyear Rubber Co., Milwaukee, Wisconsin, who is also responsible for the alphabet and pennant rubber balls mentioned in the November number of THE INDIA RUBBER WORLD. Two other new rubber balls have been brought out by this company—the "Scouto" and the "Campo"—designed by Mr. James Suydam.

**THE PACKING WITH THE LIP.**

Crandall's Hydraulic Packing, often referred to as the Lip Packing, is fundamentally different from the ordinary packing, as on the inside it is finished at one end with a thin rubber lip which the pressure forces against the rod or plunger, thus making the joint extremely tight. And it works automatically, for the greater the pressure the tighter the packing becomes. [Crandall Packing Co., Palmyra, New York.]

"LEATHEREX."

This is the name of a new and specially prepared sole leather substitute just placed on the market by the Tyler Rubber Co., of Andover, Massachusetts, manufacturers of the famous "Tyrian" rubber articles. This new soling is supplied to the trade in sheets, graded for the most economical cutting, in various colors. Although it is absolutely waterproof, it does not draw the feet. It is claimed for this sole that it will outwear sole leather, while costing less, a claim emphasized by the makers, who also advance the statement that prices will not fluctuate but can be quoted for a long period in advance—in striking contrast to conditions in the sole leather market, where supplies and quotations are alike uncertain.

THE "ALL-WEATHER TREAD."

A new style in rubber soles is one for winter shoes shown in the accompanying illustration. In this the middle of the sole surface only has deep corrugations, the part containing the corrugations being $\frac{1}{4}$ inch in thickness. The shank, however, is only $\frac{9}{64}$ ths of an inch thick and carries a thin heel, the idea being to add a separate rubber heel to it. The shape of the sole is eminently modern, and it is made in sizes to suit leather shoe manufacturers. [The Good-year Tire & Rubber Co., Akron.]

**CHILD'S RUBBER SOLE.**

The mail-order houses of necessity originate and secure many of the best novelties. A child's rubber sole, for example, is the product of such a house. This sole is simply a smooth molded sole with a broad leather tip for both toe and heel. By this combination the foot has a perfect grip whatever the weather, and the values of both leather and rubber combined. [Sears, Roebuck & Co., Chicago.]

**RUBBER SOLED BASKET BALL SHOE.**

"Whatever the sport, we make the shoe" is the ambitious claim of the makers of this type of sporting shoe. Not only do they think well of their general line, but so well of this shoe that they have patented it. As far as the leather part goes, the upper is made of Kangaroo of extremely light weight. The sole is of the suction type, with 14 recesses in the sole and heel. It is made of high-grade reinforced rubber, and may be had in either red or gray. [Athletic Shoe Co., Chicago.]

**THE ARMORTRED SOLE.**

This is a new rubber sole, lighter than leather, of good wearing quality, and is not a perspiration inducer. These soles, $\frac{3}{8}$ of an inch thick, are now being worn by policemen, motormen and others whose occupation requires a heavy soled shoe that is flexible and comfortable. [The B. & R. Rubber Co., North Brookfield, Massachusetts.]

"DURABLE KOMPO."

Another substitute for the leather sole is the "Durable Kompo." These soles are guaranteed against cracking and becoming spongy, to be uniform in their composition, even wearing, light in weight and resilient. They are made in black, tan, gray and white, and are described by the makers as "the all-season sole that outwears leather." [Plymouth Rubber Co., Canton, Massachusetts.]

THE "BINGO" EGG STAMP.

It is really a very difficult thing to get a rubber stamp that will print on the surface of an egg, and yet egg buyers are, many of them, scrupulous about knowing, at least approximately, when the egg was laid. The "Bingo" egg stamp is a modern dater which is adapted to print legibly and quickly on the surface of any hen's egg. [The J. F. W. Dorman Co., Baltimore.]

THE BARNETT PUMP PEN.

A great variety of automatic fillers center about hard rubber fountain pens. What appears to be a very simple device is shown in the accompanying illustration. The barrel of the pen and the parts are of standard make, and the variety of ornamentation is also standard. The novelty of the pen lies in the pump operation.

It is very similar to a small piston syringe, and if the piston be tight there is no reason why the barrel should not fill perfectly. There is another advantage, which is that pumping water in and out through the barrel cleanses the pen and barrel effectively. [Ira Barnett, 61-69 Gold street, New York.]

STORAGE BATTERY FILLING PLUG AND HYDROMETER SYRINGE.

The double cover with filling plug of hard rubber and soft rubber gasket shown in the illustration are important parts of an "Exide" cell—the new plug and aperture particularly—as these prevent flooding the cell by controlling the amount of

water needed to replace that lost by evaporation. There is no inner gage or cover to watch while filling—just a neck of liberal diameter closed by a plug. In use one simply removes the plug, fills until the liquid rises in the neck and replaces the plug. This automatically retains the necessary air space for the expansion of the solution when the cell receives a gassing charge.

A very neat instrument for use in connection with sparking batteries is the hydrometer syringe. The parts are a glass barrel, a rubber bulb and a hydrometer terminating in a hard rubber pipette. In use, the bulb is squeezed, the pipette inserted in the vent of the cell to be tested and enough electrolyte drawn into it to float the hydrometer free of the bottom by about $\frac{1}{2}$ inch. The specific gravity reading is then taken from the scale on the glass barrel. [The Electric Storage Battery Co., Philadelphia.]

Dentists are using a jar for sterilizing their instruments. The top is fitted with a rubber ring like the ordinary preserve jar ring. [The S. S. White Dental Co., Philadelphia.]

The Scimatco laboratory tubing is "different from any other rubber tubing on the market." So says the Scientific Materials Co., Pittsburgh.

What the Rubber Chemists Are Doing.

A COMPREHENSIVE SYNTHETIC PATENT.

H. DREYFUS has received British patent No. 17,191 (1914) for a method of producing synthetic rubber, which seems to include almost everything that can be or has been done in that line. The abridgment covers four pages of the "Official Journal," while the ordinary claims require only a short paragraph.

He divides his methods into eight separate parts, as follows:

1. Olefins, di-olefines and derived products are produced by condensation of two molecules of halogen compounds, with elimination of halogen.

2. Halogen compounds are transformed by cyanides into butadiene derivatives.

3.—Aldehydes or ketones may act on the halogen derivatives of unsaturated hydrocarbons.

4.—Acetylene is transformed into acetaldehyde by water.

5.—Sodium may act on the halogenides.

6.—Polyhydrox compounds are transformed into furfurans.

7.—The above are reduced and water eliminated.

8.—Glycerine esters, etc., with at least one double bond—preferably two—are transformed into di-hydroxy derivatives by adding two hydroxyls to double bonds.

The above are converted into caoutchouc-like products by condensing agents, and about everything mentioned in Bernstein is claimed as a condensing agent. The product is to be vulcanized by the usual methods.

A UNITED STATES PATENT USING PONTIANAK.

United States patent No. 1,110,765, issued to J. W. Frank, is for a composition for painting plaster with ponti rubber and resin and Indian copal dissolved in alcohol or acetone, after removing the saponifiable matter with alkali. Attention may be called to the fact that a few years ago Carleton Ellis obtained a pretty comprehensive patent on the use of pontianak resin in cement coatings, the claims being based on the property of pontianak resin to resist the action of alkalies and be unsaponifiable. Attention was called to this property several years ago in this journal in articles describing deresinating processes.

ACETIC ACID FOR COAGULATING PLANTATION LATEX.

Owing to the disarrangement of business the Eastern plantations are now suffering from a scarcity of acetic acid for coagulating latex, and there seems to be considerable discussion as to how supplies are to be obtained.

The Germans have been writing on this subject and state that the world's supply of this acid is known to be produced in Germany and Austria.

It may be mentioned that one-half the supply of acetate of lime from which this acid is made is furnished by the American wood distillers, and that we shipped 80,000,000 pounds of acetate of lime to Europe in 1912, containing about 60 per cent acid. The United States has a number of large chemical companies which make acetic acid of all grades.

It has been calculated that the 50,000,000 pounds of plantation rubber will require 150,000 pounds of acetic acid for coagulating the latex. This would require 250,000 pounds of acetate, worth in New York \$5,000; and the acid in the East would be worth probably about \$15,000.

The possibility has been suggested of setting up wood distillation works, to be conducted along European lines, with the production of the various by-products, such as alcohol, in addition to the acid.

The Eastern technical journals state that Mr. Campbell, of Ceylon, who is attached to the Department of Agriculture,

has experimented with a small retort and has distilled some cocoanut shells and produced a few pounds of acid, and Mr. Kelway Bamber, of Peradeniya, has also interested himself in the subject. Acetic acid is said to be manufactured in Colombo on a small scale.

It may be said without fear of contradiction that no complete wood distillation plant could be installed for the production of such a small amount of acid as is required by all the plantations, as the smallest American works would have ten times this capacity.

It is quite possible that the proper solution of this problem would be the installation of a pair of retorts as used in the United States, which would handle about 6,000 pounds of cord wood daily and produce about 3,000 pounds of pyroligneous acid, containing, say, about 6 per cent. acetic acid. This should have all the power of acetic acid as a coagulant, and, in addition, the tarry matters present should have the same preservative effect as in the smoking of Para. In fact this "liquid smoke" should produce "smoked sheet."

The acid would, of course, be dilute as compared with the glacial acetic acid now used, but as it would be produced near the point of consumption the transportation problem would not be very serious.

One thing in connection with acetic acid used for coagulation must be borne in mind, which is that it has been found that some acid contains a small quantity of copper dissolved from the copper condensers, and that this copper makes it unsuited for coagulation, as it produces a slimy coagulation and the product is useless for any purpose.

This means that the final condensation must be made in glass, pottery ware or lead. This would prevent the possibility of copper in the acid. Acetic acid produced from alcohol has also been suggested, but this is merely vinegar and is necessarily quite weak, as ordinary vinegar contains only about 4 per cent. acetic acid.

PROPERTIES OF SOLID DI-ELECTRICS.

Paper presented before the Washington Academy of Sciences, giving results of experiments on the surface resistivity and the volume resistivity of di-electrics.

The volume resistivity is the resistance in ohms between two faces of a centimeter cube.

The surface resistivity is the resistance between two opposite edges of a centimeter square of the surface film which is deposited on the material.

The following table gives the volume resistivity of a few of the substances tested:

Special paraffine	over 5,000 x 10.15
Ceresin	over 5,000 x 10.15
Hard rubber	1,000 x 10.15
Clear mica	200 x 10.15
Sulphur	100 x 10.15
G. E., No. 15R	40 x 10.15
Halowax, No. 5,055B	20 x 10.15
Bakelite, No. 558	20 x 10.15
Shellac	10 x 10.15
Sealing wax	8 x 10.15
Moulded mica	1 x 10.15
Unglazed porcelain	300 x 10.12
German glass	50 x 10.12
Platt	20 x 10.12
Opal glass	1 x 10.12
Black condensite	40 x 10.9
White celluloid	20 x 10.9
White gallalith	10 x 10.9
Vermont marble	1 x 10.9
Ivory	300 x 10.6
Slate	100 x 10.6

Caoutchouc Mousse, or rubber foam, described lately in the "Scientific American," is really sponge rubber very much sponged. It is a French invention and is based on the fact of the increase of the solubility of gases with the increase of pressure.

To make it, rubber, softened by massing and partially vul-

RUBBER FOAM AS IT APPEARS IN THE MICROSCOPE.

canized, is enclosed in a steel tube with nitrogen at a pressure of 3,000 to 4,000 atmospheres. The gas dissolves the softened rubber and, when the tube is opened, expands it to four or five times its former volume, when it solidifies. It is said to be of use for a variety of purposes where any very light sponge rubber could be used.

NEW PROCESS OF LATEX COAGULATION.

According to the claims of the patent taken out in Brazil by Professor Heinrich Coloseus, of Berlin, it has been recognized of late years that the quality of rubber is subject to wide variations, in accordance with the mode of its extraction and coagulation. Considerable progress has been realized in this matter, but without a thoroughly satisfactory process having been discovered.

In addition to the methods of smoking usual in Brazil, coagulation has been effected by one or the other of two systems. By the first, the rubber and the bodies which accompany it are precipitated by the addition to the latex of various acids, while by the second substances are added which precipitate or transform into salts the solid bodies suspended in the rubber latex.

The disadvantage of all these processes is that they precipitate albuminous substances at the same time as the rubber, and in such a form that they rapidly decompose, and lead to the decomposition of the rubber. Under the new patent the albuminous substances are eliminated in such a shape that their durable stability is assured.

For this purpose an alkali is first added to the latex, in particular hydrate of potassium or of sodium, or of any other substance with alkaline reaction, working with the formation of a soluble salt on the albuminous and other bodies which accompany the rubber. If necessary the reaction can be completed by heat. By the addition of heavy ferrous or alkaline-ferrous salts, hydrates or oxides, or of mixtures of these substances, the soluble salts of the albuminous or similar substances are transformed into compounds difficult or impossible to dissolve in water. The separation of the solid bodies takes place either immediately, after a protracted rest, or after heating. In the rubber as separated are then found the albumen or the albuminous substances, or the saponifiable resins in the form of their insoluble salts.

It is stated that the products obtained by the experiments made on this system have been found of excellent quality.

PHYSICAL TESTS OF RUBBER.

IN the "Bulletin de l'Office Colonial," Paris, Messrs. Heim and Chêneveau have lately dealt with the methods of physical tests of rubber in connection with their commercial value, emphasizing the following points:

I. The possibility of differentiating two rubbers by numbers indicating their industrial value. In the present state of knowledge, purely chemical determinations will not solve the problem, which calls for mechanical or physical tests.

II. A rapid test of the crude material would simplify matters a good deal.

The physical tests include: Extensibility with constantly increasing loads; elasticity of traction, cycle of hysteresis and permanent elasticity; combined test of extensibility and elasticity "nerve"; successive cycles of hysteresis; extensibility with constant charge; varying length of charge; tenacity; compression with progressively increasing loads; elasticity of compression; extreme compression; friction or abrasion and hardness.

III. ELECTRIC TESTS: Resistance of insulation; resistance; dielectric constant; electrostatic rigidity.

IV. VARIOUS PHYSICAL TESTS: Action of heat; action of light—coloration, absorption; solubility; viscosity of rubber solutions; adhesion; absorption and diffusing of gases.

V. Determinations have been tried of the viscosity of raw material dissolved in appropriate solvents. These tests consisted in dissolving the rubber in benzine and running off the solution through a capillary tube. Tests of adhesion are often effected by dissolving the rubber in oil of naphtha, but are of no importance except for rubbers used in making waterproof fabrics. Other tests are those of the absorption of gas, only of interest to the aeronautic industry, as well as heating the rubber up to 100 degs. and noting the time it takes to become tacky.

VI. For the establishment of a general and useful test it has been found necessary to return to those long used for vulcanized rubber. Plantation Para, it is added, tears easily, its homogeneousness being only apparent. A test of this character only appears possible with a homogeneous layer of rubber of regular thickness.

VII. In tests of vulcanized rubber, mixed with sulphur, hot vulcanization seems to give better results than the cold process. The proportion of sulphur must not be too small nor too large.

VIII. For a long time traction tests have been made with the traction machine or dynamometer for defining tenacity and extensibility. Test pieces have generally the shape of prismatic bars, fixed at their extremities to the jaws of the machine. Two lines traced on the margin of the bar serve to indicate the extension to the breaking point. For this work it is found that moulded test pieces are preferable to cut ones.

Laws of more or less complicated nature, determined by the successive extensions and contractions of test pieces, afford a certain test of rubber, defining its "cyclic fatigue"; the rubber assuming a more stable condition, which, however, is not easily defined.

It may be concluded that the test of extensibility alone is insufficient, the addition of the test of elasticity being required to bring out the other fundamental qualities of the rubber. The larger the number of different qualities to be defined the more exactness will there be in the determination of the various grades of rubber.

A point to be noted is that when rubber has been stretched under a continuous load, applied gradually or once for all, the test piece increases in length.

IX. The most precise and rational course is that of comparing under identical conditions the technical properties of the rubber to be tested with those of a standard sample, both having been vulcanized without any other weighting substance than sulphur.

New Machines and Appliances.

ROYLE THREE-WAY HEAD STRAINING MACHINE.

THE illustration shows a new reclaiming strainer designed for heavy work, and plenty of it. The body of the machine is supported on a broad, square base. It is chambered for heating or cooling, and is accurately bored to receive the large and powerful stock worm. This has ample thrust bearings, is driven by a belt and cut spur gearing, and is capable of handling large quantities of stock. The feed hoppers are large and specially constructed for capacity. The three-way head has heating or cooling chambers, and the holes in the plates are

square instead of round. This feature is a decided improvement in straining machines where capacity is desired. The usual wire gauze strainers can be removed for cleaning by unscrewing the octagonal headed bushings with the special socket wrench provided for that purpose. [John Royle & Sons, Paterson, N. J.]

SPRIGG'S MACHINE FOR REPAIRING RUBBER GLOVES.

THIS machine is designed for repairing glove tips. Fourteen finger trees are arranged seven on each side of an electrically heated vulcanizing platen. They are pivoted on rods and the ends that rest on the platen are flattened. The finger

A—Vulcanizing Platen. B—Finger Trees. C—Finger Rods. D—Clamps.

of a glove is drawn over a tree, and the hole covered with a small piece of repair stock. This part is then located on the flattened portion of the tree, after which it is brought down in

position on the platen, and when each finger and tree has been similarly treated they are all clamped down. A thermometer attached to the platen indicates the degree of heat.

THROPP-DELASKI TIRE MAKING MACHINE.

THE illustration is a front view showing a tire core mounted on a spider revolved by a driving shaft. This shaft extends through the housing, has reverse gearing and is connected to a variable speed device so that the core is driven at various speeds to the right or left. A cylindrical head slides in a cylinder of fabric in a frame. It is moved vertically by a screw, bevel gearing and an inclined shaft operated by a hand wheel.

A—Core. B—Driving Shaft. C—Variable Speed Device. D—Cylindrical Head. E—Fabric Frame. F—Fabric. G—Friction Roller. H—Sliding Carriage. I—Forming Discs. J—Sliding Plate. K—Trimming Knives.

The fabric, cut in bias lengths, is passed under a guide roller over the wooden friction roller, under another guide roller, and is then pressed firmly on the periphery of the core. At the same time the interposed wrapper is wound on a take-up roller.

Mounted on a sliding carriage are two plates that swing in opposite directions in a curve equal to the periphery of the core. These support the two motor driven forming discs.

The various layers of fabric are laid on the core and then stretched and formed down by these discs. The bead rings are

placed on the casing and the bead cores pressed in position, after which the rings are removed and fabric stretched over the cores.

A sliding plate on the left of the core supports a hook-shaped swinging arm carrying two trimming knives which trim the edges of the casing. The tire and core are then removed from the machine and placed in a mold or wrapped for vulcanization.

McLEOD'S TIRE MOLDS AND VULCANIZER PRESS.

THE invention illustrated comprises a live steam chamber, a hydraulic press and tire molds with connections so that water under pressure is admitted to the interior of the tire casing during vulcanization.

In use a tire is placed in the mold with the annular ring between its edges, forming a tight joint. Through this ring extends a valve which automatically discharges water or admits steam to the interior of the tire. The ring also supports a nozzle that delivers water under pressure to the interior of the tire. The mold is then placed on the ram platen and connected to the water inlet, and the succeeding molds are stacked and connected

A—Tire. B—Two Part Mold. C—Annular Ring. D—Automatic Valve. E—Water Nozzle. F—Water Inlet Pipe. G—Water Receiver. H—Flexible Coupling.

together by flexible pipes and couplings. The press is then closed and pressure applied to the molds. Water under pressure is admitted to the interior of the tires, stretching the fabric, while the air is discharged through the automatic valve. Live steam is turned into the press chamber. This heats the water in the molds, and the tire is then cured both inside and out. When the cure is complete, steam from the molds is exhausted at the outlet pipe assisted by the steam pressure in the heater acting through the automatic valve.

In another patent the molds are first filled with water applied under pressure to the interior of the tire. They are then suspended from a track in a horizontal vulcanizer and connected by flexible hose and couplings to a manifold and drain pipe. The subsequent operations are practically the same as just described.

CRESWICK'S DEVICE FOR PAINTING GOLF BALLS.

THE principal features are two wood or metal discs with circular grooves lined with rubber, and when placed one above the other they form a ball race. The upper disc is re-

A—Upper Disc. B—Lower Disc. C—Tire Rubber Lined Groove. D—Lower Rubber Lined Groove. E—Spindle. F—Vertical Spindle.

volved and the lower is stationary. Paint is applied to the grooves and the golf balls are placed in the lower disc groove. The upper disc groove is then brought down in contact with the balls. When the upper disc is revolved the balls are rotated, distributing a coat of paint evenly over the surfaces.

DOUGHTY'S TIRE MAKING MACHINES.

HENRY J. DOUGHTY, who is well known in the rubber industry, especially as a designer of tire and footwear machinery, has recently been granted several patents on a series of machines and a process for making pneumatic tires. What he claims specifically is that he has evolved the first continuous process for making and curing pneumatic tires by machinery.

In the first place, a special loom weaves a strip of fabric, loose in the middle and heavy at the sides. This is woven on a slight curve. These strips are frictioned on a calender that has concave and convex rolls. From the calender the strip is lead automatically to the tire core, around which it is wound—once for single, twice for double, three times for triple plies, etc. While this winding goes on strips are applied for beads, etc. The tire tread is then added and the tire placed in a collapsible tread press that cures it some twenty minutes. Tires have been tested in Providence, where his plant is located, and have stood up with the best. In the illustrations Fig 1 shows two views of the calender, that on the left being a front elevation, and that on the right a plan view showing the machine in connection with the tire core, on which the frictioned strip is wound as it leaves the rolls. The middle roll is convex while the upper and lower rolls are concave, the contour being such as to shape the strip passing through. The middle roll is driven faster than the others to friction the rubber into the fabric.

Referring to the right-hand drawing, the fabric D is fed to the calender by worm-shaped stretching rollers E, and then passes between rolls B and C, where the rubber, being fed between rolls A and B, is frictioned into it. On leaving the calender the edges of the fabric are gripped between two pairs of spiked belts, F, set at diverging angles to stretch the web threads of the strip. It is then wrapped, while still warm, on the roll-

lapsible tire core *G*, driven by the motor *H*. There are two of these cores, *G* and *I*, mounted on a frame which slides on rails *J*. When the desired thickness is built up, the strip is severed and the other core is brought in line with the calender. The covered core is then removed and another placed to receive the strip. As the covered cores are removed from the front of the calender

F and operates the toggles *G*, forcing the core segments *D* outward into the casing. At the same time the hydraulic pressure raises the ram *K* and plate *H*, and operates the toggles *I*, forcing the four segments *E* into the casing. The upward movement of plate *H* releases guide rods *N* and allows plate *O* to be raised against stop screws *P*. This forces the parts of the mold around the casing, while steam for vulcanization is admitted through pipes *Q*, *R* and *S*. When the cure is complete the rams are lowered, which opens the mold and withdraws the core segments from the tire so that it may be removed from the ring *C*.

OTHER DEVICES.

THORDARSON'S PAPER STRIP CUTTER.—This is a machine that receives the paper, or thin material of a like nature, from the roll and cuts it into strips which it winds compactly on reels. Each cutter is circular and grooved, and has a hub. The edges of the cutters are shearing edges. The hubs are formed with grooved rubber rings. The two gangs of cutters are placed on parallel shafts with the cutting edges of one bearing against the rubber surface of the

opposite cutter. When the material passes between these revolving cutters it is cut into strips. These are wound on the reels under tension applied to the swinging reel frame by weights.

CAMERON CLOTH SLITTING MACHINE.—This prevents distortion of the material being cut by score cutters and a surface rewind roller which pulls with equal force on all the slit sections. A web tension roller smooths out the wrinkles in the cloth before it is slit by the cutters, and supplementary knives extend between the slit sections for cutting unsevered threads.

ERICKSON'S CHANNEL CEMENTING MACHINE.—The object of this invention is to control the cement feed and properly apply it. The cement tank, mounted on a stand, is connected to a belt driven stock worm that forces cement through a vertical revolving brush. There is a vertical revolving guide adjacent to the brush. This is normally held down below the brush by a spring. In operation the work is brought up against the bottom of the guide, lifting it and bringing the flap between it and the brush which applies the cement.

ADAMS INSULATED WIRE WINDING MACHINE.—This machine, which has been assigned to the Western Electric Co., winds various sizes of wire on spools of different lengths. The spool is supported on an arbor rotated by a motor. A wire guide is attached to a carriage that moves on a track. A back carriage also travels on a parallel track, and is moved to the right or left by an endless belt. These two carriages are united by a slotted lever that swings on a pivot in a horizontal plane. When the back carriage moves to the right or left the front carriage and guide move in the opposite direction, laying the wire evenly on the revolving spool. The carriage is reversed automatically by magnets on the back carriage engaging the endless belt. When the winding is complete the machine stops.

NEWTON'S DEVICE FOR TESTING AIR BRAKE HOSE.—This consists of an air valve and ports operating a piston that reciprocates in a short cylinder. A short piston rod passes through a stuffing box in the valve body, and supports an expanding clamp on its outer end. This is enclosed in a circular bushing attached to the valve body which has inner cam surfaces engaging movable fingers of the expanding clamp. One end of the hose to be tested is inserted in the clamp and air is admitted to the piston. This moves the clamp and test piece forward, and the fingers are forced together by the cams, firmly gripping the hose. At the same time air for testing is admitted through a small opening in the piston head and rod. When the test is completed the valve is opened and the hose is automatically removed from the coupling.

FIG. 1.—DOUGHTY'S FRICTION CALENDER FOR TIRE FABRIC.

they are placed on other frames for applying the treads, after which the tires are molded and vulcanized in the press shown in Fig. 2.

This is a hydraulic press, a three-part mold and a collapsible core of eight segments. The mold consists of an upper platen *A*

FIG. 2.—DOUGHTY'S COLLAPSIBLE-CORE VULCANIZING PRESS.

and a lower platen *B* for the sides of the tire, and a ring *C* for the tread, all chambered for steam. The core is made up of four segments *D* and four segments *E*, the former being connected with a plate *F* by toggles *G*, and the latter with the plate *H* by toggles *I*. The plate *F* is raised and lowered by the ram *J*, while *H* is operated by the hollow ram *K*.

With the casing *L* in position in the tread mold *C*, water is admitted to the cylinder *M* to raise the ram *J*. This raises the plate

Embargo Notes.

BEGINNING with the first of December came unofficial assurances from those connected with the State Department of the United States that the rubber embargo would be lifted shortly. Sir Cecil Spring-Rice, the British Ambassador at Washington, also stated that as soon as a "satisfactory method could be arranged rubber would again be shipped to America; the arrangement to be in the form of permits issued by the British government. So far these hopes have been realized.

The embargo and the difficulties placed in the way of the re-shipment of rubber appear to be quite effective. In October, for example, re-exports amounted to only 551,093 pounds, valued at \$295,046. In shipping to Sweden, for instance, the English, French and Swedish ambassadors agree to a shipment and then it goes up to their consuls in New York for certification—without this the ships refuse it.

A cable to THE INDIA RUBBER WORLD from The Rubber Growers' Association, London, says:

"Consider possible shortly obtain permits exemption embargo provided suitable guarantees received from United States."

The Bank of England called a meeting of bankers, where it was mentioned that America had forbidden the export of gold. The comment of a leading rubber authority in London is that if rubber is to be shipped to New York from Para gold will have to be sent for it. This same authority predicts that America will enforce from neutral countries a bond guaranteeing imports to be for home consumption only.

The Para rubber factors are naturally much interested over the rubber embargo. As a consequence they look for higher prices, and an offer of two cents advance causes a demand for five.

It must not be forgotten that England is using more rubber than ever before. Rubber goods formerly made in Germany must be made at home; and German rubber goods were a big factor in England. Of the solid tires fully eighty per cent. were German made. Hard rubber was nearly all of German make. And there was cheap hose, proofing and sundries, in all of which the Germans got their full share. All of this work and more is now being done in English factories. Even "Klingerit" is being put on the market, and one English firm has applied for permission to make the trade mark its own.

The word has gone forth that English soldiers shall wear rubber boots and the footwear factories are preparing to turn out ten thousand pairs of Wellingtons a week. Light rubber surface coats are also recommended both for British and French soldiers. The former wear coats that are cravenetted, and the latter heavy overcoats that soak up water like sponges.

Add to these requirements tires for 250,000 autos used by the Allies, ground sheet and goods for domestic use, and much rubber is required.

Another reason that the British people are looking out for their own stores of rubber lies in the fact that their shipments have been so large. This in spite of the fact that France, Germany and Italy almost stopped importing rubber. Russia, for example, took 2,100 tons in October, 1914, against 423 tons in October, 1913; while the United States took 3,873 tons, against 1,453 during the same period. In other words, Great Britain exported about 50 per cent more rubber during the month of October, 1914, than during the same month in 1913.

Points of interest in the history of the rubber embargo are the story of the English government's knowledge of large quantities of crêpe bought in New York, paid for there before shipment and consigned to "a native of Sweden." At the same time came the prohibition by the United States treasury of the disclosure of information concerning export shipments until 30 days after the vessel had cleared.

English correspondents state that it is still possible for New York to secure what it requires of plantation grades by guaranteeing that it will be used for home consumption and not re-exported. This is denied by exporters in New York, who have offered to give any sort of a guarantee. They (the British) state that the government will probably pass legislation shortly covering licenses to export to neutral countries and unrestricted exports to the Allies.

The British Prime Minister, speaking of embargoes such as wool and rubber, said in a recent speech that the measures were not taken to increase British trade nor to diminish the trade of any neutral countries, but solely to prevent goods from reaching the enemy.

The Rubber Growers' Association, of London, is trying to arrange that rubber coming from Ceylon or the Malay States through England into France no longer pay import duty. At the present time France insists upon a certificate of supervision from the British Customs, guarantees, etc. So far the Foreign Office has refused to interfere and it is doubtful if the conditions will be waived.

In response to an inquiry on the part of The Rubber Growers' Association regarding the term "British Ports" and Japan, the following letter is given out from the Colonial Office:

Copy of letter from the Under Secretary of State, Colonial Office, addressed to the Secretary, Rubber Growers' Association, under date of 21st November, 1914:

"It was intended that the exception in favor of 'British Ports' from the prohibition of the exportation of rubber from Ceylon and the Straits Settlements should apply to all ports in Australia, Canada and other British possessions. This has been made clear to the Governors of Ceylon and the Straits Settlements and all British overseas governments have been asked similarly to prohibit the exportation of rubber except to British ports.

"As regards the exportation of rubber from Ceylon and the Straits Settlements to Japan, Mr. Harcourt is prepared to entertain applications from manufacturing firms in that country for permission to export rubber from Colombo and Singapore for use in their factories. The Dunlop Rubber Co. have already been granted permission to ship to Japan for use in their mills in that country 50 tons of rubber a month, in each case, from Colombo and Singapore. Similar applications from manufacturing firms in France will also be considered.

"It is proposed also to allow shipments of rubber from Colombo and Singapore to Vladivostok for use in Russia as soon as the Russian requirements have been ascertained."

Recent advices mention a long cable message from Ambassador Page, London, in which British views on embargoes are said to be fully outlined. Great Britain asks that the United States government use all her efforts to prevent the shipment of contraband goods. It is understood that the United States will co-operate, and in that event the embargo would be lifted.

SENTIMENT IN THE FAR EAST—AND FACTS.

There is even more unrest in the planting districts in Ceylon and Malaya than in the United States. A shortage of acetic acid frightened the planters into coagulating experiments with sulphuric acid "toddy vinegar" (made from cocoanut shells), air and smoke processes, etc. It may be that plantation "pellets" will one day be in the market just as are the Brazilian.

Restriction of output was also preached. In Malacca it was proposed to tap only every other day, and in the Straits five days a week.

Both Ceylon and the Malay States have made and are making strenuous representations to the Colonial Secretary concerning the loss of their "second best customer," the United States. These will undoubtedly be listened to with as much attention as any of the many protests.

The American Consul at Colombo, Ceylon, Mr. W. A. Leonard,

is very active in informing our own state department and trying to get a modification of the embargo.

A suggestion that the United States prohibit the export of crude rubber from its own ports is being widely copied in the papers in the Far East.

DUTCH EAST INDIES.

A telegram from Batavia, Java, announces that no prohibition is to be placed on rubber shipped from the Dutch possessions in the Far East. According to the American consul there, the monthly shipments from Java and Sumatra amount to 53 tons. The new Dutch boats begin sailing from New York to Java and Sumatra ports direct the 20th of December.

The "Times of Ceylon" says, in part:

WHAT AMERICA WOULD DO.

"Local producers and exporters are hopeful that the United States government will come to the assistance of rubber importers in that country. Guarantees from individual importers in America that rubber purchased by them was for internal use only and was not for re-exportation would be of little practical value. How could such guarantees be enforced and how would it be known that rubber, originally purchased for internal purposes, might not change hands in America and be re-shipped? However, if the American government could prohibit the re-exportation of rubber from the United States the situation would be completely and most satisfactorily solved. The fact that rubber is contraband must be borne in mind in this connection, and the opinion in Colombo rubber circles is that America could not be accused by Germany of a breach of neutrality if she took such action."

EMBARGO EFFECTS.

THE Rubber Manufacturers' position as to the effect of the Rubber Embargo is thus summarized in a statement prepared by the Rubber Club of America:

The British decision holding crude rubber a contraband of war cuts off 50 per cent. of the normal supply required by the United States.

The embargo has resulted in an increase of from 35 to 45 cents a pound, or 50 per cent., in the crude product. The statement asserts that the 125,000 Americans employed in the rubber industry will suffer if present conditions continue. The cost to the industry of the embargo is \$250,000 a day, it was stated. The statement says in part:

"The reason for Great Britain's drastic action is to be found in her determination to prevent Germany and her allies absolutely from obtaining any of the crude rubber grown on the great plantations in the British colonies of Ceylon and the Federated Malay States. The importance of rubber in the present war is evident from the extensive use of automobiles for all kinds of transport, as well as rubber footwear, ground sheets, clothing and balloon fabrics.

"During the early days of October, England began to treat crude rubber as contraband of war, and about the same time placed an embargo on all shipments of rubber from the colonies to any but English ports. This meant that all direct shipments from Singapore and Colombo to New York were stopped. But rubber came on from London as before. On November 13, England extended the embargo to apply to all shipments of crude rubber from all English ports to any countries except those of her allies. Since that time no plantation rubber has been shipped to the United States.

"A special committee of rubber manufacturers and importers has been working with the State Department at Washington on this problem, and the State Department is thoroughly alive to the importance of the situation. Owing, however, to the uncom-

promising attitude of the British Government nothing has been accomplished, and the industry and the consuming public faces a very serious situation.

"Unlike the majority of our American industries, the rubber industry is entirely dependent upon crude rubber imported from foreign countries. In fact, the rubber industry is probably the largest business in this country wholly dependent on raw material brought from abroad. This makes the cutting off of her principal source of supply doubly serious.

"At the present time the only sources of supply for American manufacturers are South America, Mexico and Africa. The Brazilian rubbers are normally considered more expensive, and the African and Mexican rubbers are of inferior quality. Six or seven years ago the greater part of the crude rubber used in this country came from Brazil. On account of the increased consumption, due largely to the manufacture of automobile tires, production since that time has been increased by the addition of the cultivated rubber of the Far East, until at the present time 60 per cent. of the crude rubber used in American factories comes from the British Empire. During this time consumption has fully kept pace with the increased supplies.

"The normal consumption of rubber in the United States at the present time is about 60,000 tons annually. Of this amount about 35,000 tons is plantation rubber, which normally sells from about 45 cents to 55 cents a pound. Already the embargo has forced the price up to about 90 cents. Normally about 200 tons of crude rubber per day is consumed in the United States. On account of this great increase in cost of rubber and its collateral results, the increased cost to the industry is approximately a quarter of a million dollars per day. As to what the ultimate per diem cost to the industry will be, if the present embargo is allowed to remain, no one can predict.

"It is not only in the increased prices of rubber goods that the people of the United States will suffer through this seemingly unwarranted embargo. Fully 125,000 people are directly or indirectly employed in the rubber manufacturing industry. Already owing to the slowing up of mills due to the lack of supplies it has been necessary to lay off a good many employees. In the city of Akron alone, known throughout the country as The Rubber City, 25,000 people are employed in the rubber factories. Pennsylvania, Delaware, New York, New Jersey, Connecticut, Rhode Island and Massachusetts are important rubber manufacturing States. Unless some arrangement with the British Government is arrived at soon the effect on this important industry will be far reaching and the consumers throughout the country will be obliged to pay increased prices for all rubber goods."

IMPORTANT ADDITIONS TO THE "CONTRABAND."

The recent additions to Great Britain's contraband list will continue to effect the American rubber industry. The following are now absolute contraband: Sulphur, glycerine, zinc and lead ores, acetones, fractions of distillation between benzol and cresol, inclusive; antimony, together with sulphides and oxides of antimony; tires for motor vehicles and cycles, and repair material; rubber waste and reclaimed rubber; goods made wholly of rubber.

An American advertisement, signed by a New York crude rubber firm, in a leading German paper reads thus:

DIRECT PURCHASE AND SHIPMENT OF CRUDE RUBBER TO GERMANY AND AUSTRIA-HUNGARY.

I offer my services for the purchase of crude rubber and gutta percha of all kinds in this market. Shipment by neutral vessels to Sweden, Norway, Denmark or Italy. Cash here against receipt for delivery of goods or bill of lading. Freight and insurance against war risks can be covered here, but must be paid for in advance.

MECHANICAL RUBBER GOODS MANUFACTURERS' ASSOCIATION BECOMES A DIVISION OF THE RUBBER CLUB OF AMERICA.

AT a meeting of the Mechanical Rubber Goods Manufacturers' Association, held at the Union League Club, New York, December 10, it was unanimously decided that they should become a division of the Rubber Club of America.

A dinner preceded the business meeting, at which about 35 representative manufacturers sat down to a table handsomely decorated with chrysanthemums and autumn leaves. At the business meeting Mr. George B. Hodgman, president of the Rubber Club of America, proposed them as a division of the Club.

He was followed by Mr. William T. Cole, of the Fabric Fire Hose Co. and president of the association; Mr. George E. Hall, of the Boston Woven Hose & Rubber Co.; Mr. Howard E. Raymond, of The B. F. Goodrich Co.; Mr. John J. Voorhees, president of the Voorhees Rubber Manufacturing Co. and secretary and treasurer of the association, and Mr. S. D. Baldwin, president of the Cincinnati Rubber Manufacturing Co.

Upon motion of Mr. Raymond it was voted that the Mechanical Rubber Goods Manufacturers' Association disband and that the membership be transferred to the Rubber Club of America, with the recommendation that all firms in the mechanical branch of the rubber trade join this division. This was unanimously passed. Mr. William T. Cole was then elected chairman of this division.

President Hodgman has done notable work in merging this association with the Rubber Club of America, as it will greatly strengthen both organizations.

Mr. Cole is also just the man for the position of division chairman—he is capable, energetic and popular.

A fire has done \$30,000 damage to the wool boot factory at Hastings, Michigan, belonging to the United States Rubber Co. It was started by friction in machinery on an upper floor.

THE RUBBER CLUB RELIEF FUND FOR EUROPEAN WAR SUFFERERS

Contributions to the relief fund for the European war sufferers, started by the Rubber Club of America, to the amount of \$2,003.50, had been received up to December 26. Donations of \$25 or more, in addition to those published in our issue of December 1, are as follows:

AMERICAN RED CROSS.

United States Rubber Co., New York.....\$100
 American Hard Rubber Co., New York..... 50
 Boston Woven Hose & Rubber Co., Boston.... 25

\$175

BELGIAN RELIEF FUND

Rubber Sundries Manufacturers' Association (in lieu of their annual dinner)\$200
 Tyler Rubber Co., Andover, Mass..... 100

\$300

The amount contributed to the Belgian Relief Fund has been forwarded to the Belgian consul, Liverpool, Account No. 8, the particular branch of this work in the interest of which Mr. F. I. Buckleton, of the Northwestern Rubber Co., of Liverpool, recently visited this country.

Besides the sums above noted and those already published, \$828.50 has been contributed in lieu of tickets for the sixteenth annual banquet which has been abandoned this season.

THE RUBBER TRADE ASSOCIATION OF NEW YORK HOLDS ANNUAL MEETING.

The first annual meeting of the Rubber Trade Association of New York, an organization formed in October last by about 20 New York rubber importers, brokers and dealers in crude rubber, and mentioned on pages 665 and 79 of the September and November numbers of this publication, held its first annual meeting on November 2, when a few changes were made in the board of directors and committees. On the list of directors the name of A. V. W. Tallman has been substituted for that of H. A. Astlett. The membership committee has been increased by two additional members, Charles T. Wilson having resigned and the names of W. G. Ryckman, L. W. Bayles and T. H. Desmond been added.

The association reports rapid progress and encouraging support, its membership being about double that at time of organization, with further applications before the committee, and many manufacturers having expressed willingness to co-operate in any way likely to benefit the trade.

A NEW RUBBER COMPANY AT BUCYRUS.

The Bucyrus Rubber Co. has incorporated for the manufacture of rubber goods and has secured a factory at Bucyrus, Ohio. This company has an authorized capital stock of \$150,000, in 6,000 shares of \$25 each. Morgan Howells, the general manager—who is also vice-president and general manager of the recently organized Penn Rubber Traffic Co., and who claims responsibility for the organization of the Morgan & Marshall Rubber & Tire Co. and the Chester Rubber & Tire Co.—states that it is the hope of the company to be manufacturing on or about March 1, the output to include tires and tubes, belting, hose rubber, soles and heels. The old plant of the Bucyrus Steam Shovel & Dredge Co. has been secured and will be equipped for this line of manufacture. This property covers an area of 3½ acres, the buildings having a floor area of 47,715 square feet. The officers and directors of the company are: Elmer E. Gallup, president; Patrick J. Carroll, vice-president; Jay Taylor, treasurer; George B. Smith, secretary; Morgan Howells, general manager, and David C. Thornburg. The company also has a Pittsburgh office, at Third avenue and Wood street, in charge of G. B. Smith, general sales manager.

The Editor's Book Table.

THE LOWER AMAZON. A NARRATIVE OF EXPLORATIONS IN the Little Known Regions of the State of Para, on the Lower Amazon, with a Record of Archaeological Excavations on Marajo Island, at the Mouth of the Amazon River, and Observations on the General Resources of the Country. By Algot Lange. [8vo, pp. 468, with 6 maps and 109 illustrations. 1914. G. P. Putnam's Sons, New York and London.]

THERE is genuine entertainment in this volume of exploration and observation in a part of eastern Brazil which includes within comparatively small area some of the best and some of the least known parts of the country. This takes in the city of Para and the hinterland of that region.

Mr. Lange makes a sweeping division of Brazilians into two classes—those who wear shoes and those who do not—and he gives his hearty preference to the latter. Some of his anecdotes illustrate the extremes of these classes. Only a few hours' journey from Para

he was entertained by a rubber worker who ceremonially put on a shirt in honor of his guest but deliberately took it off and hung it on a bush when he went out to work. A little later, when Mr. Lange had returned to Para, he was refused admittance to a street car because he did not have on a necktie. Of the high society of Para, with its "South American Paris," with "its two blocks of electric glare" and its taxicabs, which whiz five or six blocks and then whiz back because there is no road on which to whiz any further," Mr. Lange has opinions not at all flattering; but for the "Caboclos," or half-breeds, who form the working class of the interior, he has unbounded regard. In this he is following the opinion of the best ethnologists, and his descriptions of the people and the reception they gave him show them in a very attractive light. We have had descriptions, often and again, of the rubber-worker and his melancholy rounds tapping the trees; but this book takes us into the rubber-worker's home and shows him as a human being, describing not only his work but his economics, his household furnishings or lack of them, and his diversions.

Prices of all civilized requirements are enormous, but still they have suffered a great decline since the days of three-dollar rubber. In this connection it is not inappropriate to express again the opinion, more than once given in this magazine, that, no matter how low the price is brought by plantation rubber, a certain amount of the Brazilian forest product will still be gathered. Much of the cost has been in the wholly absurd and artificial cost of the articles of commerce sent to the rubber

A YOUNG GIBOIA. THIS YOUNG BOA CON-
STRICTOR SOON GREW TAME AND PLAYFUL.

forests in exchange for the district's one product and, as the price of rubber declines, the worker's money will go further, his simple requirements will still be met, and he will still gather rubber.

The description of the flooded districts is particularly interesting, but the references to animal life are scanty and unsatisfying. He states that he is anxious to get a big snake-skin to show certain doubting friends in New York that there are some snakes along the Amazon. His helpers brought him a skin eleven feet long, but he says that he wants one five times that length. Mr. Lange is evidently not one of those who want but little here below nor want that little long. Mr. Lange visited with one tribe of Indians where the men are entirely nude and states that during his stay he adopted the national costume, save for one unimportant detail. Presumably, he wore his eye-glasses. And this, be it remembered, was but a short journey from the town where he could not board a street car for lack of a necktie.

The author has brought with him to New York a large collection of ancient pottery, which is, after all, more informing than snake-skins. A large number of the pieces are shown in illustration. The chapter on the products and prospects of Brazil does not, of course, make any claim to be an exhaustive treatment of so vast a subject. An appendix gives a vocabulary of the Indians with whom the author visited. An index-glossary is a helpful feature for the average reader.

INSULATION AND DESIGN OF ELECTRICAL WINDINGS. BY A. P. M. Fleming, M. I. E. E., and R. Johnson, A. M. I. E. E. Longmans, Green & Co., London and New York. [8vo, 224 pages, cloth covers.]

This is a very thorough treatment of the subject from an electrical point of view. In this day of high voltages and larger and more costly units a book of this sort is timely. The authors in the preface mention that insulation is the vulnerable part of electrical machinery. This is unfortunately true, and manufacturers and users often have suffered from unreliable insulation. The authors, who have had many years' practical experience in connection with insulating problems, have covered the field very thoroughly. To do this they have given the underlying principles covering insulation, and pointed out methods by which insulation can be carried out with precision. The volume is adequately illustrated by diagrams, and has a very complete and excellent index.

DE RUBBER-CULTUR EN DE RUBBER-HANDEL VAN NEDER-landsch Indie. By W. J. van de Leemkolle. Ruysch & Co., Batavia, 1914. [Paper cover, 48 pages.]

The book is a reprint of a lecture read during the first rubber congress in Batavia, in October last, and covers the whole field of rubber planting and rubber trade in the Dutch possessions of India. *Hevea* was introduced in Dutch India in the year 1876. Further experiments were made, beside *Hevea*, with *Castilloa elastica*, *Ficus elastica* and different kinds of *Manihot*. In 1913 there existed 550 enterprises interested in the production of rubber in Dutch Indies, of which 332 were situated in Java. The area under rubber culture extended in 1906 in Java to 25,000 acres, but had reached in 1913 245,000 acres. In Sumatra there was in the same time an increase from 6,000 acres to 240,000. The lecture gives, further, a description of the situation in the different parts of the Dutch Indies, and contains a large quantity of statistical information, which is especially useful, as those statistics go deeply into details. The little book, which seems to be printed for private circulation only, deserves to be read, as it contains in a small space an enormous amount of

material, and is a valuable contribution to the literature on the economic development of the eastern rubber industry. The volume closes with a short bibliography of the existing literature.

NEW TRADE PUBLICATIONS.

THE India Rubber, Gutta Percha & Telegraph Works Co., Limited, Silvertown, London, are the publishers of a very beautiful souvenir. The occasion for its issuance was the presentation by the Rubber Growers' Association of rubber flooring to the Hospital for Sick Children. The presentation was made by Lady Jellicoe, the wife of Admiral Sir John R. Jellicoe, of the British navy. The booklet is illustrated with interior views, showing the rubber tiling laid in the consulting and dental rooms. Incidentally it is interesting to remember that the Silvertown company has furnished rubber tiling for over 200 battleships and liners, and more than 100 banks and public buildings.

The December calendar of the monthly series which the Derby Rubber Co., of Derby, Connecticut—manufacturers of reclaimed rubber—has sent out to the trade during the year just closed is artistically pleasing, as has been all its predecessors, the complete series forming an interesting collection of views appropriate to the different seasons.

Another set of monthly calendars has been received from W. G. Brown & Co., of Cincinnati, dealers in crude and reclaimed rubber, the final number for the year showing a big game hunting scene.

The Independent Rubber Co., Limited, of Merritton, Ontario, has recently sent out an illustrated catalog of its footwear. The book is nearly 4x8 inches in size, contains 72 pages, and is printed in two colors—black and buff. The use of the two colors enables the company to give at least an approximate idea of some of its colored rubbers. It makes, for instance, certain lumbermen's shoes with red soles. It also makes an all-red boot called the "Dreadnaught." Another interesting rubber shown in this catalog not known in the States is called the "Gem." It is a high-heeled croquet with a service heel, and has as its particularly distinctive feature a Jersey cloth top just covering the instep and fastened with three buttons. It has a general resemblance to the leather button Oxford. The half-tone cuts in the catalog give an accurate idea of the company's output.

The Manning, Maxwell & Moore Co., Inc., of 119 West Fortieth street, New York, publishes a complete and comprehensive catalog of 1,174 pages. It is illustrated with excellent half-tones of the various machine tools handled by this enterprising firm of machinery dealers. The great progress made in the manufacture of modern machine tools of all descriptions is shown in this book. Automatic machinery is taking the place of the slow and laborious hand operated machines. The electric motor is applied to any machine tool, if so specified. Many special tools for specific purposes in the tool room or laboratory are concisely described and rendered still more intelligible by adequate illustrations.

As the manufacture and repair of tires constitute such an important branch of the rubber industry, the two catalogs recently issued by the Williams Foundry & Machine Co., of Akron, are of special interest. One of them (in loose leaf form) deals with "Specialties for the Tire and Rubber Factory," including building stands, various forms of nest molds, hydraulic accumulators and collapsible cores. Prominence is likewise given to the advantages of the boltless quick opening simplex vulcanizer head, of which a number of patented models have been introduced, but have failed to achieve the success attained by the new system, which can be attached to any bolted vulcanizer, making it a thoroughly efficient machine. The new head is essentially a labor-saving device, and a time saver as well, one prominent

tire factory where it is in use taking only twelve minutes to open a press containing a stack of molds six feet high and to insert a new batch.

Another prominent feature of the Akron-Williams press and vulcanizer is the automatic packing and locking device, which requires no bolts or nuts for tightening, and which is attached to the combined tire press, vulcanizer, cooling tank and mold lift, which also has the quick acting boltless head.

The second catalog, in booklet form, contains a full description of the Akron-Williams automobile tire equipment.

Both the catalogs are abundantly illustrated, and are replete with information regarding the Akron-Williams products.

The November number of the "S. A. E. Bulletin" contains much that is of interest to the tire manufacturer. It covers, for example, the standard sizes of pneumatic tires that are under consideration for recommendation for car manufacturers. There is also a paper by L. Greenwald, of the Firestone Tire & Rubber Co., well illustrated, covering "Factors Affecting Tire Wear." There is also an exceedingly practical and informing paper on "Tire Fabrics" by Henry Van Riper Scheel, of the Brighton Mills. Both of the papers are followed by interesting discussions.

The "Trinidad and Tobago Bulletin," August-October, 1914, contains interesting notes on the extraction of oil from Para rubber seeds and *Castilloa elastica* seeds. The conclusion is that the Para seed is of value as an oil producer and for feed cake, but the seed of the *Castilloa elastica* is of doubtful value.

At the Thirteenth annual meeting of the Alumni Association of the Philadelphia Textile School an interesting paper was presented by Alvin Kingsbacher on the manufacture of motor tire fabrics. The article is chiefly historical—that is, there is nothing there that has not previously been exploited. It is, however, an excellent résumé of an important subject.

The "Electrical Review and Western Electrician," December 15, published an important paper on the electric code wiring rules. It is interesting in that the United States procedure is compared with the German and British requirements.

THE SEASON'S GREETINGS.

We acknowledge with appreciation cards and booklets from the following friends in the trade expressing kindly sentiments and holiday greetings, which we most heartily reciprocate: Ajax-Grieb Rubber Co., tire makers, Trenton, New Jersey; the J. H. Day Co., manufacturers of rubber mill machinery, Cincinnati, Ohio; W. H. Miner, of The Miner Rubber Co., Limited, which manufactures rubber footwear, Granby, Quebec; Monatiquot Rubber Works Co., manufacturers of "Naturized" rubber, South Braintree, Massachusetts, and L. J. Mutty Co., manufacturers of rubber cloths and tubing, Boston.

Many other friends in the trade have favored us with calendars, souvenir booklets, etc., all of which will be mentioned in greater detail in the February number.

"RUBBER-RECEUIL."

This is a beautiful souvenir of the International Rubber Congress and Exhibition held in Batavia in October. The papers, which were delivered in Dutch, German, French and English, are printed in those languages and abundantly illustrated. An interesting portion of the booklet is a symposium of planting ideas submitted by the managers of some 80 rubber planting estates, arranged and edited by Mr. L. Lewton-Brain, Director of Agriculture of the Federated Malay States.

For the first time in the history of the crude rubber export, plantation rubber is coming to the United States by way of the Pacific. Shipments from Java are now sent to Hongkong, transferred to the Pacific Mail, and landed at San Francisco.

Some Interesting Letters From Our Readers.

PROPOSAL FOR A DISTRIBUTING AGENCY FOR PARA RUBBER.

THE writer of the following letter is now in New York. He has for many years connected with large rubber export interests in Para. He writes this letter to stimulate the interest of American rubber manufacturers in the prospect of securing their rubber direct.

"Rubber is at present imported to the United States in the following three ways: 1—Bought by contract directly from the few dealers (J. Marques, Pires Teixeira & Co., Pralow & Co., Ferreira d'Oliveira & Sobrinho). 2—Sent by merchants on consignment (dealers and a few *aviadores*). 3—Sent by agents of American houses to their head offices.

"In the first case the American merchant sends a letter of credit which enables the Amazonian dealer to draw the amount of the invoice. In the second case the merchant draws a certain percentage, generally 80 per cent. In the third case the agents have at their disposition certain funds to buy rubber there.

"The *aviadores*, the producer's representatives—daily receive rubber which they sell at the market price of the day as it is set by the dealers. This price, of course, is the consequence of the speculation of the dealer in selling the rubber before he has as yet received it (forward selling). The New York and London markets do not influence Amazonian rubber trade as they ought to. Thus the price offered there is often lower than it is here, and vice-versa. The *aviador* knows nothing of the speculation, and is often obliged to sell the rubber at lower prices than he could get by selling it directly to this market. The reason for this is that he ignores the calculations, which are very complicated and involve the daily changes of duty, freight, exchange, shrinkage and expenses here and there. This naturally requires a special study.

"My proposition is based upon this: We should deal directly with the *aviadores*, instructing them as to the proper calculations and furnishing them with adequate Portuguese codes through which they will be able to accept our offers. Instead of his selling to the dealers in Para he will be able to sell his rubber to the manufacturers through our medium. In fact a few good standing firms from Para which are receiving many thousands of kilos. of rubber monthly have authorized me to make this proposition.

"Of the 40,000 tons of rubber or 88,200,000 pounds which is the yearly Amazonian output, more or less, the United States buys, according to the statistics, about 50 per cent., or say, 44,100,000 pounds of rubber. Let us assume that the *aviadores* will sell 50 per cent. of this quantity through our medium. We will then have 44,100,000 pounds of rubber sold, of different grades.

"The actual price is: Hard fine, 72c.; Soft fine, 65c.; Caucho, 54c.; Upriver coarse, 53c.; Island coarse, 32c.; Cameta coarse, 34c. The average, being 50c. per pound, will make our sales amount to \$2,205,000 per year. Taking into consideration that we make 1.5 per cent., half of the Para dealer's profit, and 0.5 per cent. on the New York brokerage, which is 1 per cent., we will be able to make at least 2 per cent. on the \$2,205,000, which amounts to \$44,000.

"The *aviador* is furnished only with a letter of credit stipulating the conditions as to the correct weight, quality and amount, against which, after the shipment has been made, he draws at 90 days. No capital, consequently, is required for this transaction. The consumer's note when buying is the guarantee for the producer's letter of credit. In other words, the bank will issue a letter of credit against the security of the buyer's note.

Sound and reliable firms, of course, are contemplated. Otherwise they would not be able to negotiate their drafts."

OPENING FOR AMERICAN RUBBER GOODS IN LONDON.

THE following is from a London letter, written by a man who has in the past been a solid tire agent but whose source of supply is cut off on account of the war:

"I do not propose to enlarge upon the complete cessation of business between my country and Germany owing to the war, except to say that a magnificent opportunity now presents itself for securing some of the very large business German houses were doing in England in solid and pneumatic tires. I believe they secured 60 per cent. of the trade and their preparations for 1915 were very extensive.

"The salient points for securing British trade are:

"(1) Observance of English mileage guarantees to 10,000 or 12,000 miles.

"(2) Working to English measurements for standard sets. These are now of course rendered principally in millimetres.

"(3) Holding an adequate stock in London.

"Competition is of course very keen, which inevitably tends to reduce prices, but a high quality is demanded and the necessary price for such should not be a difficult matter if backed up with an efficient publicity campaign.

"Prices ruling today are round about £40 to £44 [\$19.45 to \$21.39] for a set of 6—two 920x120 and four 1,000x100—and £52 to £55 [25.30 to \$26.77] for two 880x120 and four 1,010x120, and so on; manufacturers paying the cost of fitting, which amounts to about 30s. [\$7.30] per set.

"I am merely giving these figures in order that if the proposal interests any of your manufacturers they may have some data upon which to figure out the success of a proposed attempt.

"Then there are the other branches of the rubber trade, such as mechanicals, hose, surgical goods—all of which are in great demand."

FROM HAMBURG.

AN important German rubber firm writes us under date of December 8:

"In the first half of the year business was not bad, without deserving to be called good. An extensive over-speculation in sites and buildings had caused this branch of economic life to suffer acutely, and had damped the spirit of enterprise. This fact to a certain extent affected other branches of industry.

"The war has naturally caused a great revolution in business life; but as the fighting is going on in the enemies' countries, a feeling of confidence prevails in all circles. The degree in which German industry is occupied varies considerably. All factories having directly or indirectly to do with deliveries for the army or navy are fully engaged and working in many cases with an increased force day and night. Those factories, however, which make objects of luxury and those principally devoted to export trade have had to limit their operations, but only in isolated cases has there been a complete stoppage of the plant.

"Moreover, the German rubber industry is now heavily engaged in war supplies, thousands of power vehicles being occupied for the army and having extensive requirements in pneumatic tires. Countless large and small articles in soft and hard rubber are wanted for ships, engineering troops' appliances and hospital purposes. But even in our industry the want of export orders is noticeable, the situation being accentuated by the export pro-

hibition recently issued by the government, which must be regarded as a retaliation for the English declaration of rubber as contraband. The step has been taken in the interest of the permanent readiness of the army, and is intelligible, as with the present supplies of crude rubber, although of themselves not unimportant, which were increased by large quantities from Antwerp, economy must be observed. Of late, all rubber with dealers and manufacturers has been attached, with the liberty to use it only for the necessary requirements, which are indicated in detail. The number of workers must, therefore, now be restricted, and we would be inclined to believe that the average production of the factories will not exceed one-third of that in times of peace.

"We have also been obliged to limit our operations. The workmen taken for the army, about one-fifth of our staff, have not been replaced, and the working time has been reduced to about four days a week. With any restriction, the workmen always earn enough to be able to live without anxiety. Under these circumstances, the rubber in the country will suffice for a very long time.

"Sufficient provision has been made for the families of the workmen drafted to the field, by the factory management and the state funds. Moreover, state and municipalities provide remunerative occupation for all the unemployed, on public buildings, railways, highway and canal works; and the expenditure of large sums is projected to support the industries most affected by stock orders for the public departments. It is distinctly stipulated that the necessity will not be utilized for the reduction of wages."

PRIZES AT THE BATAVIA RUBBER EXHIBITION.

POSTPONED by reason of the war, the Rubber Exhibition was opened at Batavia on October 19 by His Excellency the Governor-General of Netherlands India, supported by General (retired) De Voogt and other officials, including Heer Ottolander, president of the Agricultural Syndicate of Netherlands India and Heer Van Rijmberk, of Singapore.

The prizes awarded included:

THE INDIA RUBBER WORLD cup: To the Belgian Ministry of the Colonies; for the most complete exhibit referring to wild rubber. (Cup illustrated and described in issue of June, 1914, page 510.)

THE JURY cup: To the Holland-American Plantation Co.; for a display of models of hospitals and coolies' dwellings meeting sanitary and aesthetic requirements.

THE BATAVIA, 1914, cup: To the mountain section of the Association for the Promotion of Agriculture and Industry at Djember, and the Bezoekisch Testing Station; for the most complete exhibit referring to the cultivation of *Hevea Brasiliensis*.

THE SOERABAYA HANDELSBLAD cup: To the firm of Francis Peek & Co.; for the most complete collection from Netherlands India referring to *Hevea Brasiliensis*.

THE WEST JAVA RUBBER PLANTERS' cup: To the firm of Harrisons & Crossfield; for the most complete exhibit referring to machinery.

THE OTTOLANDER cup: To the collective exhibit of the Department of Agriculture, Industry and Commerce.

Full reports of the congress and exhibition are expected at an early date, also the results of further competitions.

A prominent feature of the congress was the demonstration by Heer Fol, assistant director of the Delft (Holland) Laboratory, of the different methods of rubber testing. A committee was appointed to establish a new testing station in Java, in which the Bridge installation (demonstrated by Heer Fol) would be employed. The proposal has received the support of several of the largest rubber culture associations.

During the time of the congress various interesting papers were read, including those of Mr. Birnie on "Catch Crops and Intermediate Cultures"; Heer C. M. Hamaker, on "Planting Dis-

tances and Thinning Out"; Dr. Cramer, on the "Selection of *Hevea*"; Dr. Rutgers, on "Insects and Diseases of *Hevea*"; Dr. A. W. E. de Jong, on "Tapping and Tapping Systems," and Dr. A. J. Uitée, on "The Preparation of Rubber." A discussion on the "Cost Price of Rubber" was opened by Mr. Birnie.

RUBBER TRADE INQUIRIES.

[100] A manufacturer of nipples, comforters, etc., wishes to get in touch with firms supplying bone rings or aluminum rings and plates, etc.

[101] An exporting house is in the market for "Sakel" rubber cement and desires to learn name of the manufacturer.

[102] A rubber toy manufacturer wants names of concerns making whistles that can be incorporated in this class of article, and that can be blown by pressure of the rubber toy.

[103] Requests have been received for names of manufacturers of gutta percha tissue.

[104] Another inquiry—from the rubber chemical industry—is for "Carbonilid."

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A commission house desires to communicate with American manufacturers of hospital supplies, such as rubber tubes and sponges, etc. Correspondence should be in French or Portuguese. Report No. 14,908.

A commission firm in the Near East desires American agencies for rubber shoes, etc. Report No. 14,912.

An old established tobacco pipe manufacturer in Great Britain desires to purchase vulcanite mouthpieces from the United States. A sample mouthpiece may be inspected at the Bureau of Foreign and Domestic Commerce or its branch offices. Report No. 14,917.

A RUBBER COMPANY IN THE MARKET FOR MACHINERY AND SUPPLIES.

The Southern Rubber Products Co., 624-6 South Third avenue, Louisville, Kentucky, is equipping a plant for the manufacture of inner tubes and rubber specialties. This plant will have a capacity at the start of 400 tubes a day. The company is in the market for machinery and also for samples and quotations on rubber and chemicals used in this line of manufacture. It was recently incorporated, with a capital stock of \$25,000.

SEALING MACHINE WITH RUBBER ROLLERS.

Where there is a single envelope to be sealed it is not a matter of vital importance as to how it is done—the time-honored method of using the tongue is quite satisfactory, if that method is to one's taste. But where there are a thousand envelopes to be sealed some other method must be pursued. Various sealing devices have been put on the market, some good and some not so good. Here is one that works by electricity, and it is mentioned here because

an important part of its construction consists of five rubber rollers. Two of them are shown in the accompanying illustration, at the top of the machine, just back of the large wheel. The envelope is first placed between a rubber roller and a wheel with a moistened edge which wets the mucilage on the flap. The envelope is then carried on between two pairs of rubber rollers, which effectually seal it. Both machine and tray are equipped with rubber feet so as not to scratch the desk or table. [Sealograph Company, Kansas City, Missouri.]

Official India Rubber Statistics for the United States.

2. For the year ending June 30, 1913.

Twenty-Fifth Anniversary Congratulations.

[THE INDIA RUBBER WORLD passed its twenty-fifth birthday last October. It was the plan of the Editor to have a special jubilee number to mark the event. With the great year on, entailing disaster and suffering and involving hundreds of friends in England, France, Germany, Austria, Russia and Belgium, we had no heart to rejoice. The event has therefore been marked only by the publication of the following letters of congratulation, letters of which we are exceedingly proud. The Editor.]

"EMINENTLY FAIR AND A VERY REAL HELP."

[From the UNITED STATES RUBBER CO., President's Office.]

I understand that THE INDIA RUBBER WORLD is approaching its 25th birthday under your leadership, during all of which time it has been my pleasure to watch its growth and strength, as well as to count you among my personal friends. I have always felt that the aim of the paper was high, eminently fair, and a very real help to the rubber industry.

Please accept congratulations of myself and my associates, and best wishes for continued success.

[Signed] SAMUEL P. COLL [President].

"A CYCLOPEDIA OF SCIENTIFIC AND PRACTICAL INFORMATION."

[From the APSLEY RUBBER CO., manufacturers, Hudson, Massachusetts.]

I wish to add my congratulations to those of the large number of friends you have made during your long and exceedingly useful career as founder and editor of the best india rubber journal in the world.

In the 25 years of the existence of THE INDIA RUBBER WORLD you, as its editor, during that entire period, have presented to its readers a vast amount of information regarding the production, treatment and products of india rubber, which you, personally, have gathered in all parts of the world; so that your journal has become a cyclopedia of scientific and practical information upon this interesting subject.

For the good of the rubber business, I trust that you will continue to be the controlling spirit of THE INDIA RUBBER WORLD for many more years.

[Signed] L. D. APSLEY, [President].

CONGRATULATIONS ON "LES NOCES D'ARGENT."

[From MICHELIN & Co., manufacturers, Clermont-Ferrand, France.]

I heartily congratulate you on the 25th birthday of THE INDIA RUBBER WORLD.

In France, when a man and wife celebrate the 25th anniversary of their marriage, we call it "les nocces d'argent."

Allow me to congratulate the happy husband of the beautiful and faithful wife, THE INDIA RUBBER WORLD.

[Signed] EDOUARD MICHELIN [Director].

"THE READING OF ITS PAGES A DELIGHTFUL PASTIME."

[From the COMMISSIONER OF THE IMPERIAL DEPARTMENT OF AGRICULTURE FOR THE WEST INDIES.]

I assuredly must congratulate both you and THE INDIA RUBBER WORLD on your long and successful connection.

From my own point of view I am particularly impressed with the very interesting work you have been able to place on record as the result of world-wide personal travel to practically every country where rubber is grown and to many where rubber-growing is only a proposition for the future. In these travels you have investigated the various rubber plants themselves and have helped to unravel some of the botanical problems they present, at the same time you have been able to form a shrewd opinion as to the commercial possibilities of rubber production in the countries you have visited.

I would congratulate you, too, on the manner in which your observations have been presented to your readers; while the information has been useful and accurate, the quaintly humorous vein running through your articles has made the reading of those pages of a technical journal a delightful pastime.

I have also to express my high appreciation of the journal in its general bearing on rubber and rubber topics and wish both you and it long life and prosperity.

[Signed] FRANCIS WATTS [Commissioner of Agriculture for the West Indies].

HAS KEPT CONSTANT PACE WITH THE RUBBER INDUSTRY.

[From PIRELLI & Co., manufacturers, Milan, Italy.]

I understand that THE INDIA RUBBER WORLD is on the point of celebrating its 25th birthday and beg to send my heartiest congratulations to yourself personally and to your newspaper.

You have achieved a remarkable task by keeping constant pace during this long period with the wonderful strides that the rubber industry has made in connection both with its sources of supply as with the growth of old and the development of new appliances.

I join with pleasure in what I think must be the general acknowledgment of this fact.

[Signed] A. PIRELLI [Director].

THROUGH THE EDITOR'S LETTERS REALIZED PLANTATION POSSIBILITIES.

[From THE WATERHOUSE CO., LIMITED, rubber factors, Honolulu, T. H.]

I wish to congratulate you and THE INDIA RUBBER WORLD on your quarter-century birthday, as it is a rare event in newspaperdom for a periodical to round out the first quarter of a century with the same editor at the helm.

I and my associates were first interested in THE INDIA RUBBER WORLD through the series of interesting letters published by you of your trip through Ceylon and the Federated Malay States in 1905; and it was through these that we realized the possibilities of investments in rubber plantations in that part of the world.

THE INDIA RUBBER WORLD has been on our table ever since and is looked forward to with interest each month.

[Signed] ALBERT WATERHOUSE [President].

"ABLE, INSTRUCTIVE AND INTERESTING."

[From the HODGMAN RUBBER CO., manufacturers, New York.]

It has recently come to my notice that THE INDIA RUBBER WORLD is about to celebrate its 25th birthday, and I want to extend to you my congratulations.

I very well remember the time when your journal was started, and if I recollect right our company was among the first to take advertising space. THE INDIA RUBBER WORLD has certainly kept pace with the great advance in the last quarter of a century of the rubber industry in the United States, and we are fortunate in having as a trade organ one that is as able, instructive, and interesting as yours. May your success continue.

[Signed] G. B. HODGMAN, [President].

"REGARDED AS VITAL AND VERY USEFUL IN EUROPE."

[From THE NORTH BRITISH RUBBER CO. LIMITED, Edinburgh, Scotland.]

I learn with much interest that THE INDIA RUBBER WORLD is to celebrate its 25th anniversary this year.

Pray accept my congratulations, both for yourself and your valued periodical, which in Europe as in America has come to be regarded as a vital and very useful part of the rubber industry.

Although we are in the midst of war and European complications, we have still time to remember with pleasure our long

association with yourself and THE INDIA RUBBER WORLD, and our best wishes are with you for long life and continued prosperity.

[Signed] ALEXANDER JOHNSTON, *General Manager*

A CONSTANT READER FOR 22 YEARS.

[From: VULCANISIERE BERLIN FRANKFURTER GUMMIWAREN FABRIKEN, Berlin-Lichterfelde, Germany.]

For 22 years I have been a constant reader of THE INDIA RUBBER WORLD and dare say that I may be a competent judge of the marvelous, steady progress your journal has taken during this period. Success in life to my experience is not a matter of hazard, but mainly due to honest, steadfast work, with a strong will to succeed. Both these qualities have been harmoniously concentrated in your person, and that accounts for the brilliant development THE INDIA RUBBER WORLD has taken under your guidance and has made it the leading journal of the branch. I heartily beg to present you my best compliments on your jubilee day.

[Signed] EMIL SPANNAGEL, *[Manager.]*

"AN INFLUENTIAL, RELIABLE AND BROAD MINDED TRADE JOURNAL."

[From WM. M. IVINS, former President of the General Rubber Co.]

A slight jog to my memory recalls the fact that your INDIA RUBBER WORLD, as I now well recollect, began its career some quarter of a century ago. I sincerely congratulate you on the fact that it is about to celebrate its 25th birthday, but far more than this upon the fact that you have made it one of the most influential, reliable and broad-minded trade journals in the world.

[Signed] WM. M. IVINS.

"A VERITABLE ENCYCLOPEDIA."

[From J. SIMAO DA COSTA, prominent Brazilian rubber authority.]

I can recall the moment I had the pleasure of reading the first number of THE INDIA RUBBER WORLD, which you had the courage to found and publish, as its responsible editor, 25 years ago. The rubber industry was then still in its infancy. I believe I have read almost every number you have published since then.

It is not for me to judge as to the exact measure of your ambitions when you founded THE INDIA RUBBER WORLD, but I am able to judge of its success, such as you have made it both literary and commercially, holding, as it does, the premier position among the publications of its class all the world over. I believe I voice the opinion of all readers of your journal when I say that, in its particular sphere and literary domain, it has influenced and contributed, in no small degree, towards the building of the rubber industries of America, and raised them to their present state of prosperous affluence.

To accomplish all of this in the way you have done, by presenting monthly to your readers a light, interesting, enlightened, progressive, readable magazine, so thoroughly comprehensive as to constitute a veritable encyclopedia of all that pertains to this particular trade, is no mean task; but you have succeeded in accomplishing it, with distinction. But you have done more yet. You have also published standard technical books of no mean value, and have ransacked the tropical regions of both hemispheres, so as to give your readers a graphic idea of the people and surroundings wherein rubber is gathered and prepared for market.

For all of this, I am of opinion that the rubber industries in general, and in particular those of America, are deeply indebted to you, and you are deserving of the highest tribute for all you have done. For my part, and in the name of Pará, I tender my sincere congratulations for having devoted twenty-five years' enterprise to an industrial publication, and for having raised it to the highest place it could have reached all the world over.

Here, in Pará we have already had the opportunity of showing our appreciation for you, personally, and as leading

light of your magazine. And I venture to say that in spite of the hard times we are traversing, you would be just as cordially fêted again today if you were to visit us once more.

And now one simple personal remark. I do not envy your successful career as the editor of THE INDIA RUBBER WORLD, but I certainly envy that light gait, active spring of your step, and congenial disposition, which make you look like a youth of forty. And right here I must stop, as I do not wish to give your age away and run the risk of your immediate retaliation. Let us be boys, in spite of our grey hairs.

May God bless and keep you, are my sincere wishes for you and yours.

[Signed] J. SIMAO DA COSTA.

"THE MOST IMPORTANT FORCE IN RUBBER TODAY."

Not often does it fall to the lot of one man to conduct so important a journal as THE INDIA RUBBER WORLD for twenty-five years, and it gives me much pleasure, as an humble student of one of the most ill-understood products of daily use, to congratulate you on the successful manner in which you have carried on the journal, making it perhaps the most important force in rubber today.

[Signed] JOHN C. WILLIS,

Director do Jardim Botânico, Rio de Janeiro, formerly Director of the Royal Botanic Gardens, Ceylon.

"NO RUBBER MANUFACTURER WOULD BE WITHOUT IT."

[From the MECHANICAL FABRIC CO., Providence, Rhode Island.]

I have known THE INDIA RUBBER WORLD and your esteemed editor, Mr. Henry C. Pearson, for almost the life of the paper. It began in a modest way, but it was indispensable from the start on account of the attractive personality of Mr. Pearson and the confidence he so quickly won with the trade, together with the excellent paper he produced. No rubber manufacturer here or abroad would think of being without it. I was fairly young and inexperienced when I first met Mr. Pearson, but I found myself confiding in him very soon, and never knew him to betray my confidence or that of any one else.

There have been indeed great changes since THE INDIA RUBBER WORLD was started. With the exception of three or four, all of my associates are dead, and I am dictating this letter from a bed of sickness.

[Signed] A. L. KELLEY, *President*

"READ IT FOR 25 YEARS, ALWAYS WITH GREATEST PLEASURE."

[From RENÉ BOBET, consulting rubber engineer, Paris, France.]

You are about to celebrate the 25th anniversary of the foundation of your estimable journal, THE INDIA RUBBER WORLD. Permit me on this occasion to send you my hearty congratulations, with my best wishes for your prosperity. You will find my name on your books, among the subscribers from the first. I therefore assisted at the birth of your journal, which I have read for the last 25 years; always with the greatest pleasure. I have remarked how, thanks to your efforts, and the constant improvements you have made in all the details of editing, you have placed THE INDIA RUBBER WORLD in the first rank of similar journals throughout the entire world.

The whole of the rubber industry ought to appreciate your efforts thus crowned with success and to congratulate you on your work.

All honor to THE INDIA RUBBER WORLD and to its eminent director, Henry C. Pearson.

[Signed] R. BOBET.

"SUCCESSFUL WORK IN BEHALF OF THE RUBBER INDUSTRY."

[From the BOSTON BELTING CO., manufacturers, Boston, Massachusetts.]

Until the advent of THE INDIA RUBBER WORLD the rubber industry in the United States had no trade journal worthy of the name. The way in which your publication has grown in size, influence and amount of advertising patronage during the past 25 years is certainly a fitting and well merited recognition of your journal and its able and accomplished editor. There are

few publications in any field where the personality of the editor and publisher are so closely identified with the industry it serves as is the case of *THE INDIA RUBBER WORLD* and yourself. It is extremely rare for such a happy combination to continue for the rather remarkable period of 25 years.

In extending upon your silver anniversary my congratulations upon what you have accomplished, please also accept my best wishes for many more years of successful work in behalf of the rubber industry. With assurances of my best personal regards.

[Signed] THOMAS A. FORSYTH, *President*.

"ITS STERLING QUALITIES, ITS INDEPENDENCE AND IMPARTIALITY."

[From PHILIP SCHIDROWITZ, rubber chemist, London, England.]

In these horrific times of war and destruction the contemplation of any event representing the arts and crafts of peace, the best that man's energy, intellect and resource can accomplish in the furtherance of humanity's well being, is as an oasis in a vast and dreary desert.

The 25th birthday of *THE INDIA RUBBER WORLD* calls for something more than conventional congratulation; it calls for sincere felicitation and gratitude from all those who, like myself, have watched its progress, its success, and who have benefited from its sterling qualities as a journal, from its independence and impartiality. It is, I believe, a rare event for an editor to have founded and successfully conducted a great journal for a quarter of a century without a break. While congratulating you on the past, I hope that you may continue for very many years at the helm of a barque which has become a valuable asset to all of us who are interested in the rubber industry.

[Signed] PHILIP SCHIDROWITZ.

"ITS MARKEDLY USEFUL AND SUCCESSFUL CAREER."

[From the DAVOL RUBBER Co., manufacturers, Providence, Rhode Island.]

Upon the occasion of the celebration of the 25th anniversary of the birth of *THE INDIA RUBBER WORLD*, I beg leave to offer you, as its founder and Editor in Chief for the full quarter century of its markedly useful and successful career, the sincerest congratulations of this company and heartiest personal good wishes for its continued growth and prosperity.

[Signed] CHAS. J. DAVOL, *President and Treasurer*.

CONGRATULATIONS FROM GERMANY.

[From DR. HEINR. TRAUEN & SÖHNE, Hamburg, Germany.]

We learn that you are celebrating the 25th birthday of your esteemed paper and wish to express to you our heartiest congratulations for that happy event.

We are quite aware that the prosperous development of *THE INDIA RUBBER WORLD*, in which we found always plenty of interesting stuff for ourselves, is in the first place due to the constant and intelligent labor of the editor, Mr. Henry C. Pearson, and we therefore hope very sincerely that he may be on his place for many years to come.

[Signed] H. OTTO TRAUEN.

"OF GREAT VALUE TO THE RUBBER TRADE."

[From the E. H. CLAPP RUBBER Co., reclaimers, Boston, Massachusetts.]

We wish to extend our heartiest congratulations both to *THE INDIA RUBBER WORLD* and its editor, on the occasion of its 25th birthday. It gives us special pleasure to do this and we feel that *THE INDIA RUBBER WORLD* for 25 years under your editorship has been of great value to the rubber trade, in that we have always found that its news was reliable news.

The writer also wishes to extend his personal congratulations to you for the smiling and genial way you have always had of trying to make your friends enjoy life; also for your work in bringing the different rubber men into social intercourse so that they could find out what a good fellow the other man was.

[Signed] E. H. CLAPP, *Treasurer*.

GOOD WISHES FROM ENGLAND

[From CHAS. MOUNTSH & Co., Limited, Manchester, England.]

We heartily congratulate you, *THE INDIA RUBBER WORLD*'s original and present editor, and trust that you and your excellent paper may continue to enlighten the india rubber world for many years to come.

[Signed] R. K. BIRLEY, *Director*.

READ "REGULARLY AND SYSTEMATICALLY" IN CANADA.

[From THE MINER RUBBER Co., Limited, manufacturers, Grafton, Quebec.]

During the writer's comparatively short connection with the rubber business, he has found *THE INDIA RUBBER WORLD* of great assistance to himself and to our staff in keeping us posted as to the doings of that part of the business world upon which we are depending for our supplies of the wherewithal to make good rubbers. But going back even farther than this, when the writer was a comparative youngster, he remembers very well the great interest the late Mr. S. H. C. Miner, the founder of our business, took in your publication, and how regularly and systematically he looked forward to reading it and how much he missed it, whenever, through some slip in our postal department, its arrival was delayed.

We trust that the success which has attended your publication during the past 25 years will be more than doubled in the future.

[Signed] W. H. MINER, *General Manager*.

"OCCUPIES AN ENVIABLE POSITION."

[From the FARRER FOUNDRY & MACHINE Co., Ansonia, Connecticut.]

Having learned that *THE INDIA RUBBER WORLD* is to celebrate its 25th anniversary, we take this opportunity to congratulate you upon its success. We well remember when you first resolved to bring out a paper to be devoted to the interests of the rubber business, and your optimistic views of the future of this branch of business. It took some courage at that time to make the venture, and you may well take pride in its success. *THE INDIA RUBBER WORLD* occupies an enviable position among the trade journals, and has kept apace, we believe, with the remarkable development of the rubber business.

With best wishes for your continued success,

[Signed] FRANK E. HOADLEY, *Secretary*.

"ADDED IMMEASURABLY TO MAN'S KNOWLEDGE CONCERNING RUBBER."

[From the STANDARD ASPHALT & RUBBER Co., New York.]

I am glad I am here yet to congratulate you on the 25th anniversary of the advent of *THE INDIA RUBBER WORLD*.

You have certainly achieved a great success, and sometimes it is a question in my mind whether the *World* grew up with the rubber business, or whether the rubber business grew up with the *World*.

Anyhow, you have reason to be proud of your life's work, and can truly felicitate yourself, as having in 25 years added immeasurably to the sum of man's knowledge concerning india rubber.

May you "live long and prosper."

[Signed] GEO. WATKINSON.

"AN AUTHORITY ON ALL MATTERS PERTAINING TO RUBBER."

[From the BOWERS RUBBER Works, manufacturers, St. Louis, Mo.]

The Bowers Rubber Works and many of its employees, who read your interesting journal, wish to most heartily congratulate you on the happy event that marks the 25th anniversary of the publication of *THE INDIA RUBBER WORLD*. Your paper is looked for and consulted as an authority on all matters pertaining to rubber.

I am sure that the splendid success already attained will continue a very long time, and, as for you personally, may your years be as many as your friends are numerous.

[Signed] W. F. BOWERS, *President*.

News of the American Rubber Trade.

THE ADAMSON MACHINE CO. STILL GROWING.

THE Adams Machine Co., of Akron, Ohio, was started in 1892 by Alexander Adamson. Fourteen years later it was incorporated. The company's plant has been increased steadily from time to time. Five years ago it built an entirely new plant, with a floor area of 45,000 square feet. Since that time this has been increased considerably over 100 per cent, so that its floor area now amounts to 110,000 square feet, and with the addition now building 135,000 square feet.

THE UNITED STATES TIRE CO. CONCENTRATES ITS WORK.

The United States Tire Co. was formed in 1911 to market four of the best known brands of tires, namely: Morgan & Wright, made at Detroit; the Hartford, made at Hartford, Connecticut; the G & J, made in Indianapolis; and the Continental, made by the Revere Rubber Co., Providence, Rhode Island. For about a year these tires were sold under their individual names. Then the four brands were eliminated, or at least subordinated, and all the tires were sold under the general brand, United States Tire Co. Now in order to manufacture with greater economy and better facilities for specialization, the company intends to concentrate the manufacture of automobile tires in two of its plants, namely, those at Hartford and Detroit, while all its bicycle and motorcycle tires will be made at the Indianapolis plant and the solid tires, for motor trucks, carriages and other vehicles, will be manufactured in the Revere plant at Providence.

NO INCREASE IN PIANO TUBING PRICES.

The Chicago correspondence which appeared in a recent number of this publication spoke of the advance in the price of rubber tubing for player-pianos. Such an advance took place soon after the outbreak of the war and the phenomenal rise in crude rubber prices, but in some cases the prices for tubing have been restored to their original figure. The L. J. Mutty Co., of Boston, for instance, advanced its price for piano rubber tubing 10 per cent early in the fall, but reduced the figure again to the original price on the first of November; and all its customers who had contracts were fully protected during the period covered by the advance. No increase in price was made in its line of rubber coated cloths.

RUBBER COMPANY DIVIDENDS.

The Board of Directors of the Rubber Goods Manufacturing Co. on December 2 declared a sixty-third regular quarterly dividend of 13 1/4 per cent on the preferred stock of the company, and a dividend of 1 per cent on the common stock—both payable December 15 to stockholders of record on December 10.

The Kelly-Springfield Tire Co. has declared quarterly dividends of 1 1/2 per cent on the 6 per cent preferred stock of the company and 13 1/4 per cent on the 7 per cent preferred stock—payable January 2 to stockholders of record on December 15; also a dividend of 1 1/2 per cent on common stock, payable February 1 to stockholders of record on January 15. This is the first dividend declared by the company on its common stock, which two years ago sold at 15 and is now in the neighborhood of 70.

The Converse Rubber Shoe Co., of Malden, Massachusetts, on December 1 paid a regular semi-annual dividend of 3 1/2 per cent on preferred stock to stockholders of record on November 25.

The Firestone Tire & Rubber Co., of Akron, Ohio, has declared a quarterly dividend of 13 1/4 per cent on its preferred stock and a dividend of 3 per cent on common stock, payable January 15 to stockholders of record on December 31.

The Apsley Rubber Co., of Hudson, Massachusetts, has declared a regular semi-annual dividend of 3 1/2 per cent, payable January 1 to stockholders of record on December 28.

TRADE NEWS NOTES.

Beginning January 1, the Boston Woven Hose & Rubber Co., at its plant in Cambridge, Massachusetts, will reduce the working hours of all employes in its factory from a 10 and 11 to a nine hour basis per day. This reduction in hours will not mean a reduction in wages to the operatives, as they will receive the same total wage per week for the shorter hours that they have heretofore received.

The Keystone Rubber Manufacturing Co. has built a \$50,000 addition to its plant at Erie, Pennsylvania, increasing its capacity about four times. The company intends to make a specialty of red and gray inner tubes.

The L. J. Mutty Co., which manufactures rubber fabrics and tubing, has moved its executive offices from 93 Federal street to 175 Congress street, Boston.

The St. Louis branch of Fisk Rubber Co., of Chicopee Falls, Massachusetts, will remove about April 1 from its present quarters at 3917 Olive street, to the 2-story and basement fireproof building now under erection at 2206 Locust street, on which a long time lease has been taken.

The American Rubber Fabric Co. has under way a 6-story fireproof concrete addition to its plant at Pittsburgh, which, when new machinery is installed, the company states will constitute one of the best equipped rubberizing plants in the country. This company produces a line of rubber hospital sheeting, raincoat cloth, automobile top cloth and many other rubberized fabrics.

The tire tread and repair stock, cement, etc., of the Stoddard Rubber Co., of Worcester and Millville, Massachusetts, is now on sale in New York City, by the Stoddard Rubber & Tire Co., of 177 Broadway.

The Marathon Tire & Rubber Co., of Cuyahoga Falls, Ohio, in a letter recently received, states that arrangements have been made by which Marathon tires will be made in Canada by a firm at St. Catharines, Ontario, under the trade name and subject to the supervision of the Marathon company. The erection of a plant there has been abandoned for the present.

The Detroit Insulated Wire Co., of Detroit, Michigan, has increased its capital stock from \$100,000 to an authorized issue of \$500,000, of which on December 4 \$250,000 was outstanding. Its manufacturing facilities are being improved and increased, and new buildings and machinery provided.

The Searle Unburstable Inner Tube Co. has been incorporated in New York, with a capital stock of \$400,000, to manufacture the Searle automobile inner tube. The incorporators are Orson Kilborn, Frederick H. Hall and J. Campbell Thompson, all of New York.

The Wellington Rubber Co., of Medford, Massachusetts, was petitioned into bankruptcy on December 15, with liabilities amounting to \$100,941, and assets \$43,754.

The East Palestine Rubber Co. has moved its executive offices from 200-2 Wood street to 439 Sixth avenue, Pittsburgh.

The Summit Rubber Co., of Barberton, Ohio, which is in the hands of receivers, states that it will not resume rubber manufacture.

A factory is being established in the outskirts of London by Johnson & Johnson, of New Brunswick, New Jersey, makers of surgical appliances, rubber bandages, plasters, etc. The factory at New Brunswick has been kept in continuous operation night and day for the past three months, filling orders for French and British hospitals, requisitions for five tons of bandage at one time being nothing unusual.

ADJUTANT TRUMBULL WARREN.

TRUMBULL WARREN, president of the Gutta Percha & Rubber, Limited, of Toronto, Canada, is one of the patriotic Canadians who are now at the front. As a youth he received considerable military training, and, as lieutenant in the Forty-eighth Highlanders, he was one of the first to respond to England's call for men. On his arrival in England he was at once appointed Assistant Adjutant on the Headquarters Staff and detailed for duty at Salisbury Plain. Mr. Warren, although in reality an enthusiastic Canadian, is very nearly a Yankee. His father, the late H. D. Warren, was a New Yorker who went to Toronto in 1887. There he at once took a prominent part in the business and social life of that busy city. He brought up his three sons, not as Canadians or Americans, but as sturdy, self-reliant citizens of the world. He also trained them in the important rubber business that he built, so that at the time of his passing the eldest son was able to take his place as president of the company. When the call to arms came he felt it "a duty" and at once responded. In the same spirit the two younger sons, H. D., Jr., and Frederic Alden, are working hard to fit themselves for service should the call come.

A TREAD OF "VITALIZED" RUBBER.

The Vitalite Rubber Co., whose offices are in the Woolworth building, New York, is putting out a tire with a new "vitalized" rubber tread, regarding which it speaks as follows in a little booklet recently issued: "Our chemist has produced a tread stock of a new compound in which nearly all the sulphur has been eliminated. This compound will vulcanize before the duck and friction are burned by the high heat, as perhaps you know there is a limit to the time that duck can be left in the heat without its being ruined. We have produced a tread that is very much tougher than any other tire on the market."

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of the shares of rubber manufacturing companies on December 28, 1914, are furnished by John Burnham & Co., 31 Nassau street, New York, and 41 South La Salle street, Chicago.

	Bid.	Asked.
Ajax-Grieb Rubber Co., common	250	...
Ajax-Grieb Rubber Co., preferred	100	...

PERSONAL MENTION.

Thomas O'Callaghan, Jr., has been appointed New York branch manager of the Empire Rubber & Tire Co., of Trenton, succeeding T. B. Todd, who recently resigned to become associated with Marshall, Wood & Co., automobile supply dealers at Plattsburgh, New York.

Richard F. Foote, factory manager and an officer of the Independent Rubber Co., of Merritton, Canada, was recently in New York and reported conditions as normal, with good prospects for increased business in army footwear.

C. D. Studebaker has been placed in charge of the New York office of the Firestone Tire & Rubber Co. Mr. Studebaker has been associated with the tire industry for a number of years, first with the Diamond Rubber Co. and later with the Walpole Tire & Rubber Co., joining the Firestone forces about a year ago.

J. J. Jordan, former manager of the Firestone company's New York branch, has gone to Europe with a view to increasing the foreign sale of Firestone tires.

R. W. White has been promoted from the management of the Columbus, Ohio, branch of the Goodyear Tire & Rubber Co. to a similar position with the Chicago branch. His successor at Columbus is W. W. Magill.

A. A. Templeton, vice-president of the Morgan & Wright Tire Co., of Detroit, Michigan, has been elected president of the Transportation Bureau of the Great Lakes Waterways Conference.

Charles Holden, of the Canadian Consolidated Rubber Co., Limited, Winnipeg, Manitoba, has been elected president of the Northwestern Commercial Travellers' Association of Canada, for the year 1915.

L. Greenwold, of Ashland, Ohio, has been appointed to the management of the Santiago, Porto Rico, branch of the Firestone Tire & Rubber Co.

At the annual meeting of the New England Shoe Wholesalers' Association, held December 9, at Young's Hotel, Boston, Mr. Fred C. Hood, general manager of the Hood Rubber Co., made an address on the contractual relations between shoe wholesalers and rubber companies, incidentally referring to the present condition of the crude rubber market and its principal tendencies.

Among those recently appointed by the Akron Chamber of Commerce to local committees are—F. A. Seiberling, head of the Goodyear Tire & Rubber Co., chairman of the street railway committee and also a member of the water committee; I. R. Bailey, department manager of the Goodyear company, municipal committee; Francis Seiberling, chairman of the entertainment committee.

C. D. Studebaker has been promoted from the sales force of the Firestone Tire & Rubber Co. to the management of the New York office.

Henry Plow, at one time treasurer of the Hartford Rubber Works Co., of Hartford, Connecticut, and later associated with the automobile industry, which he represented in London and Paris, has become sales manager and second vice-president of the Midgley Tire & Rubber Co., of Lancaster, Ohio.

TRUMBULL WARREN.

COMPANY FORMED TO EXPORT RUBBER GOODS.

LATE in November the United States Rubber Export Co., Limited, was formed, for the purpose of concentrating and bringing under one control all the export business of the United States Rubber Co. On December 2 the incorporators of the new company met at the building of the United States Rubber Co. and completed the organization. The following board of directors was elected: Samuel P. Colt, president of the United States Rubber Co.; Lester Leland and James B. Ford, vice presidents of that company; Elisha S. Williams, president of the Rubber Goods Manufacturing Co., and Homer E. Sawyer, general manager of the United States Rubber Co., also Raymond B. Brice, Charles C. Case, William E. Barker, Joseph C. Weston, Edward H. Huxley, H. Stuart Hotchkiss and William J. Maloney.

EDWARD H. HUXLEY.

The directors organized by electing the following officers: President, Edward H. Huxley; treasurer, W. G. Parson, who is also treasurer of the United States Rubber Co.; assistant treasurer, H. Stuart Hotchkiss, and secretary, John D. Carberry, who is also assistant secretary of the United States Rubber Co. and the Rubber Goods Manufacturing Co.

Edward Huxley, the president, has long been identified with the rubber business. At the time of the reorganization of the Boston Woven Hose & Rubber Co. he was one of A. M. Paul's right hand men. In 1911 he became assistant general manager and sales agent of the National India Rubber Co. Later he came to New York for the United States Rubber Co. and devoted himself to the export field. In this line he has proved himself an expert, becoming an encyclopedia of information on commercial geography, tariffs, trade routes, etc.

THE GREAT EASTERN RUBBER CO.

The Great Eastern Rubber Co., Inc., has been organized at Allentown, Pennsylvania, and incorporated under the laws of that state to manufacture, sell and distribute automobile tires and other rubber goods. The capitalization of this concern is \$100,000—650 shares of 7 per cent. cumulative preferred and 350 shares of common stock—the organizers having purchased the common and turned over to the company \$13,500 in cash, with equipment and stock valued at \$24,000, as well as a patent covering the "Crown" tire which it is their purpose to manufacture, operating a factory at Allentown. The special claims for this tire are that it has two more layers of fabric than any other tire, that its resiliency point is at the side instead of at the bead, and that it has an extra heavy tread. The officers are: V. A. Nagle, president; D. M. Knabb, vice-president; Charles R. Fluck, treasurer; A. E. Dodge, secretary. Messrs. Nagle and Dodge are experienced tire men, and Charles Sullivan, the factory manager, has long been associated with tire manufacture.

BOSTON BELTING CO.

The following is a condensed summary of the September 30 balance sheet of the Boston Belting Co.:

LIABILITIES.	
Capital stock	\$1,000,000.00
Reserve fund	800,000.00
Profit and loss	46,918.69
Notes payable	200,000.00
Unsettled bills	31,401.50
ASSETS.	
Real estate, land and buildings.....	\$351,256.01
Water privilege	150,000.00
Machinery	269,763.28
Tools, furniture and fixtures	107,876.76
Cash	53,693.94
Bonds receivable; notes receivable {	650,544.83
Investment Acct.; accts. receivable }	
Merchandise	495,035.37
Trade marks, etc.	150.00
	\$2,078,320.19 \$2,078,320.19

ALEMBIC GUM.

In spite of the explosions and their fatal results, noted in recent numbers of THE INDIA RUBBER WORLD, the Alembic Process Co., Perth Amboy, New Jersey, is still at work on its synthetic rubber. Rumor has it that it is made from turpentine and costs but 12 cents per pound. A professor of chemistry at Wesleyan University is said to have examined the process and reported favorably upon it.

A RUBBER RETAILER CELEBRATES HIS 25th ANNIVERSARY.

THE INDIA RUBBER WORLD is not the only institution connected with the American rubber trade that has recently celebrated its 25th anniversary. Howe's Rubber Store, situated in Central Square, Lynn, Massachusetts, started in business in December, 1889, and has just celebrated the completion of its 25th year. As a souvenir of this event it has distributed a little pocket memorandum book in which the reason of its success is described as follows: "This is largely due to our invariable policy of seeking quality and worth, rather than the prevalent disposition of our present day retailers—low prices."

PINES RUBBER CO. TO DO RUBBERIZING FOR THE TRADE.

The Pines Rubber Co., Inc., has purchased the business of the Anglo-American Rubber Corporation, situated at Bush Terminal building No. 19, Brooklyn. The incorporators are Joseph, David and Morris Pines, who are also proprietors of the Pines Manufacturing Co., of 55 West Twenty-sixth street, New York, which manufactures raincoats. The Brooklyn plant is being utilized for the rubberizing of fabrics for the Pines manufacturing concern, and will soon be in a position to also do rubberizing for the trade.

CLEVELAND FACTORY TO BE USED AS RUBBER WORKS.

The Standard Tire & Rubber Co. has purchased land and buildings at Cleveland, Ohio, formerly occupied by the American Fork & Hoe Co., and are making the necessary alterations to convert the plant into a rubber factory. This purchase includes two 2-story buildings respectively 360 x 120 and 300 x 60 feet and a 2-story wing 90 x 35 feet, with separate buildings for engines, boilers, etc. The capitalization of the company, at present \$100,000, is soon to be increased. The product will consist of solid tires, pneumatic tires and tubes and mechanical rubber goods, and the factory, which will probably not be ready for operation before July next, will be equipped to turn out about 500 tires per day. Its specialty will be the "Flex Steel" inner tire, a device composed of steel and rubber (both made from secret formulas in the possession of the company) and of fabric. The company's officers are: M. J. Gillen, president; George G. Russell, vice-president; C. F. Groth, treasurer; Charles B. Shaw, secretary. These officers, with E. L. Thompson, J. F. Schulte, E. W. Silver, L. R. Adams and Dr. J. V. Gallagher, compose the board of directors.

PURCHASING AGENT ROSWELL C. COLT.

THE day of infallible prophecy being past, it is quite hazardous to predict now what will take place some years from now. It would be venturesome, for instance, to predict that Mr. Roswell C. Colt, recently made purchasing agent of the Canadian Consolidated Rubber Co., Limited, would some day occupy the position now graced by his distinguished father, who is president of the largest rubber manufacturing company in the world.

ROSWELL C. COLT.

But it would not be venturesome to predict that young Mr. Colt will arrive at some highly desirable goal in the rubber manufacturing industry and for three good reasons: He has a fine start; he is headed the right way, and he is going strong.

He graduated from Harvard in 1910. It is safe to say that he might have stepped into something quite comfortable, with a mahogany desk and office boy with buttons, if he had applied for it, but he didn't. He went to Canada, bought a

pair of overalls and got a job with the Canadian Consolidated Rubber Co., Limited. He started for Winnipeg and began to hustle cases in the company's big warehouses at that place. This kept his muscles hard and incidentally gave him a chance to get acquainted with the system of distribution employed by a large manufacturing concern.

Four months later, after having mastered the distribution problem, he returned to the factory to learn how goods were made. The most important and one of the most difficult articles to make in a rubber factory is the automobile tire, so he got another pair of overalls and began tire making, working from 7 a. m. to 6 p. m. When he had reached the point where he could make as good a tire as anyone he began to look around to see what material was used in the factory, and why, and how much, and what it cost and where it came from; and in due time he was equipped to drop tire making and take up the buying of supplies, so they have made him purchasing agent.

All this in less than four years' time. Not a bad start!

S. A. E. MEETING JANUARY 5-7.

The annual meeting of the Society of Automobile Engineers will be held in the auditorium of the Engineering Societies' building, at 29 West Thirty-ninth street, January 5-7. The program includes papers on a number of interesting subjects, among which is one, scheduled for Wednesday evening, January 6, by C. B. Whittelsey, secretary and factory manager of the Hartford Rubber Works Co., of Hartford, Connecticut, on "Pros and Cons of Correct Tire Inflation." This paper and the discussions it leads to are expected to assist in the solution of the problem of proper tire inflation as associated with tire loads and sizes, which has been engrossing the attention of the standards committee of the association for some time.

TRADE NEWS NOTES.

The new offices of the Rubber Trading Co. in the Postal Telegraph building, corner of Broadway and Warren street are a move in the right direction; that is, they are more easily found by the trade. The building is modern and the customers' room is a large apartment adjoining a large sample room. Not only that, but in the top of the building is the famous mahogany Club, where so many of the downtown rubber men are wont to lunch.

The S. A. P. Co., 327 Produce Exchange, New York, informs The INDIA RUBBER WORLD that in its investigation of vegetable oils used in rubber manufacture great differences in purity are found. For this reason the company has established a department of examination, which is in charge of an expert chemist, so that absolutely pure oils of any sort can be assured.

The New York agency of the Russian French India Rubber, Gutta-percha & Telegraph Works, Riga, Russia, advises The INDIA RUBBER WORLD that it has been completely cut off from its source of supplies for the present. This agency informs us that the factory is running fully, the output being required for government use. It is hoped soon, however, to have government permission for the continuation of export of rubber goods from Russia.

On December 1 there was in bonded warehouses in New York 348,974 pounds of chicle, valued at \$117,903; manufactures of gutta percha to the value of \$91,419; india rubber manufactures worth \$70,878, and of elasticon \$606. The records for December 1, 1913, give the value of chicle in bond on that date \$63,976; manufactures of gutta percha, \$86,750; manufactures of india rubber, \$45,440.

The Vulcanized Rubber Co., of Morrisville, Pennsylvania, which manufactures hard rubber goods, is increasing its plant by the addition of a building for the storing of scrap rubber.

The Canadian government has forbidden the export of rubber from Canada to any country other than part of the British empire. The commerce of Canada in rubber goods has in the past amounted to about \$4,500,000 annually, of which amount exports have represented approximately \$500,000.

On December 1 the Federal Rubber Manufacturing Co., of Milwaukee, Wisconsin, announced a reduction in price on its rugged tread tire casings, in sizes from 30x3 inches to 36x5 inches, amounting to from \$4.40 to \$7.95 per tire.

Fire recently damaged the storehouse of the Converse Rubber Shoe Co., of Malden, Massachusetts, to the extent of about \$10,000, a loss fully covered by insurance.

The Gilney Tire & Rubber Co., of 250 West Fifty-fourth street, New York, has reduced its capital stock from \$100,000 to \$50,000.

The offices of the New York Shield Co., which manufactures the "Amolin" shield, were removed on December 1 to 19-25 East Twenty-fourth street, New York.

Some good-sized contracts for fire hose have recently been awarded in western cities, The B. F. Goodrich Co., of Akron, Ohio, having secured an order for 9,000 feet from the fire department of Minneapolis, Minnesota; the Manhattan Rubber Manufacturing Co., of Passaic, New Jersey, a contract for 5,000 feet from the city of St. Paul, Minnesota, and the C. C. C. Fire Hose & Rubber Co., of Canton Junction, Massachusetts, an order for 1,000 feet to equip the department at Eau Claire, Wisconsin.

The Habirshaw Wire Co. has removed its sales office to its general headquarters at Yonkers, New York.

The Franco-American Rubber Cloth Co. has opened a factory at Como, New Jersey.

On and after January 4, 1915, The Charles T. Wilson Co., Inc., of New York City, will maintain an office at Room 507, Second National Building, Akron, Ohio, in charge of Henry Perlish, vice-president of the company.

NEW INCORPORATIONS.

Anderson Pneumatic Spring & Tire Co., November 27, 1914; under the laws of Delaware; authorized capital, \$1,000,000. Incorporators: William W. Anderson, George A. Rock and Samuel T. Dorsett—all of Washington, D. C. The company is to acquire and take over from James C. Anderson, of Washington, D. C., an exclusive license granted by the United States, so far as it relates to pneumatic springs, starters, brakes and tires for automobiles and other vehicles.

Anti-Puncture Corporation, December 9, 1914; under the laws of New York; authorized capital, \$20,000. Incorporators: Chas. H. Stanton, 105 Beverly Place, Brooklyn, New York; Myra Emmons, 804 West One Hundred and Eightieth street, and Sidney V. Morris, 302 West Twenty-second street—both in New York City. To manufacture compositions for preventing punctures in tires, etc.

Bucyrus Rubber Co., The, December 2, 1914; under the laws of Ohio; authorized capital, \$150,000. Incorporators: G. B. Smith, Jay Taylor, H. B. Stewart, Ed. L. Smith, and Isaac H. Taylor. To manufacture and deal in rubber goods.

Community Rubber Co., November 20, 1914; under the laws of New Jersey; authorized capital, \$25,000. Incorporators: P. S. Martinett, J. R. D. Bower and H. S. Allen—all of Trenton, New Jersey. To manufacture, purchase, sell and deal in all kinds of rubber goods and articles in which rubber is a part.

Dixie Tire & Rubber Co., October 3, 1914; under the laws of New Jersey; authorized capital, \$10,000. Incorporators: Carrie M. Downing, Charles J. Downing—both of Vaux Hall—and Frederick B. Taylor, South Orange—all in New Jersey. To deal in and sell automobiles, vehicles and accessories of every kind.

Dujardin Rubber Co., Inc., December 7, 1914; under the laws of New York; authorized capital, \$100,000. Incorporators: Henry Dujardin, 3303 Glenwood Road, Brooklyn, New York; Frank B. Hutcheon and Frank E. Hutcheon—both of 205 Avenue A, Bayonne, New Jersey. To manufacture tires, tubes, rubber goods, etc.

Eastern Tire & Supply Co., of Rochester, N. Y., Inc. December 8, 1914; under the laws of New York; authorized capital, \$5,000. Incorporators: James G. Barclay, Buffalo; Wm. T. Kineag and Arthur Smith—both of Rochester, New York. To manufacture tires and auto accessories.

Empire Wheel & Tire Co., November 9, 1914; under the laws of Alabama; authorized capital, \$2,000. Incorporators: J. W. Gannon, W. S. Webber, F. H. Elmore, Jr. Principal place of business, Montgomery, Alabama. To deal in auto tires, etc.

Ford Tire & Tube Co., The, November 14, 1914; under the laws of Ohio; authorized capital, \$10,000, divided into one hundred shares of \$100 each. Incorporators: E. E. Rodd, C. V. Liggett, U. L. Henzy, C. A. Levy and Lee Ulmer. To manufacture and sell rubber tires and tubes for automobiles.

Germantown Almegum Manufacturing Co., July 15, 1914; under the laws of Pennsylvania; authorized capital, \$10,000. Incorporators: John Axford, 343 E. Chelten avenue; William B. Keefer, Newport Apartments; Frank M. Camp, 321 Lincoln avenue, and J. L. McGiehan, 405 Lexington avenue—all in Philadelphia, Pennsylvania. To manufacture and sell mechanical rubber goods.

Gibraltar Tire & Tube Co., December 16, 1914; under the laws of New Jersey; authorized capital, \$100,000. Incorporators: Harry L. Brown, William Seale, Randolph Bradshaw and Raymond Brown—all of Newark, New Jersey. To manufacture and sell automobile tires, tubes and rubber of every character and description.

Gillette Safety Tire Co., The, November 21, 1914; under the laws of Maine; authorized capital, \$1,000,000. Incorporators: Albert F. Jones, T. L. Groteau, A. B. Farnham, Clarence G.

Trott—all of Portland, Maine. To sell and deal in rubber or similar substances.

Great Eastern Rubber Co., November 19, 1914; under the laws of Pennsylvania; authorized capital, \$100,000. Incorporators: Charles R. Fluck, Daniel M. Knabb—both of Allentown—and Van A. Nagle, Easton—all in Pennsylvania. To manufacture and sell rubber tires and other articles of commerce of which rubber is an ingredient.

Johnson Pneu-Metal Tire Co., October 2, 1914; under the laws of Massachusetts; authorized capital, \$1,000,000. Incorporators: Fred I. Johnson, Prospect street, Fitchburg; James H. Duffy, 18 Tremont street, and William P. Meehan, Boston—all in Massachusetts. To manufacture and deal in tires, etc.

McClurg Rubber Co., The, November 23, 1914; under the laws of Ohio; authorized capital, \$250,000. Incorporators: John S. McClurg, James L. McClurg, Wm. Z. Davis, W. A. Hinebaugh and O. D. Tucker. To manufacture, sell and buy at wholesale and retail rubber tires for automobiles.

Mircho Specialty Co., Inc., December 16, 1914; under the laws of New York; authorized capital, \$3,000. Incorporators: Arthur C. Squires, Keyport, New Jersey; Jacob A. Lewis, 4633 Park avenue, New York, and Paul H. Allen, 45 West Thirty-fourth street, New York City. To manufacture rubber goods.

Motor & Tire Sales Co., December 14, 1914; under the laws of Delaware; authorized capital, \$100,000. Incorporators: Herbert E. Latter, William J. Maloney, Oscar J. Reichard—all of Wilmington, Delaware. To manufacture and deal in automobiles, motor cars, etc., as well as to repair tubes and automobiles.

Overman Cushion Tire Co., Inc., December 2, 1914; under the laws of New York; authorized capital, \$150,000. Incorporators: Mac C. Overman, 250 West Fifty-fourth street; Charles A. Tausig, 220 Broadway, and Wm. R. Lowther, 43 Cedar street—all of New York City. To manufacture tires, rims and other auto accessories.

Para Products Co., Inc., The, September 10, 1914; under the laws of New Jersey; authorized capital, \$5,000. Incorporators: Jacob Schreiber, 149 Broadway; Alfred Epstein, 1777 Broadway, and Frank Brown—all of New York City. To manufacture, purchase and sell rubber goods and all goods of which rubber is a component part.

Pines Rubber Co., Inc., December 16, 1914; under the laws of New York; authorized capital, \$1,000. Incorporators: Jos. Pines, 1221 Forty-second street; David Pines, 364 Hopkinson avenue, and Morris Pines, 1254 St. Marks avenue—all of Brooklyn, New York. To manufacture raincoats, rubberized materials, etc.

Searle Unburstable Inner Tube Co., Inc., The, December 9, 1914; under the laws of New York; authorized capital, \$400,000. Incorporators: Frederick H. Hall, Hotel Astor; Orson Kilborn, 316 West Seventy-eighth street, and J. Campbell Thompson, 63 Wall street—all of New York City. To manufacture inner tubes and tires, etc.

Service Tire & Rubber Co., October 14, 1914; under the laws of Maryland; authorized capital, \$10,000. Incorporators: James L. Clifford, Joseph W. Clifford, James J. Filon, J. W. Evans and Catherine Clifford—all of Baltimore City, Maryland. To manufacture, purchase, sell, repair and otherwise deal in rubber and rubber goods of all kinds, and especially tires of every character and description.

Three Star Tire Co., December 10, 1914; under the laws of New Jersey; authorized capital, \$50,000. Incorporators: Edward H. Steel, 1102 West State street; Archibald F. Updike, 240 East Front street, and Richard G. Whitehead, 921 Berkley avenue—all in Trenton, New Jersey. To buy, sell and deal in rubber tires and tubes, etc.

Stern Co., David F., November 5, 1914; under the laws of New York; authorized capital, \$5,000. Incorporators: David F. Stern,

210 West Forty-fourth street; J. H. Halfbey and Isidor Lobatto—both of 1053 Southern Boulevard—all in New York City. To deal in boots, rubber shoes, etc.

Wire Tire Co., November 28, 1914; under the laws of Delaware; authorized capital, \$1,000,000. Incorporators: John S. Lyons, 412 North Main street; George L. Brown, 40 North Main street; both of Wilkes Barre; and Thomas A. Zukoski, Plymouth, all in Pennsylvania. To manufacture and sell automobiles, automobile tires, rims or accessories.

X Protectyre Co., Inc., The, November 21, 1914; under the laws of New York; authorized capital, \$20,000. Incorporators: Isidore Neustaedter and Hyman J. Rosenbloom—both of 63 Park Row; and Alfred Alexander, 50 West One Hundred and Eleventh street—all of New York City. To manufacture tire protecting devices and other auto accessories.

BUSINESS ACTIVE WITH CONVERSE CO.

According to its monthly statement for November, the Converse Rubber Shoe Co., of Malden, Massachusetts, is making 9,000 pairs a day against 6,000 pairs in November, 1913. The company having refused to bid on foreign orders for this season, the increase is solely attributable to home demands. It has been found necessary to operate many departments night and day.

TRADE NEWS NOTES.

Rubber footwear prices, which for the past two years have been announced in January, and prior to that time were published in April, are not yet ready. The "Boot & Shoe Recorder," in its issue of December 12, states that new price lists will be issued March 1.

At the meeting of the Retail Shoe Association of Louisville, Kentucky, the subject of profits to be obtained on rubbers was discussed, some dealers maintaining that rubbers selling at wholesale for 65 cents per pair should be retailed at \$1.25, while others claimed that a price of \$1 per pair—which would give the dealer a profit of 31 per cent. on the selling price and of 44 per cent. on the cost price—would encourage the public to buy more freely.

Large orders are being received by Canadian manufacturers for rubber shoes for the Allied armies. The Canadian Consolidated Rubber Co., Limited, of Montreal, has received an order for over 60,000 pairs of two-buckle arctics, through representatives of the British government, and practically all the rubber shoes in stock at the warehouse of this company and the branch in that city of the Gutta Percha & Rubber, Limited, have been bought for immediate shipment.

The Loewenthal Co. has removed its New England office from Chelsea, Massachusetts, to 161 Summer street, Boston.

The plant of the Leicester Rubber Co., at Catasauqua, Pennsylvania, damaged by fire last summer, was sold by the receivers on November 24 at \$5,900, the machinery bringing \$4,800 and the site and what remains of the building \$1,100.

Fire recently damaged the plant of the United States Rubber Reclaiming Co., at Buffalo, to the extent of about \$75,000. This plant was valued at \$1,000,000, and the fire is supposed to have been caused by spontaneous combustion.

The United States Rubber Co. has opened a new branch store at Indianapolis, Indiana, in charge of J. H. Hassett, formerly of the Banigan Rubber Co.'s Chicago force and also at one time connected with the New England Rubber Shoe Co., at Boston.

Fred Becht, who for a number of years was connected with the Goodyear's India Rubber Selling Co., has been appointed manager of the Maumee Rubber Co., at Toledo, Ohio.

An organization known as the Federal Goodfellowship Club, composed of employees of the Federal Rubber Manufacturing

Co., of Milwaukee, was instrumental in bringing Christmas cheer to a number of the less fortunate of that city during the holidays. This club had envelopes distributed among the employees on pay days for some time prior to Christmas, and each contributed what he could conveniently spare toward the cause.

The regulations under schedule B of the Emergency Revenue law, operative on and after December 1, 1914, provide that on chewing gum or substitutes therefor stamps must be affixed by the manufacturer before packages leave the factory, at the rate of 4 cents for every dollar's worth of gum at retail price; and that a label showing the number of tablets in the package with the retail price of each tablet, must also be affixed.

The Plymouth Rubber Co., of Canton, Massachusetts, has recently contracted with the Edison Electric Illuminating Co., of Boston, for a supply of energy equal to about 1,000 horse power for 24 hours per day, and amounting to about \$40,000 a year.

An announcement has been received to the effect that Messrs. Harold van der Linde and Victor van der Linde have severed their connection with the Century Rubber Co., of Plainfield, New Jersey.

Some interesting figures have been compiled by the Federal Rubber Manufacturing Co., of Milwaukee, Wisconsin, in regard to its output of tires for baby carriages. The quantity of this material sent out from the factory in October was sufficient to equip 88,000 baby carriages, which, at 12 feet of tire per carriage, would require 1,056,000 feet, or 200 miles.

A ruling of the Circuit Court of Appeals in the case of the L. E. Waterman Co., of New York, against the Modern Pen Co., both manufacturers of fountain pens, has been affirmed by the Supreme Court, which holds that there is no proprietary interest in the name Waterman, and that the Modern Pen Co., with which Arthur A. Waterman is associated, may mark its wares "Arthur A. Waterman & Co." Not connected with the L. E. Waterman Co.

The rubber stamp making establishment of R. A. Stewart & Co., Inc., at 203 Broadway, New York, was severely damaged by the fire which recently destroyed the three upper floors of the five-story building at that address.

The B. F. Goodrich Co., of Akron, is one of the rubber concerns that has profited from the season's big grain crops, having filled a great many orders for their "Longlife" and "Maxecon" conveyor belts for use in western elevators. Some of these belts are 715 feet long and 40 inches wide.

A meeting of stockholders of the Northland Rubber Co., Inc., which manufactures pneumatic tires and tubes, was held at the company's office at 703 Northland avenue, Buffalo, on November 17, when the following directors were elected: B. L. Jones [president]; G. C. Riley [secretary], and C. O. Henderson, for three years each; W. F. Kasting [vice-president], H. D. Miles and C. L. Ingham, for two years each; J. E. Ferguson, C. B. Hill and J. Jolly [assistant treasurer] for one year each.

The El Paso Rubber Vulcanizing and Auto. Supply Co., of El Paso, Texas, has filed certificates of dissolution.

A convention of the National Foreign Trade Council, of which James A. Farrell is chairman, will be held at the Planters' Hotel, St. Louis, Missouri, January 21 and 22.

The Motor Truck Club of America held its annual meeting and banquet on Wednesday evening, December 16, at the Automobile Club of America, New York. The club now has 344 members, representing all the various industries associated with truck manufacture and operation, its membership including 15 tire manufacturers and 9 tire salesmen. At this meeting George H. Duck, of the Sewell Cushion Wheel Co., was elected a director for a three-year term.

THE RUBBER TRADE IN AKRON.

By J. J. Anderson, Correspondent.

THE 10 per cent increase in freight rates granted Eastern railways December 18 by the Interstate Commerce Commission will result in stimulating the local rubber trade, was the statement made, when interviewed, by F. A. Seiberling, president of the Goodyear Tire & Rubber Co.; H. S. Firestone, president of the Firestone Tire & Rubber Co.; W. A. Means, treasurer of the B. F. Goodrich Co., and other officials of Akron rubber companies. When conditions are normal the railroad companies place big orders for rubber hose, belting and other supplies, but during the past year they have ordered only rubber supplies to meet emergency requirements, according to leading officials of the local companies. That the new year will usher in another era of prosperity is the general impression in local rubber circles. All the manufacturers are preparing to meet the demand for Akron products that they feel confident is sure to come.

But Akron rubber men view with some alarm the continued deadlock between England and the United States Department of State over the embargo placed on all crude rubber from the East. While practically all of the Akron companies have a fairly large supply of crude rubber in stock, they are forced to depend almost entirely upon the Brazilian product and this source of supply, it is feared, may prove inadequate if the embargo on the Eastern product continues for an indefinite length of time. In the face of the large volume of business which Akron companies are preparing to handle during the early months of 1915, a short supply would prove a serious handicap.

* * *

On the strength of rumors that the annual reports of The B. F. Goodrich Co. will show earnings of more than \$6,000,000 on common stock, an unusually heavy demand has been created during the past month for shares. Holders of the stock at the present time are at least \$5,000,000 richer than they were a month ago, and indications are that it will go even higher before the next annual meeting. Much attention has been attracted to the increased demand, created originally by Eastern investors, for Goodrich shares, and local brokers predict that they may reach \$30 before the first of February.

Goodyear and Firestone stocks have also been actively traded in during the month by local investors.

* * *

Perhaps the most interesting news of the month in local rubber circles was the report at the annual meeting of stockholders of the Goodyear Tire & Rubber Co. that the common stock had earned 36 per cent. during the year ending October 31, 1914. Despite the war in Europe and the general business depression, the company reported the most prosperous year in its history and the figures in the company's books presented at the meeting bore out this statement. The net earnings for the year were \$3,391,000; the cash on hand \$2,862,000; the unappropriated surplus \$4,052,000, which equals 40 per cent. of the common stock of the company. The stockholders re-elected the directors—F. A. Seiberling, C. W. Seiberling, G. M. Stadelman, F. H. Adams, P. W. Litchfield, H. H. Manton and J. P. Loomis.

Of interest to the rubber trades was the Akron Automobile & Electrical Show, the first of its kind in this city, held from December 12 to 19. Practically all of the local rubber companies exhibited, in addition to a showing of the products of the leading automobile and accessories manufacturers of the United States. The exhibits represented a value of more than \$300,000. Nearly 50,000 people visited the exposition.

A permanent organization to promote a similar show each year has been effected and the substantial support given the promoters this year will enable them to begin 1915 with a surplus. A modest dividend was declared on the first show. The members of the organization are E. T. Jones, Andy Auble, Jr., C. C. Welker, G. W. Funk and W. L. Stouffer.

F. A. Seiberling, president of the Goodyear Tire & Rubber Co., visited Washington late in December and called on President Wilson. He went to the British Embassy, armed with a letter of introduction from the White House, and had a talk with Sir Cecil Spring-Rice, the British Ambassador. Later, he said that he was going to London to lay his protest before the British government.

* * *

Additions under course of construction to the Firestone plant, which will be ready for occupancy early in 1915, will give this company more than 100,000 feet of additional floor space. At least 10 per cent. more men are being employed than in the closing months of 1913, according to President H. S. Firestone. Reports made at the annual meeting a few weeks ago showed sales for the fiscal year in excess of \$20,000,000.

* * *

The Rubbertown Tire Co., of Akron, has been incorporated, with a capitalization of \$10,000. The incorporators include O. J. Schwab, local crude rubber man; J. F. Darcy, a New Yorker, and N. M. Greenberger. It was stated today that those interested are not connected with other rubber interests, and that the company will be an independent concern.

* * *

The "Made in Akron" show, which was to have been staged in this city early in January, has been postponed until later in the year. Many of the largest concerns intending to exhibit were Akron rubber companies, and their officials believed that a better showing could be made if more time was given to preparation.

* * *

An order of the Ohio State Board of Public Works increases the rates to local rubber companies using water from state lakes from 3 to 5 times the rate paid in past years. This increase will cost the companies more than \$25,000 per year.

* * *

The purchase of a site in the business section of the city last month paves the way for the erection of a community garage in which Akron rubber men are interested financially.

Owing to the increase in the number of automobile tire users in Akron many of the big tire concerns, including the Goodrich, Goodyear, Firestone and Miller companies, have established service stations for the convenience and benefit of their patrons.

* * *

Photographs of the interior of the new mansion erected by H. S. Firestone, president of the Firestone Tire & Rubber Co., have been taken for the Tiffany Studio—which directed the work of interior decorating—and will be reproduced in several of the leading magazines of the country.

Mrs. B. G. Work, wife of the president of The B. F. Goodrich Co., has ordered 50 dozen pairs of socks from a Detroit knitting company, to be delivered to the Vacation War Relief Society, which is collecting supplies for the Allied soldiers at the front.

Mr. C. B. Raymond, secretary of the Goodrich company, is in California on a tour of inspection of the company's branches through the West.

Mr. Frank Sell, of the Goodrich office, has been transferred to the company's branch at Omaha. Mr. Sell and his family left last week for the Nebraskan city, where he will begin his work January 1.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

SPEAKING broadly, at present writing, four days before Christmas, there is no rubber trade in Boston. Rubber men in all lines except those influenced by the weather are far from enthusiastic regarding business conditions. Business is generally dull in these lines the latter part of December, and this year shows no exception but rather an emphasized condition of inactivity. Automobile tire makers are running their works to reduced output. Mechanicals are in retail rather than wholesale demand. There was a good call for druggists' rubber goods up to last month, since which time trade has fallen off. The manufacture of rubber soles and heels is active, for shoe manufacturers are using many of these in place of high priced leather. The greater part of the month of December, like the previous one, has been too mild and too dry to give any impetus to the clothing and footwear trade, but the long-looked-for snow started the Monday before Christmas, with the effect of immediately stimulating these lines of the rubber trade.

There is considerable talk, hereabouts, of the possibility of capturing orders for several hundred thousand pairs of rubber boots for the armies of the Allies in the field. Just now there are hints that a certain firm of exporters is "nearly ready" to place orders for these boots, and its agents have secured samples and prices from several of the rubber manufacturers. All the manufacturers seem to know about it but under pledge of secrecy refuse to give out any information. That large shipments have already been sent to Great Britain from this port and New York is a well-authenticated fact. That such large orders as mentioned above may be placed is not so assured a fact. But there is no doubt that the soldiers now in the trenches need waterproof and cold-proof footwear, and while there are large manufacturers of rubber boots in England and Russia, there may be a good opportunity for American rubber shoe manufacturers to supply a portion of the demand.

Apropos of this, some of the rubber footwear manufacturers received inquiries whether they can furnish 100,000 pairs of short boots, and on what terms. This has led to the discovery that no company is "long" on short boots, and it is rather doubtful if that number of such boots could be found in the factories or jobbing houses of the entire country. In spite of the comparative mildness of the season, and the fact that the factories made nearly or quite their full quota of advance supplies, the shipments out of the country, and the demands of the regular trade, have reduced the stocks of floor goods to comparatively small proportions.

It is reported that some agents of foreign governments are now in this country trying to buy heavy shoes of leather for army wear; that some of them have been unable to make satisfactory arrangements for such supply, and that they are now investigating rubber-sole leather-upper footwear, similar to hunting boots, as a substitute for the leather shoes.

* * *

The B. F. Goodrich Co., of Akron, has for a long period had a branch selling agency on Boylston street in this city, where its tires were sold. Last month the company established an agency at this location for the sale of its "Hipress" footwear. Mr. F. T. Moore, the regular branch manager, will have general supervision over the agency.

* * *

We had a dog show in Boston the first week in December, and as this was somewhat of a "society" affair, it was attended by "many of the best families." Although the principal exhibits were dogs of many varieties, perhaps the greatest attention was attracted to six pairs of rubber boots. These boots were not of the standard variety, however, but were made to order for "Babykins," "Tiny Tim" and "Toy," three dogs of aristocratic pedigree, and were worn by the canine pets so they

wouldn't get cold feet. This may start a fashion which will help out the rubber footwear industry in dull seasons.

* * *

Mr. Thomas A. Forsyth, of the Boston Belting Co., has been appointed a trustee of the Boston City Hospital, to take the place made vacant by the resignation of Dr. Dowling, who had been its superintendent.

The Hubmark Rubber Co., which succeeded to the rubber shoe business of Laakin & Foster, in this city, and took the store on Congress street which that firm had occupied for many years, has removed to one of the upper floors at 207 Congress street, where it will be located until next spring. At that time it will probably occupy a building on Summer street extension, near the present stores of W. E. Mayo & Co., The Congress Shoe & Rubber Co. and the Regal Shoe Co. This business is under the management of Chester J. Pike, Jr., son of C. J. Pike, for many years prominently connected with the United States Rubber Co.

THE RUBBER TRADE IN CHICAGO.

By Our Regular Correspondent.

GENERAL conditions in the local rubber trade show a great improvement over those of a month ago. Trade holds about the same. The volume of business in tires and all the articles which compose the mechanical rubber line has been satisfactory. The season has been open until the last two weeks, and automobiles remained out much longer than usual. During the past two weeks there has been a great demand for rubber clothing, with dealers anxious for the goods they would hardly look at a few weeks ago.

* * *

Proprietors of rubber clothing stores robbed one after another in rapid succession about a year ago, last week received some light on the operations of the gang that did the looting. Several of the band, who were found guilty and sentenced to prison terms, were brought back to the city to testify in a sensational police graft scandal. One of them states that the gang worked under police protection, and that the officers even assisted them in some of the robberies. They would drive a wagon up to the rear door of the store and make away with all the contents, in many instances leaving nothing but the fixtures. The property would then be sold from wagons in the slums of the city, valuable raincoats, boots and overshoes being passed out at sacrifice figures. When an honest officer interfered the crooks would submit to arrest, to be later set free by higher officials who were getting a part of the profits. The Goodyear Raincoat Co., which has stores at several locations in the loop district, was a frequent victim.

* * *

J. E. Duffield, district manager of the Thermoid Rubber Co., of Trenton, New Jersey, states that the company is closing one of the most successful seasons in its history. Business on all lines has been rushing. On the first of the new year J. H. Liston becomes manager of the Detroit branch which this company has established. Mr. Liston is well known in the local rubber trade, and while his work in the northern city will be of a pioneer nature great things are expected of him. O. C. Hendry, who was formerly of the Texas branch of the Fisk Rubber Co., of Chicopee Falls, Massachusetts, on the same date became northwestern representative of the Thermoid company.

* * *

Henry Spadone, president of the Gutta Percha & Rubber Co., New York, was a prominent visitor to the city during the month. F. McCullough, of the local branch, states that the business of the company for the year just closing has been entirely satisfactory, and has shown a marked expansion in many lines, particularly belting and packing.

The Goodyear Tire & Rubber Co., which moved some time ago to a new location at 1601 South Michigan avenue, has been doing a rushing business for the past month. An advertising feature which deserves mention is a large tire, said to be the largest ever made, which is being displayed in the window. The tire measures 48x8 inches, and is of the pneumatic type.

* * *

There is to be a meeting of the organizations interested in promoting good roads throughout the state some time during the next few weeks, to be held at the Hotel La Salle, in which many prominent State officials are expected to take part. Tire and automobile concerns are much interested in the movement.

The retail trade during the holiday season has been very satisfactory, especially on all rubber novelties. "Kewpie" dolls of red rubber are very popular, and one firm reports a fine business on this item alone.

* * *

Trade paper advertising was given a direct boost in a recent address by John Allen Underwood, the well known advertising expert, at a luncheon of the Executives' Club held at the Hotel Sherman. Mr. Underwood declared that the secret of success in advertising lay in concentration, especially where the appropriation of the advertiser was limited. The retailer, he said, should be the center of advertising, as he is the center of distribution.

THE RUBBER TRADE ON THE PACIFIC COAST

By Our Regular Correspondent.

CONDITIONS in the rubber trade on this coast are satisfactory to the trade, the business for the fall season showing an increase and excellent prospects. The demand for tires is constant and develops with the increase in the number of motor vehicles in use. The extent to which automobiles are used in this section is shown by the fact that in a statement of expenses incurred by a candidate in the recent elections the item for tires alone amounted to \$213. In addition there are many motorcycles, the number of these registered on December 1 being 24,379.

* * *

The Universal Tire Co. expects to have its factory at Anaheim, California, ready for operation early in January, employing about 200 men at the start and equipped to turn out about 100 tires a day. This factory is three stories high, 80x200 feet in area.

* * *

The tire and accessory dealers of Fresno, California, have formed an organization known as the Fresno Automobile Tire & Accessory Dealers' Association. This association was started with 30 members, and will hold monthly meetings.

* * *

H. A. Thompson, who has been succeeded in the management of the Spokane branch of the United States Rubber Co. by E. A. Griffith, has assumed similar duties in connection with the Seattle and Tacoma branches of the same company.

* * *

Ed. S. Campion, for the past six years manager of the factory branch of the Firestone Tire & Rubber Co. at Seattle, and for seven years previous a member of the Firestone sales force, has severed his connection with that company to become sales manager of the Marathon Tire & Rubber Co. of Akron. He has been succeeded by C. W. Brown, former manager of the Firestone San Francisco branch.

* * *

W. H. Bell, for the past three years manager of the Firestone Tire & Rubber Co.'s branch at San Francisco, has gone over to the Kelly Springfield Tire Co. as general Pacific coast sales manager, with F. H. Hearsch as assistant and general repre-

sentative. C. A. Jessup has been appointed manager of the Los Angeles branch of the company.

* * *

C. H. and T. C. Jones, the former of whom has been for the past two years connected with the Seattle branch of the Republic Rubber Co., of Youngstown, Ohio, have established a Republic agency at Tacoma, Washington.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

BUSINESS in Trenton, in the rubber and associated industries, shows no decrease in activity; and that general prosperity exists is evidenced by the generous response to the numerous appeals that have lately been made for contributions for the relief of war sufferers and for the various local philanthropies. About \$9,000 has so far been sent from this city for war relief, in addition to supplies of considerable value. More than \$5,000 of this amount was collected for the Belgian Relief Fund, and about \$3,000 for the British Isles Relief Association. The Poor Children's Christmas Fund has had particular interest for the rubber trade, and has been contributed to generously. The workmen of the Thermoid Rubber Co. have given quite freely to this fund, as they have done in previous years, and donations were also made by the Katzenbach & Bullock Co., Inc., dealers in chemicals for the rubber trade. The United & Globe Rubber Manufacturing Cos. made a contribution of \$25 to the Trenton Poor Relief Fund, and Ferdinand W. Roebeling has given \$12,500 to the Ewing Presbyterian Church in Trenton, of which \$500 annually will be at the disposal of the board of trustees.

* * *

The fire department of the city has submitted some comparative figures on the cost of operating motor drawn fire apparatus as compared with that previously used. The report shows a saving of \$57.35 and \$61.26 respectively, in one month's operation of two engines.

* * *

The Three Star Tire Co. has been incorporated here, with a capital stock of \$50,000, to deal in rubber tires and tubes. Edward H. Steel, Archibald F. Updike and Richard G. Whitehead are the incorporators and promoters of the new concern, which is located at 19 South Montgomery street.

* * *

Another tire manufacturing concern has located in Trenton, at Mulberry street and New York avenue. The property at this address, formerly occupied by the American Lamp & Brass Co., has been purchased by the Mecca Tire Co., of Philadelphia, and is being remodeled and improved for tire manufacturing purposes. This property covers about three acres and contains six brick buildings, each 30x90 feet, five of them 2½ stories high and one of 3½ stories. These will be equipped with the necessary modern machinery to turn out from 250 to 300 tires per day, and give employment to about the same number of workmen. George E. Knowles, of Carteret, at one time employed by the Thermoid Rubber Co. and later connected with the Chester Rubber Tire & Tube Co., of Chester, West Virginia, will be general manager of the new concern, whose officers are: Charles Buckley, president; William Fullerton, treasurer; W. J. Cassidy, secretary. The plant will not be ready for operation before March 1.

* * *

The De Lion Tire & Rubber Co., whose plant was mentioned in the June number of THE INDIA RUBBER WORLD as being under construction, will commence operation about January 1, turning out a line of automobile tires and tubes. This company is offering a prize of \$25 for the best slogan offered for use in adver-

tising its products as a trade mark—some distinctive term that will apply particularly to the goods and at the same time suggest that they are of Trenton origin. Suggestions should be sent to the Slogan Contest department of the Chamber of Commerce.

* * *

John E. Thropp, of the John E. Thropp's Sons Co., has been elected director for a three-year term of the Carroll Robbins Civic Association, one of Trenton's prominent organizations.

* * *

The Mattson Rubber Co. of New Jersey was incorporated on November 12, succeeding the Mattson Rubber Co. of New York, whose thirty year charter expired by limitation on that date. The capital stock is \$200,000, the principal office is situated at Lodi, New Jersey, and the officers are: John Behrens, president; H. Lemmermann, vice-president; J. H. Behrens, secretary and treasurer. The Mattson Rubber Co. was started in the 40s by Dr. Morris Mattson. It has for many years specialized in the manufacture of unguaranteed tire casings, also manufacturing a complete line of automobile rubber accessories and raw stocks for all purposes. During the past year the capacity of the plant has been increased by over 50 per cent. through the erection of a modern addition.

* * *

Fire broke out on December 16 in a new shop of the insulated wire factory of the John A. Roebbing's Sons Co. in this city, but little damage resulted, the company's own fire corps extinguishing it with little difficulty.

* * *

The Overman Cushion Tire Co. has been incorporated with a capital stock of \$150,000 to succeed the Overman Tire Co. now in the hands of receivers, and has temporarily located at Belleville, New Jersey, with office and salesroom at 250 West 54th street, New York, the old factory at Passaic having been given up. The new concern will manufacture only the Overman cushion tire, discontinuing the pneumatic type. The officers of the company are: C. A. Taussig, president; J. B. Bleiler, vice-president and sales manager; Mac C. Overman, treasurer and general manager; Alexander Clogher, secretary.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE rubber factories throughout the district are at present working fully 85 per cent. of their capacity, according to the latest reports, and there appears to be a promising outlook for a continuance of this condition or better throughout the winter. Although some anxiety was entertained at the announcement of the recent embargo on crude material, the local factories have so far escaped its effects. Most of the Rhode Island plants were fortunate in having fairly large stocks of goods and material on hand.

The early snows in northern New England, New York State and across the Lake Regions have caused a rush of work for the local factories manufacturing rubber shoes and boots, and it is predicted that there will be a good trade throughout the Winter. All of the manufacturers unite in saying that the outlook has greatly brightened since the first of the month and that the orders which are now coming in will keep the plants running close to full time until spring. Already some of the factories are behind on their deliveries from two to four weeks.

One of the most important, as well as most interesting, rumors in connection with the local rubber trade is the announcement made a few days before the Christmas holidays that Providence is to have the largest plant in the world for the production of solid motor tires. This does not mean the opening of a new plant, but will be one of the effects of another step in the policy of concentration and specialization to be taken by the United States Tire Co. beginning with the new year. At that time the manufacture of automobile tires will be discontinued

at the plant of the Revere Rubber Co., which is the local branch of the United States Tire Co., and instead the making of solid tires for motor trucks, carriages and vehicles of all sorts will be concentrated at this plant, each of the three other plants of the United States Tire Co. now making solid tires as a part of their general line abandoning this line to the Providence plant.

* * *

Waste heat boilers have been installed recently in the open hearth department of the Washburn Wire Co. at Phillipsdale. The installation consists of two large vertical boilers which will utilize the heat now passing to the stacks. The waste gases from the open hearth furnaces will be drawn through the tubes by large fans placed at the top of the boilers and then will pass on to the stacks. It is estimated that 350 horsepower will be generated by each boiler at maximum capacity. This installation is in line with recent endeavors of manufacturers all over the country to utilize waste heat. It is expected that the first of these boilers will be put in operation at an early date, and that later, if they prove satisfactory, a similar installation will be made at the reheating furnaces.

* * *

A new dancing shoe made by the National India Rubber Co. at Bristol has been the subject of numerous experiments, especially in the construction of the heel. The new heel, which is to be molded, will have the appearance of a solid mass of rubber, but the center is actually hollow, thus reducing the weight.

The factory is planning to increase its tennis shoe department. The daily output of tennis shoes at present is 30,000 pairs. The Auburn Foundry Co. is making new machines to be used in the manufacture of tennis shoes, and part of the new equipment has already been received at the plant. Necessary improvements are being pushed as rapidly as possible, and it is expected that the changes will be completed in the near future.

Andrew W. Anthony, associated with the National company, has been appointed by Governor-elect R. Livingston Beeckman as a member of his personal staff with the rank of Lieutenant Colonel. Mr. Anthony is a son of the late S. Reed Anthony, of Boston, and married Miss Primrose Colt, daughter of Senator LeBaron B. Colt and niece of Col. Samuel P. Colt, president of the United States Rubber Co.

The National employees subscribed nearly \$100 for the poor children of the town of Bristol, to be distributed for Christmas cheer.

* * *

Indications at the Alice Mill of the Woonsocket Rubber Co., of Woonsocket, point to an active winter. For the first time in many years the management omitted the annual shutdown of a fortnight or more during the holiday season, during which time an inventory of stock is usually taken. Instead the plant will only close for three or four days around New Year's to take stock. In view of the fact that the plant employs about 1,500 hands, the announcement that work there is unusually plentiful has been received with general satisfaction by not only those employed at the factory but by those having business relations with them. Some of the orders that have caused the exceptional rush at the Woonsocket plant have resulted from the European war. But the snowstorm already referred to was more directly responsible for the activity, as it helped to deplete the rubber stocks all over the country.

* * *

Edward R. Young, who conducts a rubber business at 35 Westminster street, Providence, filed a voluntary petition in bankruptcy on November 30 in the United States District Court and was adjudged to be bankrupt. The amount of the liabilities were given at \$2,191.29 and the assets at \$5,018.51. The Revere Rubber Co., and the Boston Woven Hose & Rubber Co. are the largest individual creditors.

Transatlantic Notes.

By Our Correspondent

EMBARGO UPON EXPORTS

SINCE the war broke out rubber has been receiving increasing attention at the hands of the British government, and the embargo which was applied in the second week of November by the total prohibition of exports of the commodity from the United Kingdom. The irony of the situation lies in the fact that, whereas a few months ago the authorities were so lax about the rubber trade that the growers and dealers conceived it their duty to induce the government to declare the produce conditional contraband, the industry is now suffering from a surfeit of departmental attention. The noose has been gradually drawn tighter, and now there is grave danger that unless the restrictions are shortly relaxed the rubber plantation industry will be strangled.

The various stages by which the present *impasse* has been reached were, first of all, the order that shipment from the Orient was to be confined to the Allied ports and neutral countries in Europe. Then came the declaration that rubber was to be included in the list of conditional contraband, an order that was later converted into one of absolute contraband. The next step was the resolution that plantation rubber must be shipped only to British ports, and finally came the staggering announcement that export of the commodity from this country must entirely cease. Rightly or wrongly, the trade feels that it has scarcely received fair treatment at the hands of the government, although it is recognized that at this juncture the public weal must be the paramount consideration. It is true, however, that, while the government has in all other cases affecting trade and finance conferred with the leading men in the banking and commercial world before taking action, in the case of rubber the export embargo was resolved upon suddenly and apparently without any reference to the industry concerned. The need for exhaustive consideration of the subject before taking drastic action was the more desirable in this case because of the very complex nature of the crude rubber industry. It is rightly contended that, outside rubber circles, knowledge of the trade is of a very nebulous character, hence the general feeling that importers and others should have been consulted before a measure so uncompromising and charged with such grave consequences should have been set in motion.

It is unnecessary to go into details as to the causes which have led up to the embargo, for these are doubtless fully appreciated on both sides of the Atlantic. The evidence was pretty conclusive that Germany and Austria were obtaining supplies of rubber through neutral countries. The exports of rubber from Great Britain to certain neutral countries were enormously in excess of their normal requirements. The explanation was obvious, and the government took what they deemed to be the only safe action in the circumstances. No resentment is felt at the intention to stop the trade, but only in regard to the method employed. It is thought that alternative measures might have been adopted which would have been fully as effective while inflicting less hardship upon all concerned.

As matters stand all interests will suffer by the embargo. The outlet for the producing industry will be seriously blocked, while consumers in neutral countries will be hampered by lack of raw material. In a very short space of time these factors will become acute, and the question will naturally be asked whether the interests of the many are to be sacrificed for those of the few, especially when the latter are engaged in a trade which, if not precisely illegitimate, is of a nature that may well lead to international ruptures. Viewed impartially, it is scarcely conceivable, on common sense grounds, that the legitimate consumers of plantation rubber in neutral countries will not bring

pressure to bear in the right quarters for the removal of the *embargo d'être* of the embargo. Indeed, the majority of neutrals have already done their part by prohibiting the re-export of crude rubber, and in some cases of manufactured rubber goods. But failing the necessary assurance from other quarters that the supply of raw rubber to Germany will cease, there is not the slightest doubt that the British government will not relax the present embargo one iota.

Owing to the various government restrictions issued recently, the Board of Trade returns relating to crude rubber shipments during November are of peculiar interest. In respect of both imports and exports, the latter especially, a heavy falling off is shown in comparison with the figures for the previous month. Taking imports first, it will be seen that Brazilian shipments to Great Britain fell off by more than 50 per cent. during November. On the other hand, supplies from the eastern plantation zone show a fairly big increase. In the circumstances this was only to be expected, because export to other than British ports has been prohibited. Altogether the imports have not suffered a very serious reduction and it is a moot point whether the deficiency has not been counterbalanced by direct shipment from some of the ports of origin to the consuming centers.

IMPORTS INTO THE UNITED KINGDOM.

From	1914.	
	November.	October.
French West Africa	pounds 69,400	9,100
Peru	97,600	105,700
Brazil	1,047,600	2,357,200
Gold Coast	6,400	17,800
Straits Settlements	4,565,800	3,226,200
Federated Malay States	1,700,700	2,048,400
Ceylon	2,298,800	1,675,400
Other Countries	1,459,600	2,251,300
	11,245,900	11,691,100

EXPORTS FROM THE UNITED KINGDOM.

To	1914.	
	November.	October.
Russia	pounds 1,066,500	4,703,500
Germany		
France	497,200	254,700
United States	6,599,500	8,674,100
Other countries	649,700	409,400
	8,812,900	14,041,700

The export figures are naturally more striking, but when it is considered that the embargo upon shipment from the United Kingdom came into force on November 10, it is remarkable that the falling off was not greater. Particularly is this the case in respect of shipment to the United States. Presumably the whole of the 6,599,500 pounds exported were despatched to America during the first ten days of the month. This is at the rate of about 19,798,500 pounds for the whole of November comparing with 8,674,100 pounds in the previous month.

No doubt the extraordinary shipments to the United States during the early part of the month influenced the government in their decision entirely to prohibit export. So far, the statistical position of crude rubber in this country has not been materially affected by the embargo, because stocks were already abnormally low whilst reduced imports have partially counterbalanced the decrease in exports.

RUBBER LIFE-SAVING COLLARS

The rubber life-saving collars recently mentioned as having been adopted by the British Admiralty for ships' crews, have quickly proved their efficacy. It is recorded in reference to the sinking of the gunboat "Niger" by a German submarine off the Kent coast that "all the boats except the whaler were smashed, but the men who were wearing new life-saving collars of india rubber promptly inflated them, and found the device of great service in keeping them afloat until they were picked up. Many lives were undoubtedly saved by these collars." By the way, the personnel of the Australian navy has now been fitted out with this handy and invaluable device.

It seems that the project to provide rubber boots for the British troops in the trenches in Flanders has been wet-blanketed by the War Office. The Rubber Growers' Association, which first broached the idea, determined not to be suppressed, is now making a presentation of a number of the boots for use in the trenches.

RUBBER SEIZED IN ANTWERP.

There is reason to believe that Germany did after all seize a considerable stock of rubber on taking possession of Antwerp. The quantity is estimated by some as being in excess of 1,000 tons, and it is even said that a big price was paid for it. The Antwerp market deals to a limited extent in plantation rubber, but it is chiefly identified with the Congo trade. Such rubber as was found there doubtless consisted mainly of African sorts. The market will be the better for its disappearance.

PLANTATIONS IN GERMAN COLONIES.

There is a fair number of British-owned plantation companies operating in German territory in Africa, and their position since the outbreak of war has given rise to some curiosity and uneasiness. Communication between this country and the estates has been entirely cut off for several months. Whether these plantations have been commandeered and are being administered for the benefit of the Fatherland is not known, but if there be any truth in the statement that Germany is most embarrassingly short of raw rubber supplies, the temptation to do so must be very great. Hitherto the plantations in this part of the world have always suffered from a dearth of labor, and it is not probable that the war has brought any relief in this respect. Very little *Hevea* is grown in this region, Ceara being the tree principally cultivated. One or two of the properties have been fairly substantial producers. At the meeting of one of these companies, held recently, it was stated that with rubber selling in the neighborhood of 50 cents, it was impossible to operate at a profit, and unless important economies could be effected it would be necessary to close down. To this end it has been proposed that three plantations in the district, namely, Lewa, Kamna and the German East African Co., should amalgamate, but no further steps in this direction will be possible until the termination of the war.

INCREASING PRODUCTION.

It is noteworthy that in spite of the disorganization of trade and industry throughout the world, there has been no very perceptible decline in the production of rubber. Even the prohibition of the export of rubber from the United Kingdom has not had any sensible influence upon the activity of the produc-

ing estates in the Orient. The crop returns for the month of November which have so far come to hand indicate with scarcely an exception, production on a scale larger than ever. When the war broke out in October, 1914, the crop in this country was exceptionally low, and as prices here have not given way to any material extent, there certainly appears no immediate necessity to curtail production. As bearing indirectly upon this subject it may be mentioned that modifications have already been made in the original order that all rubber produced in Ceylon, Southern India and British Malaya was to be shipped only to the United Kingdom. Permission was recently given to the Dunlop Co. to ship a certain quantity of raw rubber from its own plantations for the use of its factories in Japan, and it was further stated that direct shipment from plantation centres to Alaby-stock would be permitted.

A TAPPING RECORD.

Some interesting facts are to hand concerning the 37-year-old *Hevea* tree in the Botanic Gardens, near Colombo, Ceylon. The tree has been tapped, with short intervals, over a period of four years and nine months, and the records show that the yield during that period totaled 392½ pounds of dry rubber. The two sections of the tree on which operations were conducted were only partially tapped, and it is said that had they been completely tapped, over 550 pounds of rubber would have been secured. The yield actually obtained averages 82.6 pounds per annum, which compares well with the 4 pounds per tree commonly expected from the average plantation specimen, planted at upwards of 100 trees to the acre. It cannot be said that the tree under notice has grown under specially favorable conditions, for it stands within 5 feet of a hard road composed of laterite. The authorities have decided that tapping shall be discontinued. It is just as well for the industry that all rubber trees are not such prolific yielders of latex.

BRITISH DEMANDS FOR WAR SUPPLIES.

Orders for 12,000 cycle tires are said to have been placed with the Moseley Co., by the British War Office, while parts for 35 motorcycles have also been ordered, the destination of which has not been announced. A new military pattern of bicycle is being made for the British War Office by the New Hudson Cycle Co., of Birmingham, which is executing an order for 1,200 cycles, and is said to be sharing in the order for 3,000 placed by the Russian government.

RUBBER SHAREHOLDERS' ASSOCIATION.

The above-named association was founded in London in September, 1913, for the protection of the interests named. It did not meet with the financial support of the trade, however, and at a recent meeting the committee unanimously recommended the winding up of the association.

BRITISH TECHNICAL INFORMATION BUREAU.

The British Secretary of State for the Colonies has authorized the formation of a "Technical Information Bureau," for the purpose of dealing with inquiries from manufacturers, merchants and others in the United Kingdom and colonies, with reference to raw materials and industrial processes. A staff of experts will be in communication with producers in the colonies and users of raw materials in England.

BIG INQUIRIES FOR WATERPROOF CAPES AND GROUND SHEETS.

An inquiry has been going the round of Manchester manufacturers for 160,000 capes, each requiring 3½ yards of 60-inch proofed cloth. The entire order will require 4,200 pieces of stout twills. For ground sheets a further inquiry is anticipated at an early date, said to be the largest ever issued for the article. Ducks 36 inches wide, rainproofed, have been booked in large quantities.

Proofers are doing their best but cannot turn out half the quantity wanted.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

TRADE CONDITIONS

IN a general way there is but little alteration to record. Matters are much the same as they were two months ago, proofers, tire makers and surgical goods makers being still busy, while other departments, ministering to sports and pastimes, the general engineering and building trades, etc., are correspondingly slack. An important event, especially from the American point of view, is the embargo placed by the British government upon the export of plantation rubber to countries other than those of the Allies, the object being to prevent tires getting into Germany. The matter will no doubt be dealt with by the editor, and I shall not, therefore, enlarge upon it except by the remark that it has caused an important fall in the price of the commodity, to the advantage of our manufacturers, although nothing has been settled at the time of writing.

I imagine that before these lines are printed an amicable arrangement will have been come to with America whereby the latter's government will guarantee that no trade is done with Germany in raw or manufactured rubber, and that this will pave the way to the removal of the embargo. In the meanwhile the British manufacturers are getting cheaper rubber, and the wild rubber districts, which have been severely hit by the large output of plantation rubber, are, temporarily, at any rate, in for a better time.

A prediction which has happily been falsified in the event was a period of national distress owing to the effect of the war on industries. As it turns out, poor relief and unemployment is less than it was two years ago, and in some localities distress committees instead of looking after the unemployed are acting as labor recruiting agencies. This results from the drain of labor by recruiting coupled with the vast army contracts, which have made towns like Sheffield, Leeds, Northampton and Dundee so busy. The cotton trade has not benefited to any great extent, and the £700,000 worth of government work that has come to Manchester relates to various industries of which rubber is one of the most important.

A legal case of considerable importance, which has been decided in the high court, referred to the payment of money due to the London branch of the Continental Tyre & Rubber Co., Limited, the judge holding that money owing to the firm by British buyers of tires must be paid and not withheld under any plea of trading with the enemy. Leave was given to appeal, so this decision may possibly be upset; but if not it will not be acted upon in many other cases as, although quite a number of German and Austrian rubber works have agencies and branches in England, they have not the status of British limited companies.

The stoppage of payment from the enemy countries, and also from Belgium, has been a matter of concern to rubber works doing principally a continental business, though the cases are very few in which it has led to serious embarrassment. One such is that of the Lancashire Rubber Works, Limited, rubber heel manufacturers, of Manchester, whose creditors have been called together to discuss a deficiency of £2000. The rubber heel people generally have not had at all a good time, especially as they have not shared in the prosperity arising from government contracts. Talking of contracts leads one on to say that the usual grumbles as to government contracts yielding little or no profit are heard almost to the same extent in these days of apparent prosperity as is the case in normal times. Owing to close competition prices have to be cut somewhat close, and in the interval between tendering and the placing of contracts by

the authorities markets for this or that material may go against the contractor, who does not always care to cover himself in advance for orders which may not materialize. In the rush to obtain goods, accentuated by the appearance of France and other countries in the market, the ordinary procedure of obtaining tenders and awarding contracts has been somewhat varied, and all sorts of people who have got the required goods to sell at competitive prices have attained the position of government contractors. As the greatest care and discrimination is exercised by the government officials, there is no reason to suppose that the country's interests have suffered, despite the rumors which have been ventilated in parliament.

RUBBER CHEMICALS AND THE WAR.

Manufacturers of rubber chemicals report considerable activity in the demand from the home trade, but the most striking feature in the business has been the demand from Japan and various neutral countries which have hitherto presumably bought from Germany and France. Barytes has been specially in demand, though not entirely in connection with the rubber trade. With regard to sulphate and carbonate of barytes I may mention that the world's production is, roughly, 170,000 tons, to which America contributes about 50,000, the United Kingdom 45,000, Germany 25,000, Belgium 31,000 and France 14,000 tons. It will be seen, therefore, that the two leading producers are in a position eventually, if not immediately, to make up any deficit, especially as there is plenty of material, the output of which has been closely regulated by the demand and, I may add, the somewhat unsatisfactory prices, which make the mining a rather unremunerative business.

Golden sulphide of antimony is of course a manufactured article made by comparatively few firms. As the German export is stopped to a large extent, and the French makers are seriously crippled, it is not surprising that the few English makers have found their productive capacity seriously taxed to fill orders for home and abroad. The sulphur situation has been relieved by shipments both from Sicily and America, though the immediate future of the Sicilian imports seems somewhat clouded owing to the recent stoppage of exports to Germany via Switzerland. I understand that an undertaking has to be given that the sulphur is not to be used for munitions of war. I have not seen any of the American sulphur, but am told that it is decidedly inferior to the Sicilian from the rubber man's point of view, and that the advantage in price is very small.

GOLOSHES.

Severe weather, with falls of snow, has been experienced unusually early this winter both in England and on the continent. Naturally this has given a fillip to the golosh trade, the main feature of which, as far as Britain is concerned, is the steady encroachment of the home made article on what a few years ago were the preserves of the Americans. "Bostons," as the latter are termed by the dealers, are still the only sort to be obtained at some shops; elsewhere they stock both British and American makes, while in yet other establishments British goloshes only are obtainable, and if you talk about American sorts you are looked upon as somewhat out of date. The ordinary retail price for men's goloshes is 3/11 [95 cents] and 5/6 [\$1.35], according to quality, the prices varying a few pence according to the status of the retailer's establishment. The average man does not inquire as to the make of the goloshes he is purchasing, or turn up the sole to see whether the stamp is Boston Rubber Shoe Co. or any other American make, North British or "Liver."

The largest makers in Great Britain are the North British Rubber Co. and the New Liverpool Rubber Co., Limited, which makes the "Liver" golosh. The storm slipper is more commonly bought by ladies than by men, while the reverse is the case with the snow boot, which is more commonly worn than it used to be. With regard to nomenclature, while the descriptive term rubbers is hardly ever met with, there is a tendency among retailers to use the likewise descriptive term overshoe instead of the older established one golosh.

STORAGE OF SOLVENTS.

The ordinary position in British rubber works is for the local authority to grant a license for the storage of a certain quantity, which must not be exceeded. Since the war, however, surveillance has been kept by the military authorities, under the powers of the Defense of the Realm act. Under these circumstances action was recently taken against the Pluviusin Co., Limited, of Mouton, near Manchester, for storing solvent in excess of their license, and a fine of £2.20 [\$10.22] and costs was imposed, despite the plea that the company had been busy in government work, and had experienced a difficulty in getting supplies.

The Crude Rubber Washing Co., one of the various flotations of the rubber boom, appears to be slowly making its way towards prosperity in its new home at Wembley. A proposal is shortly to be brought forward to change the name of the concern to the Alperston Rubber Co., Limited. This seems a sensible move now that the business is largely concerned with the manufacture of rubber goods, and the name would be less likely to invoke painful memories in the minds of those who omitted to sell out at the high water mark.

Portugal, which has now entered into the war as one of the Allies, has no pretension to rank as a rubber manufacturing country, as it has only one rubber works, established near Lisbon somewhere about fifteen years ago.

Lieutenant-Colonel Fallows, of the Leyland & Birmingham Rubber Co., Limited, who holds a command in the East Lancashire Territorial Brigade, is now with the brigade in Egypt, where the horizon at the moment is much more clouded than was the case a month or two ago.

Mr. R. G. Stewart, I regret to report, died last November. The greater part of his life was spent in the service of the North British Rubber Co., at Edinburgh and London, and in 1900 he succeeded the late Mr. Bartlett—of detachable pneumatic tire fame—as general superintendent of the Castle Mills. It is now a good many years since I met the deceased, whose kindly disposition endeared him to a wide circle of friends.

The death has also been recorded of Mr. John Sykes, for many years chairman of the Card Clothing Manufacturers' Association. Though his Lindley Mills at Huddersfield were devoted to the production of rubber faced cards for textile mills, he was also a cotton spinner on a large scale, and a man of considerable wealth.

Rubber pavement is on trial in the city of London on a section of the Old Kent Road, where traffic is heavy, the average being ninety tons per square foot per hour for twenty-four hours. Another section is to be laid down in Cannon street, in the very heart of the city. The Rubber Growers' Association gave 1,000 tons of plantation rubber for the experiment, and has offered an additional 1,000 tons at the nominal price of 25 cents a pound.

The pavement is made by laying jarrah wood blocks with a surface cushion of rubber held by dovetailing. The blocks are easily removable; they interlock perfectly and with water-tight joints. The vibration is so much less than with any other form of pavement that a much less substantial foundation is needed.

The section in the Old Kent Road after 295 days of use shows no signs of wear, whereas an adjacent four-inch wood block pavement lost one-half an inch in thickness in the same time under the same load.

E. BUNGE & CO.

The London "Times" chronicles the sudden descent of German

EDWARD BUNGE.

officers upon the office of E. Bunge & Co., Antwerp, the claim being that Belgian treasury funds had been deposited in their keeping. Mr. Edward Bunge will be remembered as the president of the Rubber Planters' Association of Belgium and as one who has been exceedingly active financially in the development of both wild and plantation rubber. Many of the plantation companies in the Federated Malay States were financed by the Bunge Association.

CLAIM TO BE ENGLISH.

R. Woolfe & Co., Limited, rubber manufacturers and waste merchants, of London, England, announce that they are a distinctly British firm, having no business or national connection with Austrians or Germans. Their entire staff is English and their ancestors began business in England more than 200 years ago.

RUBBER TIRES FOR STREET CARS.

The introduction of tires made of rubber or other silent material for street cars, was suggested by a speaker at a recent meeting of the Tramways' Association of Great Britain. He contended that a properly designed tire for street cars would exceed in durability tires now in use on motor buses and motor wagons, on which a life of 20,000 miles was common. Moreover, the wear and tear on the rails, and the cost of maintenance, would be greatly reduced.

The fact that rubber tires would eliminate noise and vibration, while a speed of 20 miles an hour could be attained, was advanced as an argument in their favor.

The Rubber Planters' Association, of London, not long ago diverted many tons of plantation rubber to street pavements, hospital floors, etc. This was to produce new uses and thus avoid a glut in the market and consequent low prices. It was enterprising but of doubtful expediency. That same rubber on the market today would be a boon to some one.

According to reports coming via Germany, there is a shortage of raw rubber in Norway, Sweden and Denmark. It appears that large quantities destined for nordish manufacturers have been detained by England. It is said that one large rubber works in Norway already has been compelled to close its doors.

NORWAY.

Motor delivery wagons are gaining in popularity in Norway and it is expected will ultimately replace horse-drawn vehicles in that country, particularly in the lighter models. A report from United States Consul General Hendrick, of Christiania, states that in that city there are 150 motor delivery vehicles, including 14 motor trucks.

RUBBER GOODS IN SPAIN.

According to the report of the Austrian Consul at Barcelona, the Spanish market affords a good outlet for rubber products, rubber shoe imports having in 1911 represented \$85,000, while toys and stationers' sundries amounted to \$80,000. The principal part of the goods mentioned have come from Germany and Austria-Hungary.

SWISS TRADE IN RUBBER HEELS.

When first introduced in Switzerland some years ago, the demand for rubber heels was small. Few dealers carried them, but those that did realized fair prices. This trade has now been taken up by all leather and rubber goods dealers, so that competition has eliminated much of the profit. The most popular style and quality is selling at 8d. (16 cents) retail.

THE FRENCH IMPORT DUTY.

A letter received from the Rubber Growers' Association, London, in regard to the French import duty on indirect rubber shipments, states that direct shipments of rubber to France are now permissible, provided the bills of lading are made out to a distinct consignee in France—the exemption applying to products of extra-European origin originally destined for France or Algeria and disembarked at British ports in consequence of the war, but not to such products in general regardless of their original destination.

MADAGASCAR SUBSTITUTING MOTOR CARS FOR RAILROADS.

The French authorities in Madagascar are said to have decided to give up the operation of the local railways, on account of the comparatively small number of persons using them, and to transport passengers exclusively by automobile. For some years the railways have been run at a great loss by the government, but since the trial operation of automobiles the cost per passenger mile has been greatly reduced. It is hoped to make the enterprise self supporting by the end of the year 1914.

GERMAN NOTES.

GERMAN and Austrian rubber manufacturers have been unable to procure their usual supply of "M. R. X." since the breaking out of hostilities. Proposals, however, have recently been made by an agent in one of the neutral countries bordering on Germany for a large supply of "M. R. X." for which there can be only one ultimate destination. The matter is yet under negotiation.

Berlin has had an interesting exhibition under the name "What the German Soldier Needs in the Field." The purpose of the enterprise has been to show to the public in general and to encourage the sale of articles which might be of use to the soldiers in the field. The German rubber industry was well represented and a great variety of rubber goods was sold at the exhibition, including waterproof coats and caps, rubber bottles, waterproof sheets, rubber socks, gutta percha sheet, etc. There has been a large demand for rubber boots, mainly those with high tops, and for pneumatic cushions.

The board of the United Harburg & Vienna Factories, at its last meeting, decided to propose to the general meeting contemplated for November a dividend of 6 per cent. The net profit amounts to \$190,894, against \$145,179 for the previous year. To this there should be added the profits carried over of \$85,231. After writing off large sums for depreciation and reserves, the carrying forward of a further increased amount is contemplated. Since the outbreak of the war the departments working for army requirements have been well occupied. On the other hand, the difficulties of export trade have caused a reduced outturn in the departments.

Manufacturers of rubber coats and rubber clothing have sent

out a circular informing their customers of a large advance in the prices of rubber coats, vests, etc. The advance has been made necessary by the high price of raw material in Germany and by the demand for rubber for the manufacture of tires and other war material.

The war has had a beneficial influence on the turnover of those retail shops specializing in rubber goods. While in ordinary times a good deal of trade has been taken away from these establishments by outfitters, shoe stores, etc., interest concentrates now in specialties, and the dealers find that they can sell not only bandages and surgical rubber goods, but also such articles as rubber coats, rubber shoes, etc.

According to advices coming from Vienna, the price of raw rubber has increased to about four times the value before the war. This, of course, has caused a considerable advance in practically all classes of rubber goods.

The report that the Dunlop Rubber Co. of Germany contributed \$5,250 to a British war relief fund is denied by the company. On the contrary, they contributed to the various Red Cross stations in Germany \$1,250 in cash. They also gave \$1,250 worth of rubber goods for hospitals, 10,000 "helmet sponges" and an infirmary with 80 beds. They are paying their men who are in the army 50 per cent. of their wages and they have also donated two automobiles to the German Red Cross.

The Continental Caoutchouc & Gutta Percha Co. has turned one of its huge buildings into a thoroughly equipped hospital. The chief executive is Dr. Gerlach, who is well known to many manufacturers in the United States. The Continental company states that in consequence of the advance in cost of raw material, which amounts since the beginning of the war to from 60 to 75 per cent., it has been obliged to advance the price of its pneumatic tires. The new price list (No. 124) dates from August 24.

Herr Heinrich Pfeiffer, for many years business manager of the Eduard Frankenburg Rubber Factory, Hanover, has undertaken since October 1 the direction of the rubberized fabric department at the Hanover-Linden Rubber Manufacturing Co.

The Cable Works at Fröndenberg, Ruhr, have been registered for the manufacture of all descriptions of insulated wire, with a capital equaling \$16,500. Herr August Köhle is business manager.

The directors of Maschinenbauanstalt Humboldt, makers of rubber machinery, Köln-Kalk, propose a dividend of 6 per cent. The trading profit was 6,144,049 marks [\$1,462,284]. A special contribution to the reserve fund of 200,000 marks [\$47,600] is proposed, and the same amount is set aside for the benefit of persons depending upon officials and workmen who have been called upon for active service. 1,385,083 marks [\$329,650] are carried to new account. The dividend declared for the year 1912-13 was 8 per cent., from a trading profit of 5,793,573 marks [\$1,377,870].

Austria-Hungary has prohibited the export of insulated wire to Belgium, France, Great Britain, Japan, Russia and Servia.

The German auxiliary cruiser *Cap Trafalgar*, which was sunk on September 14, had about 14,000 square yards of rubber flooring, which had been laid by the Gummiwerke, Fulda. This material had proved efficacious in service and had been adopted by many other steamers.

Rubber news from Germany is difficult to get and often delayed. What crude rubber there is is held at a premium of about one hundred per cent. Its use for individuals, as for motor tires, has been prohibited. Factories such as the Continental, Dunlop, Harburg-Wein and Metzler, are running, but on government orders only. The great Zeppelins, for example, take much rubber. A visitor reports seeing cloth for fifty of these craft being coated in one of their factories.

Every particle of rubber scrap in the country is being collected and turned into reclaimed rubber. It is said (not verified) that

new mats, hose, toys, and goods not absolutely necessary have also been scrapped and reclaimed. The same source also affirms that stores of hard rubber goods ready for export were condemned and ground to dust and remanufactured into electrical parts, for military use.

In this connection the late German prohibition of the export of hard rubber goods in any form takes on an added interest.

The following are included in the list of articles forbidden export by Germany: Caoutchouc, guttapercha, balata; waste rubber; oil caoutchouc for proofing; surgical instruments, with exception of obstetrical and dental; rubber for rubber hose, bandages, etc.; cable for military and general purposes; goods out of soft caoutchouc, with the exception of guttapercha paper and certain products of guttapercha for asbestos goods. Special permits must be obtained if it is desired to export any of these articles, and no permits will be granted on hose, tubes, tire covers and tires.

Among rubber goods to which attention has been given in Germany for the war are drinking bottles, tobacco boxes and other articles to help the German soldiers withstand the hardships of war. Recent additions to the military kit include "gutta percha paper" for the treatment of sore feet. This article is displayed in the druggists' windows, accompanied by a show card calling attention to its merits, and stating that its application does not involve disuse of the feet. It is wrapped around the feet before putting on the socks, so that the sore places are fully covered, thus relieving the friction caused by the socks in marching.

In addition to the regular articles needed by soldiers, there are a number of specialties which have been taken up in Germany, such as sleeping bags, ear protectors, and head, ear and nose bandages. Caps, including the "Mensur" style, which have been in the hands of bandage makers and druggists, are also now receiving the attention of the rubber trade.

The "Vogufa" Rubber Goods Factory, of Pausa, Vogtland, Saxony, has patented a substitute for rubber shoes in the form of a protector made of strong rubberized fabric, to be worn in the shoe over the stocking. Small openings on the upper part prevent the stoppage of perspiration. Even when the shoes are broken it protects the foot from moisture and cold.

A GERMAN VIEW OF SHOE MANUFACTURE.

A GERMAN manufacturer writes as follows in the columns of the "Gummi-Zeitung" on the subject of vulcanizing rubber shoes:

Of all factory made rubber articles, rubber shoes claim the greatest attention. Not only is the utmost care required in the selection of the raw materials and in the compounds, but it is particularly the vulcanization which can lead either to the production of a first class article or of the reverse.

In spite of the use of tried compounds and suitable grades of crude and reclaimed rubber, the following defects may be produced in the finished shoes by defective vulcanization: 1, Porosity of the soles; 2, blistering of the uppers; 3, sub-vulcanization and the consequent exudation of sulphur; 4, super-vulcanization or so-called "scorching"; 5, metallic appearance of the varnish.

Porosity almost exclusively arises from moisture in the raw materials. Therefore, crude and reclaimed rubber must be first dried by heat. Whiting (or like substances) can be dried in a special stove, being then carefully protected against moisture during storage. Tars, pitches or oils are first superheated in order to remove all volatile components. It is considered advisable before use to obtain laboratory tests of the separate materials for moisture. That even with such precautions porous soles may be turned out, may arise from using crude rubber with too high a resin content or which is decomposed.

The blistering of the uppers is usually due to the presence of

moisture in the fabrics used. It is consequently recommended to first boil these fabrics thoroughly in vats, and to dry them carefully.

Under-vulcanization and the consequent exudation of sulphur, provided the compound has been rightly prepared, arises merely from a mistake in curing. Shoes with this defect are not bad merchandise, though the flaw renders them unsalable to the fine trade. Super-vulcanization or "scorching" causes the shoes to be unmerchantable, and may be caused by a defect in the plant, or by carelessness of the operator. Super-vulcanized shoes tear at the edges, break in the uppers and crack in the varnish.

Metallic brilliancy in the varnish of the upper is caused by the heating pipe not being tight, by which means moisture is allowed to penetrate during the vulcanization; or by the atmospheric air being too damp at the time of admission. The vulcanizing chamber ought, therefore, to be heated before use.

The following method of vulcanizing shoes, the result of many years' experiments, has been found to produce articles of good and regular quality. A horizontal vulcanizer is used, of about 8 feet in diameter and 32 feet in length; the heating coils, each acting separately, being built in as usual. At the back end of the vulcanizer in the lid, as well as in the side walls, are spaces for the recording thermometers.

In the interior of the vulcanizer at the highest and lowest points pipes are inserted, reaching from the back wall. These are provided with small openings (1/25 to 1/6 inch) toward the inside of it. Between these two pipes are placed at a higher level two other pipes; the suction and pressure pipes of the rotary mechanism driven by a small motor. The hot air is thus continually drawn from above and forced back into the oven, where it is distributed through the perforated pipe. Uniformity in the suction or pressure of the air must be tested before the apparatus is placed in operation. Sheets of metal are hung between the pipes and the shoes in order to prevent too direct a radiation of heat and to distribute the pressure of the air. The fans of the rotary mechanism should revolve at the rate of 260 to 300 revolutions per minute, and the drive must be sufficiently forcible to absorb and introduce the air with rapidity at a pressure of 22 to 29 pounds per square inch.

At the beginning of the vulcanization the air first introduced, which is charged with the fumes of varnishes, etc., is allowed to escape into the open; fresh air previously heated and dried being admitted. During the process of vulcanization the rotary mechanism is allowed to revolve several times in a reverse direction to ensure the absorption of the air and its re-introduction from above. By hanging maximum thermometers at various points of the vulcanizer the highest temperature arrived at can be recorded for future reference.

This system of vulcanization is said to give a thoroughly uniform product, and to prevent claims in regard to defects in manufacture, which were formerly unavoidable.

PLANTATION FIRES.

A fertile source of danger on plantations arises from the neglect of planters to extirpate the "lalang," which is found between their trees. The government of Cochin China has addressed a circular to the colonial administrators of the country, comprising the above view and adding that there is absolutely no risk of fire on the plantations visited, where they are carefully kept. This danger, however, exists where the planter fails to destroy the grasses and merely lets them dry where they lie. In such a case the least spark will produce a conflagration.

In conclusion it is impressed on the colonial agents that it is advisable to call the attention of planters to this source of possible danger.

A book for rubber planters—Mr. Pearson's "What I Saw in the Tropics."

THE JINRIKISHA AND ITS TIRES IN CHINA.

From Our Japanese Correspondent.

THREE kinds of jinrikishas are used in Manchuria—iron, rubber and pneumatic tired, at prices from \$30 to \$50. The pneumatic tire is intended for use with the Chinese type of jinrikisha, which is rather smaller than the other two. An estimate places the total number in various parts of Manchuria at—Chanchin, 650; Futien, 3,000; Reijon, 127.

Rubber tires are imported into Manchuria either through Chinese merchants in Futien, who gather them from other districts, or through Japanese dealers at Chanchin, who buy from the manufacturers in Japan. About 70 per cent. of the total are solid rubber tires and 10 per cent. rubber pneumatic tires. The solid rubber tires used on these jinrikishas cost \$8.50, and the pneumatics \$12.50. At Futien rubber tired jinrikishas are selling at from \$36 to \$45 in the cheaper grades, up to \$56.25. Solid tires are imported from Tokio and Osaka.

The carriages, wheels, tires and other parts of jinrikishas are imported principally from Osaka, and assembled by the Japanese merchants at Futien, who sell the vehicles to Chinese dealers in completed form. The latter distribute them to private consumers on the instalment plan.

Dealing with other parts of China, there are in Chefoo 450 jinrikishas, those using solid rubber tires costing from \$18 to \$23 for common to \$36 for superior grades. Wheels in conjunction with solid rubber tires cost \$9 a pair. Foreigners have shown a preference for jinrikishas with solid rubber tires, but the Chinese have continued to use the cheaper iron-tired vehicle. It is anticipated, however, that improved roads will develop the use of rubber tires.

Shanghai has two kinds of jinrikishas, the Foboche with a rubber pneumatic tire—of which there are about 10,000—and the Yajiche, numbering some 2,000, with iron tires. In addition there are about 2,500 Foboche for private use. The 12,500 Foboche used in Shanghai are fitted to the extent of 80 per cent. with pneumatic rubber tires, of which 30 per cent. come from the Dunlop Rubber Co. (Far East), Limited, of Kobe, whose manufactures are guaranteed for 6 months.

In addition to the Dunlop company, the Michelin company does an excellent business in tires, the Foboche having been originally a French article, and most of the persons hiring out jinrikishas being Frenchmen. The French goods, while not guaranteed and slightly dearer, are said to be rather better than the Dunlop make. Besides the Dunlop and Michelin companies, the Continental Rubber Co., a German concern, supplies 20 per cent. of the demand under a six months' guarantee.

The jinrikishas in Shanghai require about two pairs of tires each in a year, or for the 12,500 Foboche in use, 25,000 pairs annually, with a value of \$200,000 on the basis of \$8 a pair.

In Hong Kong there are 2,200 jinrikishas, the majority of which have solid rubber tires, imported from the Dunlop Rubber Co., London, and other British and German firms.

Pneumatic rubber tires are not used in Hong Kong, the unevenness of the roads being responsible for the demand for a strong, solid tire. The Hong Kong jinrikisha makers import the parts from Great Britain, Germany and Japan, and ship their products to other parts of China. The largest maker in Hong Kong is Koche Konau, with a capital of \$25,000 and 800 vehicles for hire.

TAPPING ON ALTERNATE DAYS.

With a view to prevent over-production, the Malacca Planters' Association recently agreed to the plan of tapping on alternate days. A meeting of the body named favored a general reduction of production by 30 per cent.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

DECOMPOSITION OF RUBBER THROUGH MICROBES.

IN dealing with the above subject, N. L. Söhngen and J. G. Fol lately considered the following questions:

Are the mechanical properties of the portions colored by the action of microbes different from those of the uncolored rubber? Is there consequently any reason for a lower valuation of colored rubber? Is the hydro-carbon in rubber subject to the attacks of microbes?

In the second part of the article the authors speak of the micro-organisms in rubber and their influence upon its mechanical qualities. They first give a review of the subject and record their experiments regarding micro-organisms and the mechanical properties of spotted rubber. They deduce the opinion that the microbes forming the spots beyond the discoloration exercise no injurious effects on the rubber. Thus a lower valuation of spotted rubber cannot be defended. According to their opinion it is, however, advisable to prevent the growth of the micro-organisms, which can be accomplished by a suitable arrangement of the drying chambers. It is only at a certain degree of moisture that microbes are developed in rubber.

The third part of their article treats in detail of the microbes which attack rubber, the following results being obtained by the authors:

1. On air-dried rubber (containing 0.5 per cent. of water) micro-organisms cannot be developed in consequence of the lack of water.

2. When water is present in abundance, commercial rubber is a medium for the development of many kinds of bacteria and germs, to the detriment of the albumens, sugars and resins which are present. Some kinds produce red, black or brown spots without noticeably changing the mechanical properties of the rubber.

3. Two kinds of *actinomyces* often found in garden soil and sewer water, *actinomyces elastica* and *actinomyces fuscus*, are in a position to attack and assimilate the hydro-carbon in rubber.

4. From these microbes an enzyme attacking rubber and soluble in water is not obtained by separation.

5. The knowledge of the facts—first that the development of microbes can take place in moist rubber, when the rubber hydro-carbon is not decomposed, and the mechanical properties do not change, but where pigments are often given off, which diminish the market value of the rubber; and secondly—that there are kinds of *actinomyces* which can positively attack the hydro-carbon of rubber, and thus lower the viscosity, makes it desirable to again urge that it is of the greatest practical interest to prevent as far as possible the development of micro-organisms in rubber. The growth of microbes is prevented by the rubber being dried on the plantation as quickly and carefully as possible, in suitably arranged drying chambers.

[G. S. Whitby (see V. 25, P. 596 to 621 of 8th International Congress of Chemistry, New York, 1912) concluded that tackiness in rubber was caused by an enzyme, but V. Rossem (Caoutchouc et Gutta Percha, February '13, P. 6981, and Chem. Abs., '13, P. 1811) attacks these views.]

LATEX DENSITY EXPERIMENT.

A number of experiments were made during the last year to test the specific gravity of latex, from which a suitable latex hydrometer has been constructed. This machine is made by J. J. Griffin & Sons, London, and is intended for factory controls. Experiments were carried out to test the comparative value of formic and acetic acids for *Hevea* coagulation. It has been suggested that if the rubber prepared with formic acid proves equal to that produced with acetic acid the former should be substituted for the latter, being cheaper and more economical. It would be still cheaper but for the high freight charged on it by the steamship companies as being dangerous cargo.

Some Rubber Planting Notes.

THE USE OF WATER IN TAPPING.

DR. A. J. ULTEE, director of the Besoekisch Testing Station at Djember, Java, having stated that the use of water in tapping tends to reduce the volume of production, Dr. F. T. Beederode disputes this theory in a recent number of the "Indische Mercur." He believes that with the use of water, latex flows longer than otherwise and thus increases the volume of production. He does not unconditionally reject dry tapping, but believes the use of water to be a distinct advantage. This, he contends, is particularly so where there are laborers enough so that no laborer has to care for more than 250 trees. Where the supply of labor is insufficient and each tapper is required to look after 500 to 600 trees, dry tapping, being more quickly done, he admits is preferable.

RUBBER IN SUMATRA.

According to the Imperial Institute of London there is a considerable difference in the rainfall at various points in Sumatra, but it is everywhere sufficient. Owing to the good soil rubber trees can grow at altitudes up to 1,000 feet, but are usually situated between 4 feet and 120 feet. The Assam rubber tree, *Ficus elastica*, is grown in the provinces of Benkulen, Tapanuli and Achin.

The acreage under *Hevea* increased from 400 acres in 1902 to 197,530 acres by the end of 1912, in addition to which there were plantations of *Ficus elastica*. The nominal capital in Sumatra rubber plantations at the end of 1912 was estimated at \$53,000,000, of which one-half was British. Many coffee plantations have been transformed into plantations of *Hevea*.

A NEW RUBBER COAGULANT IN CEYLON.

Toddy Vinegar, the new coagulant, has already been mentioned in these columns.

The process of manufacture consists of the waste coconut water being allowed to ferment for four or five days, when it can be immediately used for coagulation. One or two ounces of fermented liquid will coagulate a pint of pure latex, producing a finer rubber than is obtained by the present system of using crude acetic acid. Experiments are now being made as to how long the liquid will keep, and as to whether it will stand transportation to the rubber estates.

RUBBER KEEPS BETTER THAN TEA.

With reference to the storage of rubber the "Times of Ceylon" states that at the opening of the war a good deal of rubber, tea and other products was stored in local warehouses, in view of the disturbance of business. Rubber will not deteriorate from storage, while tea after a couple of months in stock becomes a more or less unmarketable product.

CEYLON CONDITIONS—1913-1914.

Heavy investments were made some years ago by Ceylon planters, and the commercial community generally, in young rubber trees, and large returns were required from the revenue bearing estates to develop the immature plantations. The drop in rubber prices in 1913 on the London market caused real distress, and for a time threatened ruin to a number of rubber companies, and even to various commercial houses. The crisis was, however, safely passed and the market recovered somewhat toward the beginning of 1914. Among the principal difficulties planters had to contend with were the heavy rains which impeded cultivation, and the increased difficulty in getting sufficient labor from South India.

RAILWAY EXTENSION IN THE FEDERATED MALAY STATES.

The new railway line from Bukit Mertajam, a junction near the town of Penang, to Alor Star, the capital of Kedah, has been opened for traffic. It forms part of the Federated Malay States government railway system; which is thus brought closer to the Siamese frontier. The ultimate connection of the new line with the Royal Siamese Railway is in contemplation. It is anticipated that the opening up and development of Kedah will be facilitated by the improved communication thus established.

WHAT MALAYA MIGHT HAVE DONE.

In taking the chair at the inaugural lecture of the City of London College rubber course recently, Mr. John McLuan, chairman of the Rubber Growers' Association, said that there were areas of *Hevea* 10 or 11 years old, producing 750 pounds per acre. If all the planting had been uniformly successful, the 700,000 acres in Malaya would in a few years give about 234,375 tons, leaving the rest of the world out of the calculation.

In conclusion he remarked that at no very distant date such an article as rubber is bound to be produced on a scale unprofitable to a large proportion of the companies engaged in the industry. He hoped, however, that lowness of price will lead to many new applications at present not dreamt of.

EXPERIMENTS IN THE MALAY TESTING STATION.

In a communication from the Federated Malay States Information Agency, Mr. Lewton-Brain, who is in charge, describes the vulcanizing and testing station established at Kuala Lumpur, which is said to be one of the most complete in existence. He states that many experiments have been tried with a view to solving the problem of plantation rubber.

What the manufacturers complain of is not that plantation rubber is not good, but that it is not uniform; that each lot must be treated differently. In solving this problem many experiments and tests have been made on working, vulcanization, etc.

The problem of variability in plantation rubber is an extremely complicated one, and it will be years before the full value of this work can be realized. Work has at least been started on the fundamental problem. Generally speaking the large plantations are taking more care to keep methods and products uniform. Still many extractors use haphazard methods. Experiments were carried out on smoking, drying, dilution of latex, coagulation, fungus spots, tackiness, etc.

RUBBER ACREAGES IN BRITISH MALAYA.

Official statistics of the planted surface in British Malaya are as follows:

	January 1, 1913.	January 1, 1914.
Federated Malay States.....acres.	399,197	433,324
Straits Settlements	94,263	111,316
Johore	91,827	117,022
Kelantan and Kedah.....	34,837	45,373
Trengganu	1,497	1,510
Total	621,621	708,545

MORE LIGHT IN PLANTATIONS.

Large rubber plantations in Malaya have experienced trouble in the renewal of the bark, due to the trees being too close together. The time is foreseen when such plantations will be obliged to cease tapping the older trees, the bark renewed being too thin to allow of tapping with profit. Planters remove the useless branches and then cut down the trees which prevent the development of their neighbors. This movement of giving more light is said to be getting more general.

ENGLISH VIEWS OF PROSPECTIVE RUBBER PRODUCTION.

Mr. A. Lampard, the well-known authority on rubber, has expressed the opinion that the plantation production of 1914 will amount to 70,000 tons, and that from the present acreage under plantation rubber there will be a gradual increase up to 180,000 tons.

The wisdom of England having an independent supply of rubber has been amply demonstrated by the present war. Owing to the good quality of plantation rubber and the economy of its production, he believes that the practical elimination of wild rubber will soon become an accomplished fact.

Dealing with the probable future of plantation rubber, Mr. John McEwan, chairman of the Rubber Growers' Association, thinks that the threatened check to production is likely to be only temporary. He declares that he is pessimistic as to the future of rubber, but only so far as it relates to large yields and low prices. He looks for low prices as the inevitable result of the coming large production, but the existence of these factors holds out promise of large development of trade. He adds that with plans thoroughly organized, producers have little to fear from low prices, as the high yields per acre at low costs per pound will give excellent returns on reasonable capitalizations.

WAR CONDITIONS IN STRAITS SETTLEMENTS.

In an official report Consul General Caspar L. Dreier, at Singapore, has summarized the measures taken by the Straits government to meet the conditions arising from the war. Arrangements were made for making advances on rubber to planters, in order to facilitate the working of the estates without a material reduction of labor.

War risk on general cargo shipments was taken by the government at 5 per cent., but in view of the insurance companies reducing the rate to 2 or 3 per cent. the official rate was only made use of to a slight extent.

The banks, which at first had been stringent in their action, soon relaxed this policy, with the result that produce began to move again. No local moratorium had been declared.

Statistics of the total exports for 1913 from the Straits Settlements and the Federated Malay States show: Gutta percha, \$2,968,186; Para rubber, \$46,847,474. The proportions sent to the United States were \$66,991 and \$4,366,443. The exports from the Federated Malay States alone for 1913 are given as, respectively, \$26,114 and \$32,524,024.

Commenting upon local conditions, the report shows total imports of about \$135,000,000, including cotton blankets and piece goods to the extent of about \$18,000,000. The importance of this market both as a source of supplies and an outlet for manufactures is thus illustrated.

THE FUTURE OF RUBBER PRODUCTION IN FRENCH OCCIDENTAL AFRICA.

The rubber crisis in Brazil has opened the eyes of French colonial officials to certain dangers which may result to French Occidental Africa by an undue preponderance of rubber production in the economic resources of the colony. Official inquiries which have been extended to the British rubber plantations in the East, and French plantations in Indo China, have given the impression that those plantations, in consequence of their better working methods and cheaper and more efficient labor, will be able to undersell the African product. This would threaten the destruction of the rubber production of those regions and endanger the economic life of the whole colony. It seems, therefore, necessary that rubber production in French Occidental Africa be raised to the same level as in the Federated Malay States and Indo China. As this, however, would be very difficult, it seems likely that rubber production in the colony may be discouraged in future, in favor of more promising products.

WEST AFRICAN RUBBERS.

The latest bulletin of the Imperial Institute, London, contains a group of interesting reports on various rubber samples of West African origin. These include Para rubber from the Gold Coast and Sierra Leone, and Funtumia rubber from the former source.

PARA RUBBER FROM GOLD COAST.

On the Gold Coast the government agricultural stations (notably those of Aburi and Tarquah) have very successfully undertaken the cultivation of *Hevea Brasiliensis*, besides which European cultivators have established a number of plantations, some of which have now reached the productive stage. In many parts of the country the natives are devoting attention to the tree, and tapping at the above named stations has been successful.

In tapping blocks of trees at Aburi average yields were obtained for 158 tapplings of 2 pounds 10½ ounces, and for 156 tapplings of 2 pounds 13 ounces. At Tarquah experimental trees eight years old gave an average yield of 3 pounds 12 ounces of dry rubber when tapped on alternate days.

A sample of smoked Para biscuit from trees thirteen years old at Aburi, received in January, 1914, and valued in July of the same year at 2s. 1d. (50.68 cents) per pound, gave the following results: Loss in washing (moisture and impurities), 0.8 per cent.

Composition of dry washed rubber:

Caoutchouc	per cent. 94.1
Resin	2.9
Protein	2.7
Ash	0.3

PARA RUBBER FROM SIERRA LEONE.

Two samples of Para rubber produced experimentally in Sierra Leone—one of them from trees five to six years old—coagulated with lime juice and dried in smoke, showed 94 per cent. of dry, washed rubber. In composition it compared favorably with eastern plantation Para, being, however, somewhat deficient in elasticity and tenacity. This feature is attributed to the method of coagulation, and the use of acetic acid is suggested.

The second sample, from trees four to five years old, coagulated by evaporation, air-dried and smoked, yielded 92.6 per cent. of caoutchouc, and showed in physical properties superiority to No. 1. With this grade it is likewise recommended to use acetic acid in place of coagulating by evaporation, which increases the amounts of resin and protein in the rubber.

FUNTUMIA RUBBER FROM THE GOLD COAST.

In January, 1914, a sample of *Funtumia* was received at the Imperial Institute from the Gold Coast, prepared by the addition of 1 per cent. of formalin to the crude latex and by drying in a smoking chamber. The rubber was clean, and its physical properties good. Analysis showed 81.7 per cent. of caoutchouc, 10.1 per cent. of resin and 7.5 per cent. of protein. In July, 1914, this quality was valued in London at from 1s. 10d. (44.60 cents) to 1s. 11d. (46.62 cents) per pound.

RUBBER IN PAPUA

According to a recent statement of Mr. A. S. Blomfield, of Melbourne, who lately visited Papua to look after his rubber interests, the total area controlled by his various companies is about 30,000 acres, of which 1,500 acres are under rubber. The first rubber trees were planted six years ago, the stumps coming from Ceylon, from which source, as well as from Singapore, seeds were subsequently obtained. Planting was on a scale of 22 x 16½ feet, or 112 trees to the acre. While the rainfall was fairly light (about 65 inches), the growth of the trees was good. Tapping commenced at the age of 3½ years, when the circumference exceeded 18 inches at 3 feet from the ground.

In 1913 7,000 trees were tapped, which produced 10,000 pounds of rubber, the best of which realized 2s. 3½d. (55.75 cents) in London.

RUBBER IMPORTS AND EXPORTS AT SANTOS.

The Santos district of Brazil imported in 1913 rubber goods to the value of \$405,000 from the following countries: Great Britain, \$78,000; Italy, \$40,000; Germany, tires \$35,000, rubber goods (unspecified) \$60,000; France, tires \$192,000.

The rubber exports for the first six months of the present year from that port only amounted to \$3,119, as compared with \$22,612 for the same period a year ago.

THE NEW DUTCH BANK FOR SOUTH AMERICA.

Much interest has been shown in the Dutch Bank for South America, which was established before the outbreak of the war, with a capital equaling \$1,608,000. It contemplates operating chiefly with Argentina, attempting to secure a share of the \$20,000,000 worth of trade now passing between Holland and that country. Aside from the banking institutions in the Dutch Indies, it is said to be the first of that character with Dutch capital, intended to facilitate oversea trading.

PARA COMMERCIAL ASSOCIATION.

On November 9 the Para Commercial Association celebrated the fiftieth anniversary of its foundation, in its new quarters at 33 and 34 Boulevard da Republica. After opening the proceedings, Senhor Manuel José Rebello, Jr., president of the Association, invited Major Pedro Nolasco Monteiro, representing the governor of the state, to take the chair, likewise asking the collaboration of Senhor Dr. Antonio Martin Pinheiro, mayor of Para, and other officials, including Senhor José Amando Mendes, first secretary of the association, who read the original minutes of November 9, 1864. Letters of regret were then heard from Dr. Eneas Martins, governor of the state, and from M. Ed. Payan, French consul at Para.

Dr. Eladio Lima, the official orator of the association, then delivered an eloquent address, giving an historical review of its career, in the course of which he referred to the establishment of the Practical School of Commerce. Another feature of the program was the presentation of prizes to the students of the above school whose terms had concluded in the years 1908 to 1914.

PREPONDERANCE OF HEVEA IN BRAZILIAN SHIPMENTS.

According to the report of Consul Robert Fraser, Jr., of Bahia, the exports of Brazilian rubber for 1912, the last year for which official statistics are available, were: *Hevea*, 38,151 tons; *Mangabeira*, 388 tons; *Maniçoba*, 3,724 tons; total, 42,263 tons. Bahia's proportion was 2,025 tons, comprising *Mangabeira*, 96 tons, and *Maniçoba*, 1,929 tons.

It is estimated that Bahia shipments for 1913 were only 579 tons, practically all *Maniçoba*, sold at about 40 cents per pound. During the last year Bahia rubber has largely gone to France, whereas a large proportion was formerly sold in the United States. *Mangabeira*, on account of its lack of elasticity, is used principally for rubber matting and like purposes.

For the first time in history, a shipment of beans raised in the Acre territory has arrived in Manaus. This means that the Acre rubber gatherers are not only raising their own produce, but are getting into a position to export it.

The Department of State after communicating with Ambassador Morgan at Rio de Janeiro, informs THE INDIA RUBBER WORLD that the Brazilian Government desires and intends to continue during 1915 all the American preferentials.

Mr. D. C. W. Aymors, manager of the General Rubber Co., Para, Brazil, has recently been in New York, enjoying a well-earned vacation, part of which was spent in Europe. He sailed for Para on the "Justin," December 30.

RUBBER IN BOLIVIA.

According to a French report the Bolivian production of rubber in 1912 consisted of—*finca*, 1,355 tons; *caucho*, 689 tons; *sernamby*, 166 tons, forming a total of 2,210 tons, against 1,644 tons in 1911. Four varieties of trees furnished the latex: *Morada*, found in low and marshy soils; *Blanca*, found on the plains; *Amarilla* and *Itambe*.

The average yield is 8 pounds per tree, but virgin trees give a larger quantity. Because of the bad methods used by the natives a long rest is necessary between the tapping periods.

The *estradas* (or lots handled by one tapper) usually contain 100 to 120 trees, often at considerable distances from each other. The tappers receive no fixed salary, but get the equivalent of 40 cents per pound for fine rubber collected, and about 24 cents per pound for *caucho*. These conditions might be acceptable were it not that the tappers are obliged (as in Brazil) to purchase their provisions and supplies from their employers at outrageously high prices. Bound down by this perpetual debt, they are the victims of an iniquitous system which is one cause of the decadence of wild rubber.

The tapping season lasts from May to the middle of August, and from October 1 to January 1. Rubber is usually shipped in bales of 30 to 100 pounds. Fine grades are often shipped in bulk, *sernamby* being sometimes cased and *caucho* being in bales of 100 to 150 pounds. Rubber is occasionally placed in skins, which are sold on arrival at destination.

PERUVIAN STATISTICS.

According to a detailed statistical summary in a recent issue of "Peru Today" the foreign commerce of that republic in 1913 represented: Imports, \$30,443,884; exports, \$45,668,890. Exports thus exceeded imports by about 50 per cent. During the last 10 years imports have increased by 40 per cent. In the exports, copper, cotton, sugar, petroleum, silver, rubber and wool held the leading places in the order quoted, rubber standing sixth, with 6,130,163 pounds, valued at \$3,971,054. The figures show a reduction in 1912 of 12½ per cent. in weight and 40 per cent. in value.

PERUVIAN RUBBER EXPORTS DURING YEARS 1904 TO 1913.

	Pounds.	Value.
1904	4,896,571	\$3,261,421
1905	5,598,780	4,447,913
1906	5,678,352	4,599,565
1907	6,677,091	4,645,670
1908	5,547,521	2,962,862
1909	6,177,083	5,536,512
1910	5,843,632	6,222,666
1911	4,758,503	2,979,244
1912	7,039,266	6,715,896
1913	6,130,165	3,971,055

The government has endeavored to meet the difficulties arising in the *montaña* region through the heavy fall in rubber by a tax of 8 per cent. on the exports of the article through the port of Iquitos. This tax will be paid on the cost of production, on a basis established by an official board. A reduction is contemplated in the duties on rubber exported from the Madre de Dios territory, or through the port of Mollendo, in proportion to the prices of the London market.

CHANGE IN PERUVIAN EXPORT DUTIES.

With a view to meeting the conditions due to the fall in rubber, the Peruvian government has placed the tax on rubber from Iquitos at 8 per cent. on the cost of production, to be fixed by a joint official board. It is likewise proposed to lower the duties on rubber exported from the Madre de Dios river district, or through the port of Mollendo, making same proportionate to the prices quoted in London.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

RUBBER AND BALATA NOTES FROM DUTCH GUIANA.

By Our Regular Correspondent.

THE European trouble is having a most disastrous effect on both rubber and balata undertakings. It is believed, however, by the rubber growers in the colony that the war is a blessing in disguise and that prices will be increased in the course of time. However true this may be, the present outlook for both industries is decidedly black.

Mention was made some time ago that a French combination with headquarters in Paris had formed a company to exploit certain wild rubber tracts, and that a capital of five million francs [\$965,000] was to have been invested in this undertaking. It is most regrettable to have to record the fact that soon after the war broke out the promoters cabled to the colony saying they were compelled to withdraw their engagements owing to the unsettled state of the financial market. As the matter now stands the owners of these wild rubber tracts have to look about them for new investors. The United States is the only country at the present time that can produce capital, and it would be wise for the proprietors of these concessions to open negotiations with capitalists in that country. I have been informed that the lands are favorably situated and in close proximity to the capital of the colony. A railroad runs through the heart of the properties, and daily communication can be reckoned on. Transportation is cheap and rapid. There is about 74,310 hectares of land (a hectare equals 2½ acres) on which wild rubber trees grow, and an average of 14 trees per hectare has been found on examination.

The plantations that grow Para rubber, cocoa and coffee have suffered considerably since the war broke out, especially those whose products are shipped to Europe. The prices of cocoa and coffee have been extremely low, and local consumption is limited to a very few kilos per month, the bulk of produce having to be stored up against a rise in price and neutral bottoms to export the product.

It seems most unfortunate for Dutch Guiana just at this time, when the colonial crops are so plentiful and the weather conditions so favorable, that no adequate market can be found. The government statistics show that 660,578 kilograms [1,453,272 pounds] of balata was produced from January to October, 1914; 1,078,757 kilograms [2,373,265 pounds] during the same period in 1913.

There is at the time of writing more than 200,000 kilograms [448,000 pounds] of balata in the bush awaiting transportation to town, but it is said the concessionaires prefer leaving it there rather than to incur the expense of bringing it in. As I have mentioned before in previous correspondence, balata can be bought right in Paramaribo for only a few American cents per pound. There are no purchases, however, for there is no ready money. The article will deteriorate by the end of two years. If balata is kept too long and confined to a closed room, it generally becomes shrunken and loses weight.

It is interesting to mention that the majority of merchants and others in the Colony are eager to become better acquainted with American business methods. In fact, the majority of the people in Paramaribo favor United States enterprise in preference to any other, and hope that trade relations—on an extensive scale—will spring into being between the two countries.

The Government's rubber enterprise—Plantation Sloopwijk—will, in the near future, be a large producer of rubber. Many thousands of florins have been expended annually on this estate and the Government feels so certain of success that a further large amount has been voted for expenses in 1915. No less than fl. 90,859.33 [\$36,343.73] is to be expended. Here are some of the chief items in the estimate:

Immigration expenses	fl. 17,621.20	(\$7,048.48)
Labor	fl. 41,650.00	(\$16,660.00)
Plant material	fl. 300.00	(\$120.00)
Building	fl. 3,000.00	(\$1,200.00)
Salaries, management, overseers, etc....	fl. 11,640.00	(\$4,656.00)
Sick nurses, etc.	fl. 4,250.00	(\$1,700.00)
Tools and implements.....	fl. 4,000.00	(\$1,600.00)
	fl. 82,461.20	(\$32,984.48)

Sloopwijk comprises 284 hectares under cultivation. The principal products are *Hevea Brasiliensis*, coffee, cocoa and bananas. The reports from this undertaking constitute a feature of interest, as showing the progress made in various cultivations. The rapid and healthy growth of the rubber trees and the satisfactory tapping returns all go to prove that in the near future—should the price of rubber increase—this undertaking ought to bring in to the Government handsome returns on the capital invested.

FRENCH COLONIAL COTTON.

According to the bulletin of the French Colonial Cotton Association the following was the cotton production of the French colonies for the years 1912 and 1913, under the auspices of the association:

	1912.	1913.
Senegal	pounds. 44,000	16,990
Upper Senegal and Niger.....	220,000	217,252
Dahomey	275,000	385,990
Ivory Coast	87,421
New Caledonia	363,000	567,666
Tahiti	33,000	34,804
Algeria	396,000	264,000
Madagascar	7,700
Total	1,338,700	1,574,123

Above figures do not include the returns from Indo-China, which colony is not under control of the association.

FINANCING THE EGYPTIAN COTTON CROP.

The Egyptian cotton crop has been estimated as 800,000,000 pounds, being above an average yield. About 100,000,000 pounds of last year's crop was carried over. These conditions are naturally felt in Egypt, cotton forming that country's only source of wealth. Egyptian banks have been accustomed to import yearly from \$50,000,000 to \$75,000,000 in gold to move the crop, but after the outbreak of the war gold imports practically ceased. It was then decided that the National Bank of Egypt should make advances to the planter, holding the cotton as security and issuing notes against it of the same value as gold. This plan would enable the cultivators to hold their cotton for eventual realization when the international market becomes more settled.

INDIAN COTTON CROP OUTLOOK.

The 1914 Indian cotton acreage has been estimated at 14,710,000 acres as compared with 14,833,000 acres in 1913-14 and 12,095,000 acres in 1912-13. The crop is thus considered as likely to equal the banner one of 1913-14.

Samples received in France from Morocco indicate the value of that country as a base of cotton supplies. Continuous drought has affected results in Algeria. Good progress has been made in Dahomey, but the opening up of the northern part of the colony by railway must precede any important development in that quarter.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED NOVEMBER 3, 1914.

- N**O. 1,115,514. Pneumatic tire. F. S. Dickinson, New York, N. Y.
 1,115,548. Rubber tired wheels. W. J. Kent, New York, N. Y., assignor to Revere Rubber Co., Chelsea, Mass.
 1,115,566. Wheel tire. A. A. Picard, New York, N. Y.
 1,115,667. Vehicle wheel. F. A. Guth, Waverly, Ohio.
 1,115,702. Inhaling device. W. Luxmore, Chicago, Ill.
 1,115,734. Resilient balata ball. L. T. Petersen, Youngstown, Ohio.
 1,115,875. Tennis shoe. N. F. Towsley, Watertown, and C. H. Roper, Belmont, assignors to Hood Rubber Co., Watertown—all in Massachusetts.
 1,115,908. Internal bath apparatus. M. A. Dees, St. Louis, Mo.
 1,115,920. Vehicle wheel. L. S. Flatau, St. Louis, Mo.
 1,116,009. Composite sole and soling material. G. E. Butterfield, West Newton, Mass.
 1,116,014. Hot water bottle. M. B. Clarke, Akron, Ohio.
 1,116,018. Rampboot hat covering. P. Collagan, East Newark, N. J.
 1,116,101. Skiving machine. E. Nall and W. C. Tyler, assignors to The Goodyear Tire & Rubber Co.—all of Akron, Ohio.
 1,116,120. Wheel tire for road vehicles. R. Reid, Glasgow, Scotland.
 1,116,141. Buoy comprising an envelope made of rubber cloth. L. W. Skoldberg, New York, N. Y.
 1,116,256. Automobile wheel tire. L. S. Flatau, St. Louis, Mo.

Trade Marks

- 57,698. R. D. Bogue, Cincinnati, Ohio. An arrow with the word *Arrows* over it. For chewing gum.
 67,458. Franklin Caro Co., Richmond, Va. The words *Coca-Cola*. For chewing gum.
 67,698. The Savage Tire Co., San Diego, Cal. A tire with an Indian's head in the center over the word *Savage*.
 77,252. Revere Rubber Co., Providence, R. I., and Chelsea, Mass. A diamond design enclosing the word *Nu-Eut*. For arch supports for boots and shoes.
 79,911. New York Belting & Packing Co., New York, N. Y. The word *Pohano*. For sheet rubber machinery packing.
 79,507. Block Brothers Clothing Co., St. Joseph, Mo. The words *Rain Arrows*. For waterproof coats.
 79,716. Maryland Rubber Co., Baltimore, Md. Miniature sketch of Atlas supporting the earth, and the name *Atlas*. For bathing caps and gloves.
 79,717. Maryland Rubber Co., Baltimore, Md. Sketch of Atlas supporting the earth, and the name *Atlas*. For air beds, cushions and pillows.
 79,814. C. B. Kirkpatrick, Newark, N. J. The word *Fulite*. For rubber repairing compounds and adhesive cements.
 80,285. Wm. Wingley Jr. Co., Chicago, Ill. An illustration of a double-headed spear. For chewing gum.
 80,286. Wm. Wingley Jr. Co., Chicago, Ill. The word *Doublemint*. For chewing gum.
 80,547. Plymouth Rubber Co., Canton, Mass. The words *Kempe*. For fabricated soles for boots and shoes.
 80,689. Thermoid Rubber Co., Trenton, N. J. The word *Fordoid*. For rubber casings, inner tubes, liners, etc.
 81,553. W. B. Price, Poughkeepsie, N. Y. The word *Perpetite*. For a waterproofing compound in paste or liquid form for use on fabrics, etc.

ISSUED NOVEMBER 10, 1914.

- 1,116,393. Foldable life preserver. M. Despot, Dayton, Ohio.
 1,116,462. Storm rubber. J. L. Moran, Corning, Cal.
 1,116,464. Dual tire rim construction. E. H. Myers, assignor to The Firestone Tire & Rubber Co., both of Akron, Ohio.
 1,116,550. Car. G. C. Piddle and L. R. Buys, both of Akron, Ohio.
 1,116,683. Hot water bottle. A. C. Fegers, New York, N. Y., assignor to The Goodyear's India Rubber Glove Manufacturing Co., New York, Conn.
 1,116,795. Slitting machine. J. A. Cameron and C. B. Birch, assignors to Cameron Machine Co., all of New York, N. Y.
 1,116,866. Tire wipage machine. J. W. H. Dew, London, England.
 1,116,825. Syringe. C. E. Kells, New Orleans, La.
 1,116,835. Device for raising sunken vessels, which includes a pair of inflatable ballast members. J. S. Norman, Great Falls, Mont.
 1,116,868. Saliva ejector with flexible elastic tube. A. A. Anzelewitz, New York, N. Y.
 1,116,913. Portable sink. T. R. Peregoy, assignor to D. C. Ammidon and H. J. Varran, all of Baltimore, Md.
 1,116,932. Jacket for hot water bottles. J. J. Schwartz and L. R. Strauss—both of New York, N. Y.
 1,116,939. Spine tire. J. J. Shipley, Tampa, Fla.
 1,116,954. Machine for cutting strips from web material. C. H. Thordarson, Chicago, Ill.
 1,117,007. Adjustable hand stamp. W. Dowling, New Haven, Conn.

Trade Marks.

- 70,907. Lee Tire & Rubber Co., Conshohocken, Pa. The word *Zig Zag*. For rubber tires.
 71,188. American Rubber Co., Boston, Mass. An illustration of a bird under the word *Eagle* in a triangle. For rubber boots and shoes.

- 79,06. J. C. Simon and L. Eckert, both of Pittsburgh, Pa. An ornamental design in a square with the initials *S & E*. For footwear made of rubber, etc.
 80,193. R. E. Beckett, Boston, Mass. The words *Safety-First*. For boots, shoes, heels and soles made of rubber.
 80,776. Padgon Thomas Iron Co., Memphis, Tenn. The words *Improved Royal Rubber Roofing*. For rubber roofing.
 81,41. W. B. Price, Poughkeepsie, N. Y. The word *Resist*. For waterproofing composition for fabrics.
 81,533. K. S. Shickluna, Buffalo, N. Y. An illustration of an aeroplane above the words *Over-All*. For tire repairing fluid, rim cement and rubber cements.
 81,888. G. Bergfeldt & Co., assignor to Hanover Vulcanite Co.—both of New York, N. Y. An illustration of a jockey between the words *Polo Club*. For rubber combs.

ISSUED NOVEMBER 17, 1914.

- 1,117,168. Pneumatic knee protector. T. J. Crowley, Long Island City, N. Y.
 1,117,207. Massage device. J. C. Mars, assignor to Fleur De Lis Specialty Co., both of Chicago, Ill.
 1,117,208. Massage device. J. C. Mars, assignor to Fleur De Lis Specialty Co.—both of Chicago, Ill.
 1,117,210. Flat valve. F. A. Mathys, Schenectady, N. Y.
 1,117,327. Water bottle. M. B. Clarke, Akron, Ohio.
 1,117,469. Fountain pen. O. G. Wiseman and E. R. George, both of Des Moines, Iowa.
 1,117,472. Spring tire. H. J. Augustine, assignor of one-half to R. S. Litchfield—both of Independence, Kan.
 1,117,481. Vehicle tire. J. T. Clark, Provo, Utah.
 1,117,526. Process of making a puncture sealing composition. G. E. Seely, Redwood City, Cal.
 1,117,530. Tire cover comprising alternate layers of rubber and textile material. R. Strong, Yarnborough, England.
 1,117,571. Life saving suit or garment. E. F. Hickman, assignor of one-half to A. Munden—both of Norfolk, Va.
 1,117,620. Semi-automatic winding machine. A. H. Adams, Brussels, Belgium, assignor to Western Electric Co., New York, N. Y.
 1,117,688. Packing comprising strips of rubberized fibrous material. M. Montgomery and H. M. Stewart, both of Philadelphia—and assigned to Montgomery Brothers, Inc.—all in Pennsylvania.
 1,117,691. Inflatable tire protector. C. E. Myers, Detroit, Mich.
 1,117,725. Artificial limb with inflatable socket cushion. A. E. Tullis, Fargo, N. D.
 1,117,774. Brake and brake liner. W. T. Bonner, assignor to The Asbestos Brake Co.—both of Trenton, N. J.
 1,117,803. Apparatus for forming pneumatic tires. M. A. Dees, assignor of one-half to The American Tire Co.—both of St. Louis, Mo., and one-half to The B. F. Goodrich Co., New York, N. Y.
 1,117,839. Resilient composition. A. J. Guidry, assignor of one-third to J. May, and one-third to C. Landry—all of New Orleans, La.
 1,117,840. Taper connection for rubber tube. C. F. Hamilton, Portland, assignor to Adjustable Liquid Gauge Co.—both in Oregon.
 1,117,915. Waterproof case comprising rubber gasket. W. W. Schenker, New York, N. Y.

Trade Marks.

- 78,922. Eberhard Faber, New York, N. Y. An illustration of a rule. For rubber erasers, etc.
 80,255. J. P. Southard, Reseller, N. J. The word *Barrett*. For rubber cement.
 80,591. The Ohio Manufacturing Co., Middletown, Conn. The word *Elva*. For dress shields.
 80,619. American Rubber Co., Inc., Jersey City, N. J. The words *Black Jack*. For chewing gum.
 81,672. W. L. McGuire, San Francisco, Cal. The word *Smogon*. For syringes.

ISSUED NOVEMBER 24, 1914.

- 1,117,994. Pneumatic tire. A. J. Freeman, New York, N. Y.
 1,118,122. Automobile tire. J. J. Gish, St. Paul, Minn.
 1,118,130. Shoe. J. C. Hester, Meriden, Conn.
 1,118,149. Rubber fabric and shoe. B. D. P. Co., assignor to The North British Rubber Co., Limited, both of Edinburgh, Scotland.
 1,118,158. Automobile gas bag for motorists. J. R. Gumbert, Akron, Ohio.
 1,118,157. Car tire comprising a liquid filler sleeve. J. W. Pottle, San Antonio, Tex.
 1,118,240. Automobile tire. W. A. Shaffer, Fort Madison, Iowa.
 1,118,306. Resilient wheel with pneumatic tire. John H. Hub, Golden City, Mo.
 1,118,359. Plastic wheel. J. K. Hiler, assignor of one-half to Kittie Collins—both of Chicago, Ill.
 1,118,461. Cushion for inflatable tubes and tires, comprising a series of air tight air cells. M. L. Adler, New York, N. Y.
 1,118,503. Apparatus for forming and vulcanizing rubber articles. N. W. McLeod, assignor to The American Tire Co.—both of St. Louis, Mo.
 1,118,504. Apparatus for forming and vulcanizing rubber articles. N. W. McLeod, assignor to The American Tire Co.—both of St. Louis, Mo.

- 1,118,541. Vehicle tire. J. W. Gannon and W. S. Webber, both of Montpelier, Vt.
 1,118,596. Vehicle tire. J. W. Gannon and W. S. Webber, both of Montpelier, Vt.
 1,118,757. Vehicle tire. J. W. Gannon and W. S. Webber, both of Montpelier, Vt.
 1,118,785. Automobile wheel. J. Laus, Jr., Oshkosh, Wis.
 1,118,786. Pneumatic wheel. J. Laus, Jr., Oshkosh, Wis.
 1,118,800. Pneumatic wheel. H. S. G. and L. Hubert, both of Elizabeth, N. J.
 1,118,801. Pneumatic wheel. H. S. G. and L. Hubert, both of Elizabeth, N. J.

Designs.

- 46,666. Vehicle tire. L. B. Decker, assignor to Rubber & Cellulose Harness Trimming Co.—both of Newark, N. J.
 46,670. Tire. G. W. Greene, assignor to Ten Broeck Tyre Co.—both of Louisville, Ky.
 46,671. Vehicle tire. B. C. H. W. Carter, Ohio.
 46,700. Vehicle tire. C. A. Schwartz, Richmond, Cal.

Trade Marks.

- 75,951. Tyer Rubber Co., Andover, Mass. The word *Tyrian*. For rubber automobile tire and inner tubes and rubber tubing.
 75,996. The Goodyear Tire & Rubber Co., Akron, Ohio. The words *Black Hills*. For rubber packing and machinery.
 78,790. The Fair, Chicago, Ill. The word *Champion*. For rubber garden hose.
 80,317. C. H. Daniels, Chicago, Ill. The words *Safety First*. For boots and shoes of leather, rubber, etc.
 80,730. The B & R Rubber Co., Brookfield, Mass. The word *Armortred*. For rubber soles and heels.
 81,174. The United States Distributing Co., New York, N. Y. The words *Pep Pep*. For chewing gum.
 81,458. A. & A. Rubber Co., South Framingham, Mass. The initials *A. & A. R. Co.* For soles and heels of shoes.

[NOTE. Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of those listed below was in 1913.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 4, 1914.]
 15,560 (1913). Pneumatic feet for typewriters, consisting of hollow rubber balls. Continental Caoutchouc-und Gutta-Percha Cie., Hanover, Germany.
 15,601 (1913). Catheter comprising a dilatable rubber bladder. Ges. G. Wolf, 18, Karlstrasse, Berlin.
 15,623 (1913). Game in which elastic bands are used. F. J. L. Bollhorn, Lauenburg-on-Elbe, Germany.
 *15,764 (1913). Rubber grip for the handle of a golf club, polo stick, or the like. W. H. Sandford, 606 West One Hundred and Thirtieth street, New York, N. Y., U. S. A.
 *15,838 (1913). Sock suspenders. B. W. Parker, New York, N. Y., U. S. A.
 15,878 (1913). Non-slipping attachments of rubber for shoes. J. H. Turner, Golf Club, Denham, Buckinghamshire.
 *15,910 (1913). Spring wheel with continuous outer rigid ring and rubber ring cushions. H. F. Spelschouse, 14 North First street, Philadelphia, Pa., U. S. A.
 15,963 (1913). Air chamber of a pneumatic tire. E. Brueck, 16, Rendagasse, Pilsen, Austria.
 16,033 (1913). Rubber composition for the manufacture of tires, etc. J. F. Monnot, 49, Old Broad street, London.
 [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 11, 1914.]
 16,100 (1913). Stocking supporters. R. H. Wall and H. Wall, Limited, 4, Love Lane, Wood street, London.
 16,234 (1913). Tire consisting of segmental rings of alternate wood and rubber blocks in staggered arrangement, seated on a rubber bed. S. T. Richardson and R. Price, 3A, Rea street, Birmingham.
 16,241 (1913). Wheel tire. R. Reid, 50, Logan street, Polmadie, Glasgow.
 *16,288 (1913). Sock suspenders. A. T. Sanders, Chicago, Mass., U. S. A.
 16,316 (1913). Non-slip rubber pad for pedals, etc. W. B. Wright, 65, Woodgrange Road, Forest Gate, London.
 16,360 (1913). Spring wheel with rubber ring cushions. J. A. Bartz, 6, Kommandantenstrasse, Gross-Lichterfelde-West, Germany.
 16,372 (1913). Apparatus for drying india rubber. Bertrams, Limited, St. Katherine's Works; R. F. Gillespie, 58, Arden street, and P. M. Mathew, 7, Ravelston Park, all in Edinburgh.
 16,422 (1913). Golf bag comprising rubber disc. North British Rubber Co., Ltd., 11, H. C. Castle Mills, Leamington, Edinburg.
 16,423 (1913). Tire consisting of segmental rings of alternate wood and rubber blocks in staggered arrangement, seated on a rubber bed. S. T. Richardson and R. Price, 3A, Rea street, Birmingham.
 16,424 (1913). Tire consisting of segmental rings of alternate wood and rubber blocks in staggered arrangement, seated on a rubber bed. S. T. Richardson and R. Price, 3A, Rea street, Birmingham.
 16,425 (1913). Tire consisting of segmental rings of alternate wood and rubber blocks in staggered arrangement, seated on a rubber bed. S. T. Richardson and R. Price, 3A, Rea street, Birmingham.

- 16,618 (1913). Parcel post siphon heel with conical rubber valve plug. D. M. W. S. Limited, and J. W. Feargus, Enfield Road, Acton, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 18, 1914.]

- *16,647 (1913). Valve with rubber face. G. Hart, 1150 Erie avenue, Williamsport, Pa., U. S. A.
 16,665 (1913). Detachable heel with rubber layers. E. A. Lancaster, 273, Brunswick street, Nelson, Lancashire.
 *16,689 (1913). Spring wheel with continuous outer rigid ring and pneumatic cushions. W. G. Chipley, Third National Bank Building, Atlanta, Ga., U. S. A.
 16,697 (1913). Rubber covered bottle for animals. C. Allen, 35, North Frederick street, Dublin.
 16,728 (1913). Coagulating latex. A. E. Berry, "Abbotsleigh," Wandsworth, Essex, and A. Boake, Roberts & Co., 100, Carpenter's Road, Stratford, Essex.
 16,730 (1913). Rubber reinforced button hole for cellulose and like wearing apparel. M. Berger, 32, Neustiftgasse, Vienna.
 *16,972 (1913). Elastic fabrics. W. Kops, Bretton Hall, Eighty-sixth street, New York, N. Y., U. S. A.
 17,007 (1913). Rubber heel pad. W. J. Luxmoore, care of Messrs. Bridges, Savell & Co., 23, Red Lion Square, London.
 17,029 (1913). Balata belts with leather strips. J. Dawson & Son, Leather & Balata Works, Boultham, and A. Waddington, 32, Pennell street—10th in Lincoln.
 17,045 (1913). Segmental rubber tire sections. J. Whiteley, 7, Avondale street, Esmund Road, Cheetham Hill, Manchester.
 17,075 (1913). Feeding bottle. H. Johannes, Bucht-Strasse, Bremen, Germany.
 17,099 (1913). Rubber horseshoe pad. E. F. Clewer, Stoke Pound, Bromsgrove, Worcestershire.
 17,102 (1913). India rubber buffer or like springs, particularly for railway vehicles. C. W. C. Hine, "Moleway," Dorking, Surrey.
 [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 25, 1914.]
 17,152 (1913). Stocking suspenders. F. Boltze, 6, Niederwaldstrasse, Dresden, Germany.
 17,193 (1913). Synthetic caoutchouc substances and intermediate products. H. Dreyfus, 69, Schutzenmattstrasse, Basle, Switzerland.
 17,195 (1913). India rubber. G. Bernstein, 49, Rue St. Georges, Paris.
 17,198 (1913). Collecting latex. J. R. Brown, Glugur, Penang, Straits Settlements.
 17,208 (1913). Tread blocks of hard rubber secured by screws. J. M. O'Brien, 10, Rydal Road, Streatham, London.
 *17,339 (1913). Toys with rubber springs. M. R. Chesney, Meny Building, Kansas City, Mo., U. S. A.
 17,506 (1913). Spring wheels with pneumatic cushions. S. A. Bhisey, 10, Airedale Road, High Road, Chiswick, London.
 17,582 (1913). India rubber, etc. L. Feval and J. de La Fresnaye, 2, Avenue St. Philibert, Paris.
 17,592 (1913). Rubber heel support. F. J. Wood, 3, Rawes street, Burnley, Lancashire.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

- 471,639 (March 16). Interchangeable heel. A. A. Chaussée.
 471,795 (May 4, 1914). Plastic product for use with all descriptions of wheel tires. C. A. Prada.
 471,826 (March 9). Protective cover for vehicle wheel tires. R. Royard de Lamotte.
 471,852 (May 6). Perfected vulcanizing press. A. Lambrette.
 471,853 (May 6). Improvements in vulcanizing presses, boilers and similar appliances. A. Lambrette.
 471,857 (May 6). Mudguard for all kinds of vehicles. C. Giefing.
 471,874 (May 6). Improvements in manufacture of tires. R. Strong.
 471,913 (July 22, 1913). Process intended to separate vulcanized rubber from fabrics and from metallic and similar portions to which it adheres or with which it is mixed. J. Frydemane.
 471,996 (July 23, 1913). Process for regeneration of vulcanized rubber. J. Frydemane.
 472,051 (March 21, 1914). Improvements in wheels. E. F. Goodyear.
 472,052 (March 21). Improvements in wheels. E. F. Goodyear.
 472,167 (May 13). Pneumatic wheel fitting without air chamber. E. Dive.
 472,219 (May 14). Improvements in bicycle air chambers. D. H. C. Russell.
 472,186 (May 17). Appliance for immediately detaching the internal pressure of a tire and particularly of a pneumatic tire. L. Badois.
 472,215 (May 18). Improvements in machines for making objects or substances composed of rubber or other adhesive material and fiber. The Azalay Syndicate, Limited.
 472,245 (May 15). Mass of rubber and products obtained therefrom. E. Franz.
 472,264 (May 15). Elastic wheel tires for automobiles or other road vehicles. A. Tawan.
 472,268 (May 16). Apparatus for vulcanizing soles of footwear. F. A. Antoni.
 472,339 (May 18). Manufacture of a solid elastic body. "Pneumelastium" Company, Limited.
 472,345 (May 18). Mudguard for all kinds of vehicle wheels, specially adapted to automobiles. F. Malraux.
 472,349 (May 18). Elastic tire for wheels. M. Miller.
 472,349 (May 18). Cover for pneumatic tire and other purposes. Gova Tire Company, Limited.
 472,344 (March 4). Improvements in the manufacture of carcasses of pneumatic tires. The India Rubber & Rubber Co.

472,489 (April 29). Pneumatic mechanism for all automobile vehicles. A. Vincent.

[NOTE: Partial copies of specifications of French patents can be obtained from R. B. B. International Counsel, 16, Avenue de Valenciennes, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

- 280,111, Class 39b (October 11, 1913). Process for manufacture of artificial sponge. Philipp Roder Braun, Reich, Alt-Ges., Wien.
- 280,197, Class 39b (April 16, 1913). Process for treatment of synthetic substances, resins, rubber, chlorol through polymerization of butadiene and its homologs. Badische Anilin- und Soda-Fabrik, Ludwigshafen am Rhein.
- 280,198, Class 39b (January 1, 1914). Process for accelerating the vulcanization of natural or artificial rubber. Farbentabellen vorm. Friedr. Bayer & Co., Leverkusen b. Köln.
- 280,482, Class 63c (November 27, 1913). Pneumatic tire. A. W. Livingston, Oakland, Cal.
- 280,483, Class 63c (November 9, 1913). Appliance for indicating escape of air from pneumatic tires. Automobilwerk Max Schachtschabel & Co., Halle a. S.
- 280,484, Class 63c (November 26, 1913). Anti-skid appliance for tires. T. J. Clark, Portland, Ore.
- 280,596, Class 12c (May 28, 1911). Process for production of isoprene. Badische Anilin- und Soda-Fabrik, Ludwigshafen am Rhein.
- 280,660, Class 45f (December 3, 1913). Rubber tapping tool. Jules Bosch, Kheorinan, near Manomajaya, Java.
- 280,763, Class 71c (September 20, 1913). Apparatus for vulcanizing shoe soles. Friedrich August Antoni, Köln.
- 280,848, Class 39a (November 13, 1913). Process for separation of rubber, gutta percha or balata from the latices containing these gums. D. Heinrich Collosens, Regensburger Strasse, 27, Berlin.
- 280,959, Class 39b (March 21, 1912). Process for production of rubber. Farbentabellen vorm. Friedr. Bayer & Co., Leverkusen b. Köln.
- 280,988, Class 45f (October 25, 1913). Apparatus for tapping rubber and other trees. Georg M. von Hassel, Bezener Strasse, 6, Berlin.
- 280,944, Class 63c (October 5, 1913). Cellular tires, air cells of which are in connection with the open air. Adolf Böttcher, Hammerdeich, 106/110, Hamburg.

GERMAN PATENTS IN FRANCE.

In the matter of French patents issued to Germans, a number of manufacturers in the south of France have urged on the government the unwisdom of the proposed drastic measures as being likely to cause retaliatory action in Germany, the patents issued to French inventors in Germany and Austria possessing special value which they would thus soon lose. French manufacturers appreciate the value of German patents, while in number they may be less than those issued in France to German inventors.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

THIS is the season when dullness is most apparent in such chemicals as are used in common in the paint and rubber trades.

The "Massepequa," en route from Germany, is bringing 58,300 pounds of lithopone and 12,654 pounds of chemicals. The "Matanzas," which was chartered here by a syndicate of dye and chemical importers and dealers, arrived with a full load of 3,000 tons of dyes, chemicals and medicines, and is returning for another load. The oil tanker "Sun" arrived on November 29 with 4,100 tons of German chemicals, etc. Recently the "El Paso" has been chartered for the return trip by a firm of chemical importers. She sailed from here with cotton. The steamer "Albatross" is also expected to arrive about the first of the year with a good sized cargo.

It is customary to add 25 per cent. to the bills for chemicals arriving from Germany on account of the war. The charge on the first cargo of the "Matanzas" was \$35 per ton.

The German government will allow of the exportation of dyes and chemicals and medicines only in American steamers consigned to American importers who guarantee that they will not be diverted to the use of its allied enemies.

The English government has again prohibited the export of aniline oil, and the price has soared to 50 or 60 cents per pound. The United States imported 115,951 pounds of aniline oil in October, and exported 3,000,000 pounds of zinc compounds.

It is reported that a plant for producing dyes and chemicals will be built by the Benzol Products Co., which is controlled by

Barrett, who also controls the coal tar industry in the United States, the General Chemical Co., who are large manufacturers of chemicals, and the Somo-Solvay Co., who are in control of the Solvay process of producing coke in by-product ovens, and make immense quantities of tar and benzol. The plant is to be built at Marcus Hook, Pennsylvania, and will employ 1,000 men.

The imports by England and Germany of antimony sulphide and oxide on the contraband list. This will prevent shipments through the customary channels and result in consignments being made in a roundabout way, causing higher prices. Imported barytes will also go higher, as advices have been received by New York agents of European houses that no more supplies will be shipped.

THE RUBBER SCRAP MARKET.

IN the early days of the month collections of boots and shoes were light, which caused dealers to look for higher prices. It was, however, understood that there were some large stocks of waste, which would affect the possibilities of an advance. Dealers were paying $7\frac{3}{8}$ @ $7\frac{1}{4}$ cents and getting $7\frac{3}{8}$ @ $7\frac{3}{4}$ cents from the mills. Rumors of sales, or offers, a little later in the month, at 8 cents were not confirmed. In the closing days of the month it becomes evident that for good-sized lots reclaimers will have to pay 8 cents. Some business has been proposed to collectors by dealers at the equivalent of the price offered by the mills. The future of the waste shoe market depends in a large measure on the extent of crude rubber importations.

Trimmed arctics are firm. Auto tires have realized $4\frac{5}{8}$ @ $4\frac{3}{4}$ cents, though the quantity handled at latter price is doubtless limited. Dealers have been offering \$4.20@4.50. Solid tires have realized $4\frac{1}{2}$ @ $4\frac{3}{4}$ cents from mills, and bicycle tires $3\frac{1}{4}$ cents. Inner tubes have been held firmly, dealers paying 23 cents for No. 1, and getting from mills about 24 cents. Accumulations of tubes are being held by dealers.

Collections from the West are coming in slowly, and dealers are looking for higher prices from that quarter. In Boston the advances on crude rubber led to a firm tone in No. 1 tubes. Collectors in Philadelphia have not been sending in much material. Scrap rubber dealers, while meeting with a dull trade, are looking for better times in 1915.

RUBBER SCRAP PRICES PAID BY CONSUMERS FOR CARLOAD LOTS.

New York, December 30, 1914.

October, 1914.....	70,774	5,731
First 10 months of 1913.....	4,906,970	672,261
First 10 months of 1914.....	4,056,071	393,737

NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS.

The usual quarterly meeting of the National Association of Waste Material Dealers was held on December 15 at the Hotel Astor, New York, under the chairmanship of President Birkenstein, when various subjects were taken up, including the advance in freight rates on certain lines of waste materials. The report of the Western Traffic Committee referred to the fact of the old classification having been restored, under which combined shipments of metals, rubber and rags can be made.

CONSERVATION OF WASTE.

In his recent address at the Pittsburgh Publicity Association, Newell J. Lewis, general manager of the Pennsylvania Paper Stock Co., quoted a statement of Theodore Hofeller, of Buffalo, who has been thirty years in the waste business, as to rubber waste. The latter authority had estimated that during the year 1915 10,000,000 automobile tires would be manufactured in the United States, which, when worn out, would realize \$10,000,000, on the basis of 5 to 6 cents per pound. The general advantages of the utilization of waste were forcibly presented by Mr. Lewis.

BALTIMORE FIRM CHANGES NAME.

With quarters still at 428 East Saratoga street and 428 Falls Way, Baltimore, the firm hitherto known under the name of H. Klaff & Co., will in future be styled the "National Metal and Pipe Supply Co." It will carry scrap iron as well as rubber and other waste products.

SOME AUTOMOBILE NOTES.

The United States exported during the first nine months of 1914 20,167 automobiles—637 commercial, valued at \$1,066,545, and 19,530 passenger at \$17,209,964—and parts, exclusive of engines, and tires, to the amount of \$4,451,163. This is a slight decrease from the figures for the same period in 1913, when a total of 20,953 vehicles were exported, worth \$20,301,858, and parts valued at \$4,448,792. The total export of automobiles for the fiscal year ending January 30 last reached \$40,000,000. Imports into the United States up to October 1, 1914, included 186 automobiles, worth \$293,601, with parts, exclusive of tires, \$698,624.

It is estimated that there will be made in Canadian factories during 1915 36,000 cars of United States design, the predicted production there of Fords alone being 30,000. Canada's imports of automobiles from the United States for the first nine months of 1914 totaled 3,854 cars, against 5,260 for the same period in 1913.

Three hundred automobile trucks have recently been purchased in Chicago by representatives of the Russian government, 200 three-ton and 100 five-ton.

The Massachusetts Highway Association received during the fiscal year ending November 30 last fees for automobile registration and licenses amounting to \$925,964, an increase of \$700 over the receipts for the previous year. During the year there were registered 77,246 cars, against 62,660 for the previous fiscal year, and the licensed drivers increased from 81,144 to 99,532. The amount received in fees will be expended for road maintenance and improvement.

A "Made in the U. S. A. Industrial Exposition" will be held at the Grand Central Palace, New York, March 6 to 13, in the movement to establish the "Made in the U. S. A." slogan or national trade-mark and increase American industry and trade. This exposition is intended to show "American Made" and "American Grown" products in practically all branches of business.

The report of the agricultural station of Annam says that the ten trees in the station in Hué which have served for experimental purposes do not develop freely. Their progress is not very satisfactory, and it seems that the climatic conditions of Central Annam differ too much from those in their native country.

Review of the Crude Rubber Market.

AS a result of embargo conditions, New York prices have advanced during December both for Para and plantation grades. In the former, the month opened at 70@71 cents, the price remaining within about a cent of that figure until the 16th, when it attained 73@74 cents. On the 18th it further advanced to 75@76 cents, at which it remains.

First latex crepe stood on December 1 at 75@76 cents, from which point it rose by the 15th to 78@80 cents, and by the 18th to 85@87 cents, at which it has since remained.

The month is closing with a quiet market, small stocks, prices steady and few buyers. The manufacturers are not in the market, and any evidence of buying would result in advanced prices. Stocks of plantation grades are especially small, and the only cargo afloat is on the "Ghazee," now due to arrive. This was the last ship to leave Singapore after the embargo went into effect. Para stocks from Brazil are arriving regularly. About 3,000 tons have arrived during the month.

The Booth Line steamship "Denis," from Manaos and Para, is due in New York December 29, with 950 tons. The Lloyd Brasileiro steamship "Sergipi," calling at Para, is due in New York January 10, with 270 tons. The Booth Line steamship "Boniface," from Manaos and Para, is due January 12 with 690 tons.

All of this rubber was sold in advance, and therefore will not affect prices on arrival.

The report that large quantities of rubber are being shipped from Para to Italy is not confirmed. A small lot of 43 tons was shipped via New York, but encountered difficulty in transshipping at this port. Another lot of 28 tons was shipped to Italy from Para by way of Rio de Janeiro. As Italy's embargo is in force, this rubber cannot eventually arrive in Germany.

Prices of plantation rubber in London were normal at the first of the month: First latex crepe, 2s. 1½d. [52.2 cents]; ribbed smoked sheet, 2s. 4½d. [57.77 cents]. The market has held steady since then, with a tendency towards lower figures. Latest advices show but little change, with first latex crepe at 2s. 0d. [48.65 cents], and ribbed smoked sheet 2s. 3d. [54.73 cents].

"Macson" says stocks look small, but reminds the trade of the large quantities of rubber seized by England at Gibraltar and the north of Scotland. One small sale of this rubber has recently been made in Liverpool by order of the Prize Court brokers. Latest advices mention that the only market feature is the unusually large shipments to Canada.

Singapore auctions are held regularly with a good demand for all grades. "The India Rubber Journal" reports large business done by growers for direct shipment to America, and deplores the diverting of London's trade.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "The easier rates and improved demand for commercial paper, noted in my last report for the latter part of November, have continued through December with further ease, the best rubber names going at 4½ to 5 per cent., and those not so well known 5½ to 6½ per cent."

Arrivals of Guayule rubber for the nine months ending September were 1,075,676 pounds, valued at \$440,262, against 4,675,798 pounds, valued at \$2,043,813, last year. Imports of gutta percha for the nine months were 1,757,516 pounds against 381,131 pounds in same time last year, and 612,708 pounds in 1912.

Singapore.

General & Co. report [November 18, 1914]

The rubber market in Singapore has been very quiet since the 1st of November, owing to the fact that the United Kingdom has been closed to rubber imports from the United States, and the market has been very quiet since the 1st of November.

At the end of the week, the market was somewhat better, and the price of the standard grade was 11.50 cents, and the price of the first grade was 11.00 cents. The price of the second grade was 10.50 cents, and the price of the third grade was 10.00 cents.

The market was very quiet since the 1st of November, and the price of the standard grade was 11.50 cents, and the price of the first grade was 11.00 cents.

Plantation Rubber from the Far East.

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to November 16, 1913 and 1914. Compiled by the Ceylon Chamber of Commerce.)

To	1913.	1914.
Great Britain	12,233,999 pounds	15,940,685
United States	5,320,411	9,108,791
Belgium	3,358,739	2,984,009
Australia	417,593	571,773
Germany	237,657	1,037,415
Japan	222,605	226,301
Straits Settlements	97,120	42,535
Italy	42,488	1,772
Austria	30,097	—
France	15,682	320,152
Russia	11,301	105,212
India	1,381	1,050
Holland	992	—

Total 21,990,065 30,339,695

(Same period 1912, 11,586,700; same period 1911, 5,195,619.)

To arrive at the approximate quantity of Ceylon rubber exported for 1914 to date, deduct the quantity from the total exports. In previous years the exports of Ceylon rubber only were given.

The export figures of rubber for 1914 in the above table include the imports re-exported, viz., 3,317,075 pounds.

TOTAL EXPORTS FROM MALAYA.

(From January to dates named. Reported by Barlow & Co., Singapore.)

These figures include the production of the Federated Malay States, but not of Ceylon.)

STRAITS SETTLEMENTS RUBBER EXPORTS.

A cable received by the Malay States Information Agency from the Colonial Secretary, Singapore, states that the export of plantation rubber during the month of October amounted to 2,006 tons as compared with 1,602 tons in the previous month and 1,144 tons in the corresponding month last year.

The following table gives the comparison month by month for three years:

	1912.	1913.	1914.
January	253	784	1,181
February	274	743	1,703
March	427	898	1,285
April	387	762	1,548
May	431	814	1,309
June	398	812	1,480
July	720	1,120	1,584
August	597	1,315	1,325
September	550	1,057	1,602
October	—	1,144	2,006

BALBUSE GUM DUTIABLE.

The Assistant Secretary of the Treasury has instructed the Collector of Customs, New York, that "Balbuse Gum" which has been imported free as crude rubber, has been washed, cleaned, dried and pressed into sheets for convenience in handling and transportation. It will be therefore be subjected to a duty of 15 per cent. under paragraph 385 of the tariff of the 3rd of October, 1913

or products not as good as
 at to be? Probably I can
 how to make them right.
 anyway.

THE TROPICAL AGRICULTURIST and Journal of the Ceylon Agricultural Society

The Tropical Agriculturist (fully illustrated) is now an official publication with special scientific papers in addition to many of its old features.

Edited by R. N. Lyne, F. L. S., F. R. G. S.
 Director of Agriculture, Ceylon.

Rubber Cultivation and the Chemistry of Rubber form one of the features of the Journal; full information on Ceylon and Malay Peninsula methods and progress. All about Tea, Coffee, Cocoa, Tobacco, Cinchona, Cinnamon, Fibre Plants, Coconuts and other Palms, Citronella, Lemon Grass and Essential Oil Grasses, and all tropical products.

Rate of Subscription for America, including postage:

YearlyIn advance \$5.00

The Tropical Agriculturist circulates throughout the world, especially in the Tropics, and is a first class advertising medium.

Full particulars re Advertisements on application to

THE EMBARGO COMMITTEE.

THE Embargo Committee, in expressive American phraseology, "made good." From its inception the membership was full of promise. Headed by the capable and energetic president of the Rubber Club, Mr. Hodgman, an able second was found in the president of the Rubber Association. Mr. Bruyn is somewhat new in rubber, but his firm, Littlejohn & Co., for years have been factors in other Ceylon products and knew every condition in New York, London and the Far East. Then, too, Mr. Marks long ago proved himself a far-seeing and brilliant forecaster of rubber events, with a genius for action at exactly the psychological moment. Mr. Hotchkiss, although new to rubber committees, fitted into the delicate and arduous work with an ease that bespoke the natural diplomat. Nor would it be fair, in viewing the personnel of this important body, to forget the quiet, effective worker who furnished the world with the news of the committee's progress—Secretary Vorhis. The Rubber Club is to be congratulated in having the timber from which to build such an efficient committee.

THE RUBBER TRADE ON GUARD.

THE serious manner in which the rubber manufacturers have taken up the obligation to play fair with England in the matter of crude rubber is in every way admirable. The great majority not only have pledged themselves not to resell or reship rubber received under the lifted embargo, but they have gone further. The special committee which has been formed to detect and report upon any attempts at a violation even of the spirit of the agreement with Britain has not only a minute knowledge of rubber export and import conditions, but is abundantly supplied with just the sort of assistance that the circumstances require. With the reputable manufacturers and importers thus standing together and on the alert, it will be difficult for any to break the compact—if indeed there are any so disposed.

ENGLAND NEED NOT FEAR SENDING TOO MUCH RUBBER.

IF our English friends have been afraid to ship us rubber lest we get too much and yield to the temptation of re-shipment to the enemy, they can quiet their fears at once, for there is no possibility of such a contingency. We can use all the rubber that they can spare us. Last year the manufacturers of the United States consumed about 60,000 tons of crude rubber, one-half of this large volume coming from the East. In all probability the present year will see an increased consumption—provided we can get the rubber—of at least 15 per cent., or a total of about 70,000 tons. Assuming that the Eastern production reaches 70,000 tons during the current twelve months, we will doubtless be able to use one-half of it, or more.

To illustrate, there is the tire industry. There are now in operation in this country 1,600,000 motor vehicles of one sort or another, and it is a fair estimate to say that they will need between now and next January an average of six tires each, which means a consumption of nearly 10,000,000 tires. It is quite true that many people who had hoped to own a pleasure car may have to forego that ambition for another year because of general financial conditions, but as against that the motor car will be used this year more than ever before for purely utilitarian purposes. The farmer, for instance, has found that his automobile is quite as necessary as his team of horses.

Again, the demand for rubber from the footwear manufacturers will be unusually large—not that up to the

present time our winter has been marked by extreme severity, but simply because of the general cleaning up of stocks by foreign orders. Then the increase in railroad rates recently granted by the Interstate Commission has already stimulated the demand for railroad equipment, and some of the trans-continental lines are arranging new financing on a large scale to supply such equipment—which means, of course, more hose and more packing.

It can be very safely said that we not only can but will use all the rubber England can spare us, and that there will be no surplus to be attracted abroad by unusual financial offers on the part of the enemies of the Allies—even if there were any American dealers disposed under present conditions to make such sales.

A WONDERFUL CHANCE TO CLEAN UP.

ONE does not need a lively sense of credulity to believe current reports that the makers of rubber boots and shoes have been enjoying a chance without precedent to clean up. With millions of men in the field, fighting, sleeping and living in trenches in mid-winter, it is obvious that the first requisite for preserving health and maintaining fighting fitness is waterproof footwear; and it is equally obvious that the belligerent governments have been in no position to wait for their orders to follow the ordinary manufacturing routine but must take what they could get quickest. If there are manufacturers of rubber boots and heavy shoes who have not cleared out their surplus stock it would appear to be their own fault; certainly fate could not have been kinder.

Emptying the warehouse does not in the least signify the working off of damaged or inferior goods. There is no other line of manufacture on earth where it is so impossible to foretell the future demand as it is in the rubber footwear industry. Who can say in July whether the coming January will bring five feet of snow or glow with springtime balm, with pedestrians complacently going about in pumps? Both contingencies must be provided for. If the blizzards come, well and good—every rubber finds its leather sole-mate; but if the snow fails, many cases must stay in the storehouse for another season. But that means no appreciable deterioration, where the goods have quality to start with. So the soldiers of the Allies, who have depleted American surplus stocks as probably they were never depleted before, are not wearing discards, but are comfortably and serviceably shod.

This unprecedented foreign demand explains, in part

at least, why, with disappointing winter conditions at home, rubber dividends have been earned and rubber shares rule strong.

HOW WOULD IT WORK OUT?

“IMMEDIATE action by the United States Congress prohibiting absolutely the importation of British rubbers or products thereof or any kind of manufactured rubber goods into the United States.”

That was the whimsical suggestion made in all good faith in the columns of the daily press by an ardent, if injudicious, friend of the American rubber trade—in case England did not forthwith lift the obnoxious embargo.

The idea evidently was that if our English friends would not let us have what rubber we needed now, we would have none of their rubber in the future, and that it should be left to pile up in their warehouses until it decayed of old age. But how in reality would it have worked out? If a British embargo for two months proved so troublesome, what would be the effect of an American embargo declared for an indefinite period? Would restrictions emanating from Washington be any less onerous than those originating in London? If withholding needed supplies for a few weeks caused us so much distress, what would be the result of a permanent prohibition? It was declared in the midst of the embargo, by several manufacturers, that if it were continued very much longer our supply, which normally should be 60,000 tons a year, would be cut down to a paltry 35,000 tons, that workmen would be laid off in all our factories and that there would be a marked and universal increase in the cost of rubber goods. How would this unhappy situation have been relieved had Washington added its embargo to that of London?

As a matter of fact, had Congress ever attempted such a measure and rubber prices had gone up fifty or seventy-five per cent., would not the army of a million and a half tire users, to say nothing of other consumers of American rubber goods, have swept down on Congress like an avalanche, demanding the instant repeal of the rubber prohibition?

Fortunately, the situation did not call for extreme measures and the suggestion quoted above, which appeared in a number of papers, was probably never seriously entertained by our national law makers—even though they have at times shown a marked penchant for fantastic legislation.

WOULDN'T SOME PHILIPPINE RUBBER HAVE BEEN MOST CONVENIENT?

PROBABLY never before in its history has the rubber trade of America been so impressed with its absolute dependence upon foreign sources of supply as during the two months of the English embargo. With all British sources closed to us and all the other sources quite inadequate for our needs, what a relief it would have been to the situation if there had been a few hundred thousand acres of bearing rubber trees somewhere on American soil—in the Philippines, for instance! It is close to seventeen years now since Commodore Dewey remarked nonchalantly "You may fire when ready, Gridley"—and the Philippines passed under our control. What progress in rubber planting might not have been made in that time, instead of the few paltry, feeble experiments which have constituted our total rubber planting achievements in those islands.

However, it must be confessed that, with one of the great political parties evidently bent on handing the Philippines over, bag and baggage, to the head-hunting Moros at the first possible opportunity, the inducement for American capital to enter upon Philippine development has not been altogether irresistible.

WHAT RUBBER GOODS COST THE BREWER.

WHILE the article appearing on later pages of this issue on "The Uses of Rubber in the Brewery" will doubtless prove of interest as showing the multifarious purposes for which rubber is used in the brewing industry, information as to the amount annually expended by brewers for rubber goods is of more material interest. Figures courteously placed at our disposal by members of the brewing trade enable us to furnish this information, at least approximately.

Three brewers, the aggregate of whose sales for last year was 1,769,780 barrels, purchased during that period rubber goods of all kinds—hose, packing, etc.—to the value of \$74,813. During the latest year for which authentic returns are available—the fiscal year ending June 30, 1914—the brewers of the United States produced and sold 66,105,444 barrels of malt liquor.

This output is likely to be increased, at least to the extent of the greater part of the 146,549 barrels of beer imported from Austria, Germany and Belgium during the last fiscal year. This, during the continuation of the war, the home brewers will doubtless have to supply.

Assuming that in the production of this aggregate the total purchases of rubber goods were in the same

proportion to output as the figures given above—not an unreasonable hypothesis, considering that the processes and apparatus employed by brewers are essentially similar—the brewing trade expended, during the twelve months here quoted, in round figures, \$3,000,000 for rubber goods.

THE RUBBER CLUB'S ANNUAL BANQUET.

THE Rubber Club of America, since its inception as the New England Rubber Club, has enjoyed an unbroken series of mid-winter banquets. It is interesting and significant to note that in the minds of the club members the last banquet has always been the best. 1915 has proved no exception to this rule. Instead of calling the club members together and feasting sumptuously themselves, they feasted by proxy; that is, they sent money to the sufferers in the great war. The supposititious attendance at this banquet was about 20,000.

An imaginative illustration of this Sixteenth Annual Banquet appears on another page.

THE PASSING OF A PIONEER.

IN the death of J. C. Harvey, Mexico loses one who did much for the betterment of all those with whom he came in contact. His efforts to help the planters in Veracruz and Oaxaca, his plans for botanic stations on the Isthmus of Tehuantepec, his essays, journeys, counsels—all for the betterment of the Americans and English who had settled in the "hot country"—will not soon be forgotten. His frail body could not stand the energy of his eager pioneer spirit, and he has gone, but from pen to planter those who remain will long hold him in loving remembrance.

SAID A MANUFACTURER OF RUBBER GOODS WHO IS ONE OF the big buyers of crude rubber: "I do not like the word boycott, but as soon as I learn that any rubber importer or broker is sending crude rubber out of the United States I intend to drop him for good and all. I shall do this because in encouraging embargoes he is directly working against my interests. He should protect his customers, not handicap them. As far as I can learn, that is the feeling of many other manufacturers as well."

AFTER A LAPSE OF SEVERAL MONTHS WE ARE DELIGHTED to welcome again that excellent review "Le Caoutchouc & la Gutta-Percha"—back numbers and all. We trust that this means that the publication is to be continued.

In a brief note explaining the delay the publishers say: "Events having deprived us of many collaborators and workers, we have not been able to give our review its usual importance. We therefore request our friends to excuse us, as we are reorganizing rapidly to overcome this difficulty."

The Rubber Industry in France.

IT is to a Frenchman that the civilized world owes its earliest knowledge of india rubber and the peculiar properties to which its value in the arts and industries is due. In 1735 Charles Marie de la Condamine, a French military officer, visited South America for the purpose of making astronomical observations. Having concluded his work in Peru, he determined to return to the east coast by way of the Amazon River. This he did, traveling overland to the Andes Mountains and following the course of the various affluents of the Marañon and Amazon across the then unexplored continent. He returned to France in 1743, and in a paper that forms part of the history of the Royal Society of France for 1745 gives an interesting account of his travels. He refers particularly to "cauchou," the modern rubber, and describes the bottles, syringes, etc., the natives made from this remarkable substance.

In the history of the Academy for 1751, there is published another paper by M. de la Condamine, devoted entirely to rubber, in which he gives further particulars in regard to "caoutchouc" and describes the travels and researches that led to the discovery of the trees from which the South American natives extract the gum, in the French colony of Guiana. Illustrations of the tree, its foliage and fruit and of the method of tapping it, accompany this paper.

While thus, from the scientific standpoint, a leading place in the history of the rubber industry belongs to France, the name "caoutchouc" being in itself a reminder of the fact, the growth of the rubber manufacturing industry in that country has been slow compared with its progress in other lands. This may be in part ascribed to the tendency of the French manufacturers to specialize in certain lines, thereby neglecting or losing sight of opportunities offered in other fields. Small articles, such as toys, tobacco pouches, articles of female apparel, elastics, etc., have largely occupied the attention of the French manufacturers, whose pre-eminence in their production is reflected in the character of their exports. For the more serious lines of mechanical rubber goods, the army and navy and the great railroad corporations have been the largest customers, private buyers, such as manufacturers and others, preferring the products of foreign countries, notably of Germany and England. The production of hard rubber articles, on the other hand, has been brought to a high degree of perfection in France, Paris carrying on this business extensively, especially in connection with scientific and surgical instruments, mouthpieces for pipes, toilet goods, etc.

The manufacture of crude rubber affords a practical criterion

as to the growth of the French rubber manufacturing industry. In 1836, France imported 72,000 pounds of crude rubber, in 1862 the quantity entered had increased to 1,800,000 pounds, in 1870 it was 2,500,000 pounds, and in 1890 upwards of 4,000,000 pounds. In the year 1900 the imports of crude rubber were 6,285,314 pounds, and while some of this was re-exported in an unmanufactured state it was for the greater part used in French factories.

The manufacture of rubber goods was established in France as an industry in 1828, the Michelin rubber-goods factory at Clermont - Ferrand, dating from that year, being the oldest in that country. This concern was also a pioneer in the manufacture in France of rubber tires and rubber goods for flying machines. For the reason above stated and because there was less call for rubber goods in

A TYPICAL FRENCH FACTORY.

France than in many other countries, the progress of the industry has been gradual, and it has never attained the same importance as in England and Germany.

An important factor in the encouragement of the rubber manufacturing industry in France was the prominence given to rubber at the great exhibition held in London in 1851. The exhibit of Charles Goodyear, who had shortly before perfected his process of vulcanizing rubber, consisting of household furniture, decorative objects, jewelry, culinary and household utensils, toilet articles, clothing, footwear, etc., attracted wide attention and served to show the infinite variety of purposes for which rubber could be used. The accompanying illustration shows the Goodyear exhibit at the following international exposition, held in Paris in 1854, which was similar to the first in character and comprehensiveness.

One of the lines that early engaged the attention of the French manufacturer was that of rubber boots and shoes. In some parts of France—Brittany for instance—the prevalence of rainy weather led to a steadily increasing demand for rubber footwear and waterproofs. To supply a deficit, rubber boots and shoes were imported and the American article, owing to its superior fit, style and wearing properties, speedily won the favor of buyers. This resulted in a growing importation of the American product which finally attracted the attention of Hiram Hutchinson, who, having established a small rubber manufacturing plant at New Brunswick, New Jersey, subsequently took part in the formation of the Newark Rubber Co. He visited France to arrange for the purchase and exploitation of the Goodyear vulcanization patents on the continent. In 1853, while in Paris, he prospected for an eligible site for a rubber-goods factory and finally decided on a place about three hours' journey from the capital, now known as Langlée in Châlette, near Mon-

targis. The availability of a water-power right and the fact that nearby communities promised plenty of labor were factors in the selection of the site. Here was located the beginning of one of the most important rubber manufacturing enterprises in France, where, in addition to rubber footwear of world-famous excellence, rubber tires and an endless line of rubber goods of every description are made.

In 1869 Hiram Hutchinson, the founder, died, but the concern had already been incorporated and Alcazar Hutchinson, his oldest son, succeeded him. In 1872 Mr. H. P. Moorhouse went over from the United States and reorganized the concern, which assumed the present title of A. Hutchinson & Co. With the decease of Mr. A. Hutchinson, about 1889, the last of the members bearing the name had passed from the firm, and in 1898 Mr. J. Kennedy Smyth, who had been associated with Mr. Hutchinson in the foundation of the enterprise, died. He is believed to have been the last of the original subscribers to the successful concern, which is now conducted as a corporation, with a capital of \$650,000.

French rubber goods factories have steadily increased in productive capacity, due to completeness of equipment, rather than in size or number, the latter part of the nineteenth century witnessing the most important development in the industry, which had reached a highly prosperous condition as early as 1875. In 1863 the Syndicat Professionnel of the india rubber, gutta percha, oil cloth and imitation leather industries was founded, marking quite an important epoch in the rubber trade. Partaking of the nature of a guild, it takes cognizance of customs and freight tariffs, industrial legislation and all matters affecting the interests of the trades it represents. About this time, too, a tendency to generalize in the manufacture of rubber goods developed; the compounding of rubber with other substances and the use of reclaimed rubber and rubber substitutes became more common. This necessitated changes in the machinery and equipment, and while making these alterations manufacturers installed necessary apparatus for extending the scope of their operations and the variety of their productions.

The period immediately preceding the commencement of the war probably witnessed the greatest prosperity in the history of the French india rubber interest. The growth of the automobile industry had lent a notable impulse to the business of manufacturing rubber tires, almost if not quite sufficient to counter-balance the depression that had existed in the mechanical and surgical rubber goods branches; and the year 1914, but for the demoralization of business due to the outbreak of hostilities, would have ended as one of the best the French rubber industry has ever seen. During the past year tires of every description have occupied a conspicuous place in French rubber manufacture. The large and increasing demand from the home market and the facility with which an export trade could be established, has induced many French manufacturers to add tires to their regular output and there has consequently been a large increase in the

number of tire manufacturers in France. Statistics for 1913 show the value of tires exported to have been about \$18,000,000. Figures available for the months of 1914 prior to the war are uncertain, but the incomplete figures published relating to the first half of 1914 show an increase, as compared with the same period of the preceding year.

With the opening of the year 1914 France had at least 20 prominent tire works, but few of these were known outside the country. The few, however, that enjoyed international fame ranked with the foremost companies in existence and were selling their tires all over the world, wherever there are motor cars. The present war between France and Germany was preceded by a fierce commercial struggle between leading German tire manufacturers and prominent French firms. It began with a price policy controversy and terminated in a boycott instituted simultaneously by both sides. The trouble was in part carried into English territory and for a time caused serious trouble in the British tire trade.

At present, the manufacture of tires appears to absorb the greater part of the producing energy of the French rubber industry. The latest French rubber trade directory shows 110 companies, large and small, engaged in the manufacture of rubber tires and hose. Not all are strictly French, some being foreign houses having manufacturing branches in France, and some of the companies referred to as tire manufacturers make them only as a side line. The comparison of this figure with that for other branches of the industry is interesting. There are, for instance, 19 companies manufacturing rubber balls, 3 making tobacco pouches, 40 garters, suspenders, etc., 10 making dress shields, 1 making rubber sheets for copying presses, and 4 making rubber thread. Nearly 30 firms make waterproof cloth and 8 are making rubber footwear. It will be seen that with the exception of mechanical goods, French firms manufacture all lines. There has nevertheless been a large demand for foreign goods which has been met by Germany and England.

From the first named country the imports have amounted to \$4,000,000 a year, so that France has been a good customer of the German rubber industry, while Germany's purchases of rubber goods from France amounted only to about \$1,000,000, mostly

for tires. French manufacturers have made but little systematic effort to introduce their goods, with the exception of tires, into foreign markets. The business that has come to them has been chiefly of a fortuitous character, no French rubber goods manufacturer, outside of a few large firms, having made any attempt to maintain systematic foreign representation. French rubber goods have found only a few years in the past a market in the United States

GOODYEAR'S VULCANITE COURT

and Egypt, but of late these markets have been vigorously contested by Germany, Austria and England, and in one of the most favored of French goods, rubber shoes, Russia has become a keen competitor.

Imports of rubber goods by France include rubber thread, the annual value, normally, of about \$1,000,000, and elastic cloth,

materials to about half this amount. Dress shields are imported to the number of 100,000; garters, suspenders and hose supporters to the value of about \$30,000, and cloth material to the

and are thus able to get in touch with foreign buyers visiting the city, or can readily reach export houses serving the French trade and conducting business especially with South America,

Russia, and what is known as the near-East, meaning the Balkans, Asia Minor and Egypt.

While we may estimate the number of leading firms acting as importers, exporters, wholesale or large retail distributors of manufactured rubber goods in France as from 150 to 200, it is possible that the actual number is much larger and it is difficult to draw the line in such an estimate. There are altogether in France about 50 large firms importing raw rubber, about six being located in Havre and an equal number in Bordeaux. All have branches in Paris, Roubaix, Marseilles and a few other places where markets for crude rubber are desirable.

France, in 1913, imported foreign crude rubber to the value of \$40,345,100 and retains annually a considerable portion of the rubber coming from her own possessions. The exact value of the exports for 1913 is quoted as \$24,405,000, so that about \$16,000,000 worth of rubber was retained for home manufacturing purposes. Imports and exports of crude rubber fell off somewhat during 1914, and figures for the period since the war began have not been made public. For the first eight months of 1914, the French imports of unmanufactured rubber amounted to 29,932,744 pounds, compared with 31,922,736 pounds for the same months the year before.

Havre and Bordeaux are the leading ports of entry for rub-

From Gaul's Tire Corporation, New York.

NOON AT A FRENCH FACTORY

value of \$150,000. Rubber boots constitute an important item in the list of imports, amounting in value to \$200,000. The exports of rubber footwear from the United States to France has reached a total annual value of \$23,667. Tires and hose, constituting the most important item in the French imports of manufactured rubber goods, amounted last year to about \$5,000,000 in value; for the year ending June 30, 1914, the United States sent automobile tires valued at \$5,448 to France and other kinds of rubber tires to the value of \$15,284. Goods manufactured from rubber and other materials, such as belting, hose, packings, etc., were imported by France last year to the value of about \$2,400,000, articles of this class to the value of \$62,319 being supplied by the United States. As against these imports there has been developed a very considerable export trade in a number of lines. The value of the exports of elastic materials, for instance, is about \$6,000,000 a year. Proofed garments are exported to the value of nearly \$2,000,000 and \$100,000 worth of rubber boots are sold abroad. Tires, hose and similar materials to the value of about \$18,000,000 are sent to foreign markets, leaving a tire balance of \$13,000,000 in favor of France, while belting, etc., exported reaches a value of about \$3,000,000.

The depressed condition that prevailed in most of the European markets during the first part of 1914 was not without its effect on the French imports of rubber goods and, to judge from the meagre material at hand, there has been a decrease in most of the import lines. Since the commencement of hostilities there have been, of course, no exports but, all things considered, the industry had done well up to the end of July and had at least kept up the average of the preceding year, the decrease on one side being balanced by an increase on the other.

Paris is the chief seat of French export trade. Most of the leading manufacturers have some form of representation there,

INTERIOR OF A FRENCH FACTORY.

ber in France, Havre taking precedence as regards Para rubber. Of the total imports of rubber by way of that port in 1913, 7,146,839 pounds were Para rubber and 2,495,346 pounds came from the French Congo. The following table gives the imports at Havre in pounds since 1898:

1898.....	5,374,814	1904.....	4,823,664	1909.....	8,335,592
1899.....	4,091,737	1905.....	7,253,338	1910.....	9,828,106
1900.....	5,180,810	1906.....	9,652,603	1911.....	8,836,036
1901.....	4,940,508	1907.....	9,841,334	1912.....	12,350,169
1902.....	4,294,560	1908.....	7,711,690	1913.....	9,859,459
1903.....	4,104,965				

Although Bordeaux does not make quite such a good showing, a considerable quantity of French colonial rubber has found entry through this port, as will be evident from the following figures:

1899.....	387,104	1904.....	2,617,087	1909.....	4,381,693
1900.....	527,972	1905.....	2,493,562	1910.....	5,128,781

France is fortunate in having her own rubber producing territories and is thus, to a considerable extent, independent of outside sources. This places the French industry beyond the danger of lack of raw material and the military authorities will always be able to draw on the large supplies available in the French colonies. Those in which rubber is produced include Cochin China, the French Congo and other French possessions in Africa and Madagascar, which is a French protectorate, and French Guiana. The extent of the rubber producing capacity of these possessions was admirably set forth at the last rubber exhibition in London.

In French Equatorial Africa, wild rubber only is produced. By the careful protection of the rubber producing plants, the output has been largely increased within the past few years, the laws governing the exploitation of the forests being successfully enforced. The fact that the exports increased from 546 tons, with a value of \$400,000 in 1896, to 1,901 tons, of a value of \$3,400,000 in 1912, being evidence of the improvement in quality as well as quantity during the period in question.

The rubber-growing industry in Indo-China is now nearly 20 years old. The colony produces, from native plants, an excellent grade of wild rubber, but by adulterating it with inferior latex the collectors injured its reputation. Rubber planting is now well established on the southern portion of the territory, and good progress is being made by the plantations. *Hevea* has given excellent results, as also have some plants of the *Manihot* class, but *Manihot Glaziovii* and *Castilloa Elastica*, which were tried among others, were given up. In 1911 the exports of raw rubber amounted to 245 tons.

There is also a flourishing raw-rubber industry in Madagascar, the exports, valued at \$400,000 in 1902, having increased to \$1,800,000 in 1910. Recognizing that this rate of increase threatened the exhaustion of the source of supply, the government passed laws controlling collectors and restricting collection, which resulted in a drop in exports to 800 tons in 1911, with a value of only \$1,100,000. At the same time, by educating the natives in the art of collecting without sacrificing the producing plant, the industry was placed on a permanent footing.

From French Occidental Africa, 3,669 tons of rubber were exported in 1913, mostly in the form of plaques or sheets.

In addition to the trade in crude rubber, there is quite a large business in waste or scrap rubber, in the collection and distribution of which about 25 firms are engaged. It is obtained partly in France and partly from abroad, goes to reclaimers at home or in other countries, and is ultimately employed in the manufacture of the cheaper grade of goods. From Germany and the United States French manufacturers have learned the use of reclaimed rubber in the production of low quality goods and American reclaimers find plenty of trade among French manufacturers.

Finally, in the manufacture of chemicals and other ingredients used in compounding rubber a number of firms are engaged and a smaller number make a specialty of rubber manufacturing machinery. French manufacturers are also liberal purchasers of these supplies from German manufacturers and sell the latter some of their specialties; and while this trade is at present interrupted, it will doubtless be revived when the differences between the two nations have been settled.

The advantages of organization for the advancement of mutual commercial and industrial interests have always appealed to the French and rubber manufacturers and allied interests have

not been slow in profiting by them. Various societies are in existence for the promotion of the rubber manufacturing industry, among which may be mentioned the Association Caoutchoutière Coloniale, Chambre Syndicale des Fabricants de Caoutchouc et Gutta Percha, Chambre Syndicale d'Instruments de Chirurgie, Chambre Syndicale des Fournitures pour Usines, Chambre Syndicale des Fabricants de Linoleums et Toiles Cirées, Chambre Syndicale de Pneumatiques, Chambre Syndicale de Tissus Elastiques, Bretelles, etc., and the Chambre Syndicale de Vêtements en Caoutchouc et Sportif.

The value of exports of manufactures of india rubber, from the United States to France, for the past five fiscal years, ending June 30, 1914, has been as follows:

	1910.	1911.	1912.	1913.	1914.
Scrap and off.....	\$30,367	\$105,172	\$119,348	\$161,070	\$25,567

THE WAR'S INFLUENCE ON RUBBER PLANTING.

Discussing rubber prospects at the recent annual meeting, held in London, of the Rubber Share Trust and Finance Co., the chairman, Mr. A. A. Baumann, expressed himself optimistically as to the future of the rubber industry. He said he expected to see rubber producers reduce their costs to about 9d. per pound, which would leave a good margin of profit on growing and make rubber shares a very profitable investment. He stated that a company of which he was chairman had reduced its costs of production to 11d. per pound, with only two-thirds of its area in bearing. He admitted that the increase in production had been attended by a reduction of consumption in some quarters. Allowing that the production of plantation rubber for 1915 would be 85,000, this would be an increase on 1914 of 20,000 tons. Of the 20,000 tons of crude rubber which Germany consumed per year, about 10,000 pounds came from the Far East plantations. As a factor against this surplus of production over consumption, would be the increased demand owing to the war; rubber boots being required for the Russians, rubber sheets and garments for the combatants of other nations and by all tires in enormous quantities. In the meantime, he pointed out that supplies from Brazil and Africa are diminishing and that countries that had formerly obtained their rubber from those sources were drawing, to an increased extent, on British plantation growers. He suggested that a possible excess of supply over demand be met by storing the surplus against a period of shortage and thus providing for a future regulation of the market, which, he urged, was quite feasible, as rubber does not deteriorate by keeping.

RUBBER ON SEIZED VESSELS.

Among the articles seized by the British authorities as contraband of war may be mentioned 222 packages of raw rubber, valued at \$21,414, forming part of the cargo of the Norwegian steamer "Sigrun," bound from New York to Malmo and Gottenburg, Sweden, and taken into Newport, England, by a British cruiser; 200 cases of crude rubber from the cargo of the "Saudedjord," a Norwegian vessel bound from New York to Copenhagen, Denmark, that was taken into Halifax, Nova Scotia, and all the rubber in the cargo of the "Virginia," a Danish vessel bound out from New York and compelled to discharge the rubber in her cargo at Newcastle, England, on suspicion that it was intended for an enemy of Great Britain. In other instances, the vessels detained were allowed to retain the rubber in their cargoes, it being evidently not intended for use inimical to Great Britain.

The Rubber Embargo Lifted, Conditionally.

NOT in many years, in fact it might be said never before in the history of the American rubber industry, has it been confronted with so serious a situation as that which existed during the weeks of the British embargo on plantation rubber. It was a situation fraught with tremendous possibilities of hardship and distress for the entire American rubber trade. There have been attempts in former years to corner the crude rubber supply but never of a character to prove menacing to the trade, but here was a practical corner which had behind it the resources of the whole British Empire, and its operation and effectiveness depended not on the ability of any man or set of men to maintain it but upon the will of the British Government. It is not to be wondered at, therefore, that the leaders of the American rubber manufacturing and importing trade bestirred themselves early to discover some speedy means of relief.

When the war broke out, on the 30th of July, there was at once created a condition of uncertainty as to rubber supplies from foreign parts, and prices rose with great rapidity during the first few days of August; but when it became clear that the Allies would have practical control of the seas and that supplies would not be shut off through the activity of Germany and Austria, prices immediately resumed their normal level. Late in October, however, England declared an embargo on shipments of all rubber from British colonial ports to any port outside of England. This in itself did not threaten serious trouble to the American manufacturer, but when, following close upon this localized embargo, came rumors of a general embargo against exportation of rubber not only from British colonial ports, but from any English port, conditions were immediately changed.

The Rubber Club of America and the Rubber Trade Association of New York did not wait for official confirmation of this general embargo rumor, but began to take steps at once to insure for the American trade its necessary supply of rubber. On November 2 a joint Embargo Committee was appointed by these two organizations, composed of George B. Hodgman, president of the Hodgman Rubber Co. and also president of the Rubber Club of America; William E. Bruyn, of L. Littlejohn & Co., president of the Rubber Trade Association of New York; Arthur H. Marks, of The B. F. Goodrich Co., and H. Stuart Hotchkiss, of the General Rubber Co. and also representing the United States Rubber Co. When, on November 13, the embargo on rubber shipments from London was officially proclaimed, the Embargo Committee began action at once to relieve the situation. Its members visited Washington and had many sessions with the State Department, but were not able to make much progress in this direction. It was discovered that greater headway could be made by taking the matter up directly with the British Ambassador, Sir Cecil Spring-Rice. They found the Ambassador not only willing but anxious to assist them. They had eager coadjutors also in the Rubber Growers' Association and Rubber Trade Association of London, the latter association also appointing an Embargo Committee, consisting of the following members: Arthur Meyer, of Arthur Meyer & Co., Limited; Edmund Stevenson, of Aldens' Successors, Limited; Andrew Devitt, of Lewis & Peat, vice chairman of the Rubber Trade Association of London, and Charles Bower, of Edward Till & Co. The interests of the members of these associations lay, naturally, in the direction of maintaining normal crude rubber relations with the United States. But despite the efforts of the committees on both sides of the water it was impossible to report real progress during the uncertain, not to say anxious, weeks of November and December.

Some members of the trade affected to believe that the embargo would be of short duration, that England was simply stocking up. But others realized that unless England could have

positive assurance that no rubber exported from London to American ports would ever find its way back in any form to her enemies the embargo would continue indefinitely. And it was generally agreed that England was absolutely within her rights in this matter, for it was obviously essential for her to deprive Germany of all supplies. To be sure this meant distress and possibly ruin to British planters in the East, but distress and ruin are the incidents of war and in this case would weigh but little in the mind of the English statesmen, realizing as they did that this was a war in which the prestige, if not indeed the very life of the British Empire, was at stake.

In addition to the work of the two committees, one in New York and the other in London, the larger rubber interests on both sides of the water were exerting every possible influence they could bring to bear for the relief of the situation. The Embargo Committee of the two American organizations not only did excellent work in presenting the situation so clearly and persistently to the British Ambassador, and through him to his government, but it performed a notable service in keeping the members of the Rubber Club informed of every step that was being taken, and also in interesting the whole American public in the matter by frequent letters through its secretary to the daily press. In the meantime it was drawing up tentative drafts of such guarantees as the members of the American rubber trade were willing to give the British Government.

Finally, late in December, the committee believed that the best and quickest way to bring the matter to a satisfactory conclusion would be to send a suitable representative to London to confer with the rubber men of that city, and with the officials of the Government; and Mr. Bertram G. Work, president of The B. F. Goodrich Co., was selected for this extremely important mission. He sailed on the "Lusitania," which left New York on December 30. Mr. Frank A. Seiberling, president of the Goodyear Tire & Rubber Co., also sailed on the same ship, going unofficially and simply in his personal capacity as one of the leading American rubber manufacturers.

Meanwhile a tentative plan had been formulated in London which enabled Mr. Work so to expedite matters that on January 8 he was able to cable the Embargo Committee of the Rubber Club that the British Government would permit exports of rubber from London to the United States under certain guarantees, the tenor of which he also cabled. This same information was furnished to the public on the same date by the British Ambassador, who gave the following statement to the press:

"Arrangements have been practically completed whereby dealers and manufacturers in the United States can obtain supplies of rubber from the British Empire.

"Manufacturers wishing to obtain large shipments will be required to give a bond through their agent in London.

"In other cases shipments will be allowed to approved manufacturers and dealers who signify their willingness to sign appropriate guarantees. Shipments will be addressed to a bank in New York, which will not deliver the rubber until the purchaser has signed and deposited guarantees with his majesty's Consul General at New York and he sanctions delivery."

The statement also contained, briefly, the details of the guarantee which manufacturers and importers would be called upon to sign.

It was first stated that the larger American manufacturers would be able to have crude rubber shipped direct to them on the filing of a bond by accredited agents in London, but it was evidently thought that this would lead to many complications and might, in fact, be somewhat prejudicial to the smaller manufacturers and importers, for the official guarantee forms as brought over by Mr. Work on his arrival on the "Lusitania,"

January 23, omit all reference to the necessity of giving bonds in London and place all manufacturers and importers on the same footing. These official forms are printed below, form No. 1 being that which the manufacturer is called upon to sign

and form No. 2 being the importer's guarantee, which bears on the back the additional guarantee of the purchaser of the rubber from the importer. These forms are so clear in their wording that they require practically no comment. They are as follows:

THE MANUFACTURER'S GUARANTEE.

Ex s s.

In consideration of your consenting to the delivery to us of the rubber specified in the margin, we,

hereby give you the following undertaking, which shall remain in force so long as Great Britain is at war with any European Power.

We will not export from the United States any raw rubber, reclaimed rubber, or waste rubber, whether the same has been imported from the British Dominions or not, otherwise than to the United Kingdom or to a British Possession.

We will not sell the rubber now delivered by you to any dealer or other person or persons in the United States, but will use it for our own manufacturing purposes.

All orders received by us for manufactured or partly manufactured rubber goods to be sent to neutral European countries shall be executed from stocks maintained by us in the United Kingdom or be executed by shipments to the United Kingdom and reshipment from there under licence to be obtained for export therefrom.

We will not execute any orders for manufactured or partly manufactured rubber goods to be sent either directly or indirectly to any country or State at war with Great Britain.

We will not sell any manufactured or partly manufactured rubber goods to any person in the United States without satisfying ourselves that there is no intention on his part to export or resell the same for exportation to any countries in Europe other than Great Britain, France, or Russia, otherwise than by shipping to the United Kingdom and reshipping from there, under licence to be obtained for export therefrom.

If we export any manufactured or partly manufactured rubber goods to a destination outside Europe not being in a British Possession, we will, prior to or simultaneously with the shipment, give you particulars of the goods so shipped and their destination.

All rubber tyres exported by us or sold by us for export shall bear a distinctive name or mark, which we will communicate to you, so as to identify them as being our manufacture.

I beg to inform you that I have sold the rubber specified in the margin to whose guarantee you will find on the back hereof. I will produce to you at any time on demand the original contracts or other documents evidencing the sale.

In consideration of your consenting to the delivery to them of the said rubber, I undertake that I will not, directly or indirectly, at any time so long as the present war continues, export any raw rubber, reclaimed rubber, or waste rubber from the United States, except to the British Dominions, and that I will not sell any raw rubber, reclaimed rubber, or waste rubber for exportation without satisfying myself that it is not intended for exportation from the United States, except to the British Dominions.

[163-2]

GUARANTEE OF PURCHASER FROM THE IMPORTER.

His Britannic Majesty's Consul-General,
New York.

In consideration of your consenting to the delivery to us of the rubber specified on page 1 which we have purchased from we

hereby give you the following undertaking, which shall remain in force so long as Great Britain is at war with any European Power:—

We will not export from the United States any raw rubber, reclaimed rubber, or waste rubber, whether the same has been imported from the British Dominions or not, otherwise than to the United Kingdom or to a British Possession.

We will not sell the rubber now delivered by you to any dealer or other person or person in the United States, but will use it for our own manufacturing purposes.

All orders received by us for manufactured or partly manufactured rubber goods to be sent to neutral European countries shall be executed from stocks maintained by us in the United Kingdom, or be executed by shipments to the United Kingdom and reshipment from there, under licence to be obtained for export therefrom.

We will not execute any orders for manufactured or partly manufactured rubber goods to be sent, either directly or indirectly, to any country or State at war with Great Britain.

We will not sell any manufactured or partly manufactured rubber goods to any person in the United States without satisfying ourselves that there is no intention on his part to export, or resell the same for exportation, to any countries in Europe other than Great Britain, France, or Russia, otherwise than by shipping to the United Kingdom and reshipping from there, under licence to be obtained for export therefrom.

If we export any manufactured or partly manufactured rubber goods to a destination outside Europe not being in a British Possession, we will, prior to or simultaneously with the shipment, give you particulars of the goods so shipped and their destination.

All rubber tyres exported by us or sold by us for export shall bear a distinctive name or mark, which we will communicate to you, so as to identify them as being our manufacture.

Date.....

Two facts will be noted in connection with these guarantees. One is that all this rubber is shipped direct to the British Consul General in New York, who alone has authority to release it. The second interesting fact, as shown in the manufacturer's guarantee, is the obligation the manufacturer, the moment he buys any rubber from London, puts himself under regarding not only that particular rubber but all the rubber, whether manufactured or unmanufactured, that he may have on hand and may dispose of during the continuance of the war.

It is stated that a commission is to be appointed in London, consisting of three men not connected with the rubber trade, who shall regulate the operation of London shipments. It has been stated in the press that this commission is to consist of Lord Balfour, Russell Rea and Henry Birchenough, but this statement has not been officially confirmed.

There may be a few members of the American rubber trade who will look upon the stipulations of the required guarantees as rather harsh, but the general opinion is that the British Government has done all that could be expected of it under the circumstances. Mr. Hodgman, of the Embargo Committee, is quoted in a recent issue of the "New York Sun" as follows:

"We have no fault to find with any of the stipulations in the British announcement. We are willing to give whatever bonds are required by the British authorities, and further, we are determined to see to it that no other dealers violate the conditions. We want the rubber for the manufacturers in this country. The local trade this year will be very large and there need be no fear that the legitimate rubber trade of the country will think of doing anything contrary to the express conditions of the British announcement."

Mr. Hodgman, in this interview, undoubtedly expressed the general consensus of opinion.

The first rubber shipped from London under this conditional suspension of embargo consisted of 200 tons, which arrived on the "Lusitania" January 23. It was expected that the "Menominee," with 1,500 tons on board, and the "Minneapolis," with 1,000 tons, would sail during the last week of January, but both of these boats have been temporarily detained at London by the dockmen's strike. It is believed, however, that they will very soon be released.

The outlook for the American rubber trade is most encouraging. The plantation product for the current year should amount to 80,000 tons. In 1913 the Allies—England, France and Russia—only consumed 38,000 tons. To be sure, with the gigantic operations now going on in the field, there will probably be a larger consumption of rubber on the part of these three countries, notwithstanding the great falling off in many of the ordinary uses of rubber in times of peace. But it is hardly probable that the Allies would need over half, or much more than half, of the plantation yield—which would leave, let us say, 40,000 tons for American consumption during 1915; and this, with the South American supplies, will undoubtedly be ample.

There is just one other point that may be mentioned, namely, that the suspension of embargo is only during good behavior, and if the British Government should discover any London-shipped rubber making its way, either unmanufactured or manufactured, to the enemy, the embargo would be put in force again instantly. Undoubtedly during November and December some

rubber, both in the crude and manufactured state, found its way from American ports to Germany. It was smuggled out of the country under false manifests—not, it need hardly be said, by any responsible and recognized member of the trade. The fact that some rubber shipments have been made from United States ports to German purchasers is generally conceded. But the Rubber Club of America and the Rubber Trade Association have determined to spare no efforts to assist the State Department and the Treasury Department in preventing any such shipments in the future, and it is exceedingly improbable that any further rubber exports in any form will be made from this country to the enemies of the Allies.

MEETINGS OF THE MOTOR AND ACCESSORY MANUFACTURERS.

The twelfth annual meeting of the Motor & Accessory Manufacturers was held in New York at the Waldorf-Astoria, January 6, when, in addition to the transaction of other business, directors were elected to succeed those whose terms had expired. E. H. Broadwell, of the Fisk Rubber Co., Chicopee Falls, Massachusetts, was among those elected for a three-year term. H. T. Dunn, of the same company, declared himself unable to accept re-election. The meeting was followed by a banquet.

A meeting of the board of directors was held on January 7, when the following officers were elected for a term of one year: President, F. H. Lovell, Jr., of the Lovell-McConnell Manufacturing Co., Newark, New Jersey; first vice-president, C. W. Stiger, of the Stromberg Motor Devices Co., Chicago; second vice-president, C. E. Thompson, of The Electric Welding Products Co., Cleveland, Ohio; third vice-president, T. J. Wetzel, of The Dyneto Electric Co., New York; treasurer, L. M. Wainwright, of The Diamond Chain & Manufacturing Co., Indianapolis; assistant treasurer and secretary, A. P. Sloan, Jr., of the Hyatt Roller Bearing Co., Newark, New Jersey.

REPORT OF GUAYULE GROWING BY AKRON SYNDICATE NOT CONFIRMED.

Statements have frequently appeared in the daily press to the effect that an Akron syndicate has made a twelve-year contract with certain large ranch owners near Marathon, Texas, for the right to grow guayule shrub upon their properties and that this shrub is intended to be shipped to Akron for manufacture into crude rubber. The area thus leased is given as several million acres. Inquiries fail to verify report of organization or to identify capitalists described, Akron rubber men regarding the story as part of the publicity program of the land company's promotion scheme.

Work has been commenced on a new factory for the Toledo Ford Tire Co. at Findlay, Ohio. The plans have been drawn to permit of additions to the plant as they become necessary.

At the meeting of the Detroit section of the Society of Chemical Industry, held December 18, James H. Bogart read a paper on "The Manufacture of Insulated Wire."

Rubber in the Brewery.

By C. E. Bevington.

WHILE there are few industries in which, for one purpose or another, rubber is not used, it would perhaps be difficult to select one in which it is employed for so many uses and is so truly indispensable, as in the brewery.

Dealing at almost every step in the production of beer with fluids, in liquid or gaseous form, the brewer is constantly dependent on rubber for the means of transporting or confining them, while the condition of moisture in which he constantly works makes rubber an indispensable element in much of his apparatus. For the most part, the rubber goods used in breweries are of the sturdy class, strong and substantial, to withstand the by no means gentle usage they are liable to meet with from the heavy-handed brewery workmen; and the proprietors are, in consequence, keenly alive to the necessity for high-grade material and plenty of it, and reliable workmanship, in purchasing this class of supplies.

Although there is no lack of rubber goods manufacturers who, catering constantly to the trade, are familiar with the uses to which rubber is put in the brewery and know just what the brewer wants in this line and what he wants it for, there are others to whom the purposes for which rubber is used in the brewing industry are not as familiar, and these may find it worth while to take an imaginary trip through a big modern brewery, with its attendant bottling works, in the course of which they may learn of uses in this connection of which they were previously unaware.

Right at the entrance we note a big hopper, into which a gang of men are busily dumping the contents of sacks arriving in a succession

RUBBER ELEVATOR BELT.

of wagons. This is malt, the body of beer, which is raised into big bins, on an upper floor, whence it descends through the different departments in the course of its transformation into beer. We note at once that the belt of the big elevator is of rubber, the material that best resists the heavy wear and the dust-laden atmosphere in which it works, and which is least liable to generate and conduct electricity. This is, important, as a spark in the atmosphere, loaded with fine, dry dust, may mean a disastrous explosion. The heavy rubber belting is, moreover, least subject to the constant "stretch," which makes "taking up," an operation often necessary with other elevator beltings. Then, again, rubber belting does not require the dressing with oil, etc., that is absolutely essential to the life of a leather belt, and which, in a malt elevator, would be objectionable on account of the sensitiveness to foreign odors, etc., of the brewers' malt.

If "conveyors" are needed to forward the malt into its bin, a rubber belt, to which the necessary "flights" are bolted, is as likely as not to be found doing duty, or the malt is simply discharged onto an endless rubber belt having flanged edges, and running horizontally, that quickly transports the material to its destination.

While on the subject of rubber belting, it may be just as well to dispose of it finally by stating that whether working in dust or an atmosphere overcharged with steam or moisture, the rubber belt is the only belting that meets brewery conditions, hardly any other being used.

RUBBER BELT FOR CONVEYING MALT.

From the storage bins, the malt is weighed out as required and ground or crushed between rolls, in a malt-mill driven by rubber belting, on a lower floor; re-elevated into the ground malt bin, whence it descends as needed into the mash tubs, huge receptacles containing a powerful stirring apparatus, in which it is mixed with the necessary water and extracted. The spent grains, or exhausted malt, are removed by means of a manhole and chute, the ponderous manhole cover being made tight by means of a rubber gasket. Exposed to the action of fluids at a temperature from 212 degrees down and containing a liberal proportion of lactic acid, as well as to the wear of removal and scrubbing once or twice every day, there must be nothing flimsy or "shoddy" in the make-up of these gaskets, and they are specially made with a view to the conditions they are called upon to meet.

From the mash tub, the liquor extracted from the malt—the "wort," as the brewer calls it—gravitates to the kettles on a lower floor, huge copper receptacles, with steam-heating jackets or coils, as a rule, in which the wort is boiled with the hops. Here, again, more big manholes and more gaskets, this time of material capable of withstanding prolonged exposure to boiling heat without softening or imparting any rubbery or other foreign taste to the fluids with which they come in contact.

Cooled by exposure to the air in a great shallow pan, and by trickling over a stack of pipes, through which cooled water or refrigerated brine is passing, or into which the ammonia refrigerant from the ice machine is allowed to expand, producing a temperature much lower than freezing, the beer is then ready for the fermenting cellar.

The joints of these huge return-flow coolers must be made absolutely tight, and there is no other material but rubber that

BREWERS' HOSE.

will insure this. Rubber washers or rings are depended upon to take care of the constant expansion and contraction of metal parts inseparably from the wide fluctuations of temperature in this apparatus. At the same time, they must be of a quality to resist brine, ammonia fumes, cold or hot or mildly acid fluids,

for it can readily be understood that even a small leak that would allow ammonia or some to escape into the beer would be disastrous.

It is when we reach the cellars that the importance of rubber in the brewery is really impressed upon us. Rubber hose squirms and coils on every hand, distributing unfermented beer among the immense vats, carrying the fermented beer from these into storage casks in another cellar, or bringing hot or cold water for the scrubbing and rinsing of the big casks on the floors. Just as the service the hose has

TRENCH'S BOTTLE WASHER.

to perform, so its construction is varied, and special grades are made for every purpose. Brewers' hose is a staple article with the manufacturers of industrial rubber goods, and the accompanying illustration shows the care with which the hose for brewers is built up. The interior tube is made of selected stock, carefully compounded to avoid breakage under pressure or by kinking, etc., for a break in the inner tube of a hose used for carrying beer makes it unfit for further use for that purpose. In the crevice of the break, yeast cells accumulate and decomposing furnish a breeding place for strange ferments, dangerous alike to the durability and flavor of the beverage. Then again it is necessary that this inner tube be of such a character that the acid or alcoholic constituents of beer, passing through or lying in it, will not soften or dissolve it, and cause it to impart a rubbery taste to the beverage. Over the inside tube and the layers of rubberized duck that enable it to withstand the interior pressure, is a special cotton jacket of herringbone weave and high tensile strength, which is caused to adhere to the body of the hose by an intermediate layer of pure rubber, while outside of this woven jacket comes the usual wear-resistant water-tight covering that is called upon to withstand the wear of impact, of dragging over concrete or rough-paved floors, edges of vats, etc., and at the same time to preserve the carrying capacity of the hose intact where it is subjected to sudden bends. It is only proper to say that this particular hose is protected by patents, but every manufacturer of rubber goods of this class has a similar special article for which equal or perhaps superior qualities are claimed, showing the care attached to the production of hose of this kind. When it is stated that the price of such hose runs from 47 cents per foot for 3-ply of $\frac{1}{2}$ inch internal diameter to \$5.60 per foot for 8-ply, 3 inches internal diameter, and that one of the largest breweries in greater New York purchases every year about 500 feet of hose, it is easy to realize the importance to the rubber industry of the United States of the demand for this article alone from the 1,500 breweries.

Another important use for rubber in the cellars is in the gaskets, with the aid of which the manhole covers of the big vats are made to fit tight. The vats or tanks used by brewers for fermenting and storing beer are commonly made of wood—oak, cypress, or white pine—smooth finished inside and coated with a "varnish" made of shellac and other ingredients, dissolved in high per cent. alcohol, which the workmen apply with a brush to the dry interior of the empty vessel; or they are given a coating of "brewers' pitch," a resinous preparation that is sprayed in a melted condition by heated compressed air over the inside of the cask to insure its even distribution. This is necessary to close the pores of the wood, which would otherwise allow the carbonic acid gas to exude and spoil the beer, or these same pores and interstices would become the breeding

place for various ferments which would cause its subsequent deterioration.

In many modern breweries these wooden vessels are now-a-days replaced by receptacles of welded steel, enameled inside and out, which it is claimed are much more durable, easier to clean and less liable to cause infection of the beer by wild ferments.

To afford means for entering these vats for cleansing purposes they are provided with manholes, and between the manhole cover and the wall of the tank a tight joint is effected by rubber gaskets. They are made especially for the purpose, heavy, of good stock and properly formed to fit the covers, for when in place and tightened up they must make a joint that is beer- and gas-tight under all conditions and certain to remain so for any period.

A peculiar foot-covering may be observed in use in the cellars, where rubber boots are always the fashion. It resembles in some respects the "patten" or clog our grandmothers affected and which in the Far East is still worn in wet weather. The lower part or sole of this shoe is of heavy rubber with prominent ridges or deep grooves and it is provided with straps by which it is secured over the ordinary foot covering.

RUBBER SOLED CELLARMAN'S CLOG.

When the brewery workmen enter a varnished or enameled vat for the purpose of cleaning it, it is highly essential that their shoes shall not scratch the flooring of the vat; and in order to avoid this they wear this peculiarly constructed rubber clog, an illustration of which is here shown.

Rubber tips or edges for the shovels, scrapers, etc., used in cleaning these receptacles, are devised for the same purpose—to prevent scratching.

Having completed its fermentation the beer is pumped through hose into the storage cellars, where, in similar receptacles, but in the case of lager beer, hermetically sealed, it remains to

"BOTTLE KLEEN" RUBBER BOTTLE BRUSHES.

ripen and accumulate the wealth of carbonic acid to which it owes its foaming head and refreshing properties. The regulation of the proper volume of gas thus retained by the beer, its retention being dependent chiefly on the pressure it is under, the low temperature maintained and the tight bunging to which

it is subjected, was formerly an important part of the brewmaster's work and called for his unremitting and careful supervision. Of this responsibility he has been, to a certain extent, relieved by modern ingenuity. When his storage cask is full, he inserts in the bunghole the close-fitting rubber-sealed plug of what is known as a bunging apparatus, and it thus becomes part of a system by which all of the casks are connected by means of rubber tubing. While, with the aid of an ingenious contrivance, operating on the principle of a safety valve, but dependent on a mercury column in place of springs or weights for its regulating action, the gas pressure throughout the entire cellar is nicely equalized—or controlled to meet the brewmaster's requirements—according to the degree to which the valves have been adjusted. In other words, the little rubber pipe carries gas from the cask that has too much to the one that has not enough, so that other conditions being equal—uniform liveliness in the beer is insured.

A sudden change in the temperature of the fermenting or stored beer, which may easily be caused by the heat generated during fermentation, or what is less frequent, a drop below the proper fermenting temperature due to excessive cooling of the cellar, may make the "attemperator" necessary. This is a coil of pipe arranged in each tub and connected—again by the omnipresent hose—with the refrigerating plant, or a cold or hot water supply, so that cold water, colder brine, or even refrigerant gas or hot water, can be forced through the coil and the temperature quickly regulated. The necessity for an absolutely tight joint between the attemperator and its hose connection demands a rubber washer that will stand high or low temperature, pressure, etc., and never fail to take up expansion and contraction, as a leak would quickly spoil the beer. So that not only hose, but gaskets, connection washers and tubing of rubber, that are used in the cellar, must be of perfect quality, and upon their reliable excellence the success of the brewer's operations in this important department in large measure depends.

Another department in which rubber comes into its own is the wash-house, where the empty kegs, collected by the drivers, are "relaunders." It is a sloppy place, in which everybody wears rubber boots and rubber aprons, and into it, down inclined skids, rolls a ceaseless stream of kegs, a solid rubber buffer, at the bottom of the incline, modifying the impact of their arrival. They land in a great soaking tank and float carelessly around until their turn comes for the scrubbing machine, where revolving between huge brushes their external toilet is completed. Their rotation is effected by the revolving of the rubber-covered wheels on which they rest, the rubber insuring

the necessary friction and at the same time reducing the shock when the keg is thrown onto the machine. Thence it goes to the rinsing machine. One of its vertical spraying nozzles is entered in the bunghole, the weight of the keg, on a supporting collar, operates a valve that admits water in innumerable jets into its interior, and the washing process is complete. The impact of a heavy keg, dropped with careless suddenness on to the collar, would speedily ruin the valve mechanism, so a rubber bumper is provided to ameliorate the shock. Plenty of hose, with which kegs are rinsed, complete the equipment of this department.

After draining and drying, the kegs are sent to the racking room, where they are refilled by machines designed for the purpose. But after leaving the storage vat, the beer must first be filtered to remove the minute or flying yeast cells, too light to settle by gravity and which would cloud the finished product, or start fermentations

that would impair its quality and appearance. The apparatus used for this purpose is what is known as a filter press, a ponderous device, with numerous plates, forming cells for the filter mass—usually a neutral cellulose substance—through which the beer is forced by powerful pumps, the result being to remove all the suspended solid particles and to leave it perfectly bright and clear.

To prevent leakage between the "frames" or plates they were primarily grooved to receive a packing of rubber, but this was not always satisfactory and, moreover, the prolonged contact between the beer and the frames often resulted in what was known as "metal haze," a dimness impossible of removal and exasperating to the brewer who prided himself on the clarity of his product. So in place of metal a manufacturer made the frames and grates of his filters of hard, vulcanized rubber, which, while stiff enough to furnish the necessary support for the filter material was sufficiently elastic to make a tight joint without the rubber packing. Another firm merely covered the metal frames with vulcanite, retaining the rubber packing, such frames being stronger and cheaper than the all-vulcanite article, both, however, accomplishing the same result—the obviation of contact between metal and beer. Still another form of construction was the hard vulcanizing of the part of the rubber packing that was inserted in the groove in the frame, leaving the exposed part soft and resilient to make a perfect joint. At the point in the frame where the continuous supply channel is located, a good rubber ring is used to insure tight connection.

VENT.

RUBBER BOTTLE BRUSHES

The shipping packages are filled by means of a racking machine in which rubber tubing is everywhere in evidence. In some of these machines the plug, fitting the bung hole, through which the filling tube passes, is of rubber, and by a turn of a wrench is expanded to make it fit closely. The filling tube, sometimes made of hard rubber, extends to the bottom of the package and through it under the pressure developed by its own gas, supplemented, if necessary, by compressed air, the beer enters, filling the package solid with foamless liquid. A void would mean loss of gas and flat beer. When the package is full the filling machine bung is loosened and withdrawn and a wooden bung deftly inserted and hammered down tight.

The bung generally employed is known as a "vent bung," its central portion being so formed as to be readily punched through by the "vent" when the keg is "tapped." The vent is a simple contrivance which admits air to the package as the beer is withdrawn without allowing any escape of gas. It is of iron with a tongue-shaped valve of soft rubber and is driven into place by a few sharp taps of the mallet. When tapping the keg a cup-shaped device of solid rubber through a hole in which the spigot passes snugly is sometimes used to make close connection between spigot and package, and prevent escape and waste of beer. But this is going ahead of our story. Before the filled keg can be removed from the brewery a revenue stamp must be affixed to it in such a manner that the keg cannot be tapped without destroying the

"LIGHTNING"
BOTTLE STOPPER.

stamp. Before they are affixed the stamps must be cancelled as prescribed by the law by means of a dating cancelling rubber stamp, this being the method adopted by Uncle Sam to collect his share of the brewers' profits. When it is stated that the receipts from this source amounted in 1913 to \$66,266,989 it will be realized that this is a by no means unimportant part of the process.

Having duly complied with the Internal Revenue laws the kegs are ready for distribution to the dispensers. For this purpose trucks without end are called into service, no small proportion of the brewers' capital being invested in this means of transportation. Of late, in almost every brewery, the horse-drawn truck has been replaced by the automobile, some of the largest concerns, whose teams were a source of pardonable pride, having replaced them entirely with motors, the saving thereby in property space for stables, wagon space, yard accommodations, etc., being more than considerable. Brewers consequently are among the heaviest purchasers of rubber tires, nearly all of the solid kind, and in many instances the "block" tire, which is preferred as better suited for work in crowded city thoroughfares, and their cost is an item of great magnitude in the brewers' expense account. In the lighter delivery wagons, especially those for the distribution of bottled beers, a heavy pneumatic tire is often used.

Forming part of nearly every modern brewery is a bottling department, which, if not operated by the brewery itself—the case in most instances—is managed by a subsidiary concern in which the brewery is heavily interested. Here again we encounter rubber in many subordinate but none the less interesting forms.

First, as to the bottles themselves. Most of us are familiar with the old-time lever stopper, used as a closure for beer bottles and dependent, for the indispensable tightness of its seal, on a little disc or washer of rubber. The modern cork-lined tin seal or "crown" has largely superseded these stoppers, but many, especially provincial brewers and bottlers, find it inexpedient to make so drastic a change in their plant and equipment as the adoption of the crown-seal involves, and adhere to the old-time stopper. The rubber seal for this must be most carefully made. The material, which should contain not less than about 60 per cent of rubber, should be so compounded as to preserve indefinitely its form and elasticity without becoming soft or sticky under the solvent influence of the beer or owing to changes in temperature. The steaming process, known as "Pasteurizing," which involves the exposure of bottle and contents to a temperature of 140 to 150 degrees for the purpose of killing any ferments present, and to which a large proportion of the beer bottled is subjected, must not affect the "rubbers," as they are termed, nor must they suffer from exposure to soda water and other alkaline fluids used for cleaning purposes.

The bottles received in the bottling house, whether new or old, are invariably treated to a thorough washing. First they are fed into the "soaker," a huge wheel-like contrivance, in which the bottles held in receivers, which in some machines are padded with rubber, are submerged as the wheel slowly revolves in a great tank of hot water. Their inverted position as they emerge allows the water to drain out of them and they then pass to the washing machine. Here they are inverted over an upright nozzle that distributes

McKENNA HOME
BOTTLER.

water in a fine spray all over the interior, while a peculiar little brush or wiper of rubber entering from below and making some 2,000 revolutions per minute thoroughly washes or rather scrubs every part of its interior surface. These rubber brushes are of pliable but durable material and so formed that under the influence of centrifugal force as they are whirled around they reach and scrub every part of the interior of the bottle, even the cleaning of the inside of the neck being provided for by special ribs or fins. At the same time an outside brush of bristles scrubs the exterior, while a powerful spray of rinsing water completes the operation. The washed bottles are grasped by a hand-like device which places them, mouth downwards, in steel draining cups lined with rubber or some other non-absorbent resilient material, a number of these cups being attached to a moving belt on which they travel in endless procession to a point at which they are removed and set aside for refilling. Two of these machines with three men to tend them and the accompanying soaker will perfectly cleanse 35,000 to 40,000 bottles in a day of ten hours. The inconspicuous little rubber brush is an important factor in this operation and has been brought to great perfection. It must be of the most flexible elasticity, resistant to wear, so as not to cause delay by need of constant replacement, non-absorbent and reasonable in cost.

The cleansed bottles go next to the filling machine, which performs its operations very much after the manner of the keg-filler, filling the bottle with solid beer and shutting off the supply automatically when this has been effected.

For bottling beer in the home or even in small breweries where the demand is not constant and machinery would not prove profitable, the McKenna Home Bottler, illustrated herewith, is extensively employed. It is intended for use with the old-time lever or "Lightning" bottle stopper, with the rubber disc seal. It fills the bottle with solid beer, the foam being returned to the package. Both filling and return tube are of rubber and

RING PACKING.

a small tapered rubber plug, supplied with the device, forms a tight seal between the filling tube and the mouth of the bottle and prevents any escape of gas. The bottler shown is made for filling two bottles simultaneously. They are also made for filling one bottle at a time.

It may be in order to refer to a recent change in brewery arrangements that tends to augment the demand for beer-hose. Until a short time ago, in fulfillment of the Internal Revenue requirements, all beer removed from the brewery premises had to be put up in the regular shipping packages and stamped. This had to be done if it was only taken from the brewery next door to the bottling department and entailed much unnecessary labor. This has been changed. A gaged tank is provided in many breweries which is filled, under the supervision of an Internal Revenue official, with beer to be bottled. He assesses the tax in bulk on the number of barrels the tank holds, the necessary stamps are cancelled and the brewer pipes the beer into his bottling works and goes ahead. In many breweries the plant thus described is permanent and copper pipes with flanged rubber-gasketed joints carry the beer from one building to another. In quite a number the transfer is effected by means of a hose.

The filling machine—after the filling tube has been introduced into the bottle—by raising the base on which the bottle stands forces it up against a rubber plug or cap, thus sealing it tight during the filling process and preventing any escape of gas.

Into the closing or capping machine rubber does not enter, but the labeling machine has rubber wipers of the "squeegee" order, by which the gummed tickets are pressed smoothly in place on the bottle.

SEALING PLUG
FOR HOME
BOTTLER.

Rubber aprons and boots are as necessary to the men in the bottling house as the latter are to the cellar or washhouse man.

Reference must also be made to the large quantities of high grade packing required in the brewery. The steam engines, the numerous pumps for moving water, mash, hot or cold beer, for compressing air, etc., and the refrigerating apparatus in all its ramifications, all use packings in both the molded and sheet form and in every instance a high grade article, specially adapted for the purpose for which it is to be employed, is required. Rubber valves for the pumps are also in constant demand.

The electric equipment of a brewery, as to power, lighting, signaling, etc., is much the same as may be found in almost every modern industrial plant and uses similar insulating material, switch bases, etc., except that special care must be taken to counteract the rotting of insulation and short circuiting caused by the ever present and abundant moisture.

One feature of brewery electric lighting is, however, peculiar to these establishments. We referred above to the varnishing of the interior of the big wooden vats and casks with an alcoholic preparation. The atmosphere during this process becomes highly charged with inflammable alcohol fumes. The work is usually done by men wearing a smoke-helmet with the aid of an incandescent lamp, and in order that a careless workman may not break the bulb by allowing it to drop against the side of the tank it is customary to encircle it with heavy rubber rings or bands that act as a buffer. Lack of this simple precaution has on various occasions resulted in the incandescent film in a broken lamp igniting the alcohol fumes, with fatal results to the workmen and serious damage to the plant.

Their resistance to wear and the effects of moisture, make rubber mats and other floor coverings of rubber particularly desirable for brewery offices, while in the more pretentious establishments rubber tiling forms an artistic and lasting floor covering for the well appointed offices.

There is one more field in which rubber finds use in the brewery,

FILTER PRESS FOR BREWERIES. FRAMES AND GRATES OF HARD RUBBER.

and that is in advertising. Enterprising concerns furnish their customers with rubber beer-glass mats bearing appropriate inscriptions. A very handy little tumbler washer, consisting of a stout wooden handle having at one end a rubber jacket with flexible fins or flanges on the bottom and side, a convenient and sanitary device for cleansing tumblers, is distributed to patrons by a well-known brewing company.

While precise figures are unobtainable as to the extent to which rubber tires are used for brewers' automobile trucks, a simple estimate will afford an idea as to the importance of the demand:

The brewery visited by the writer operates twenty-two motor trucks in its distributing department, and last year's bill for tires for these vehicles was \$6,000, or approximately \$270 per annum

for each truck. Another, much larger New York brewery employs many more automobile trucks and bottled beer wagons in the delivery of its product, and the expenditure for tires is approximately \$35,000.

In Greater New York there are between 50 and 60 breweries

KEG SCRUBBING MACHINE.

of all sizes. Assuming that they only used motor trucks for the distribution of their product in the same limited proportion as the brewery above referred to—which is not the case, some using few if any, and some of the big brewers using them exclusively—the expenditure for rubber tires would reach several hundred thousand dollars a year. These figures, however, are only approximate, there being no definite record as to the number of automobile trucks in use on which calculations could be based. That it amounts to a large sum our estimate sufficiently proves.

If we have omitted to mention any important purpose for which rubber is employed in the brewery it is because its uses are so manifold and universal that it is no easy matter in a single recital to refer to them all. Enough has, however, been told to make it evident that the modern brewery as at present equipped, without rubber would be an impossibility and that the brewer is a large and constant buyer of rubber goods.

If the supply of chicle, as we are led to believe, controls the cost of chewing gum, prices for that delectable luxury are likely to be high. For some lots 40 cents per pound has been paid in British Honduras and 26 to 30 cents are the prices quoted for contract chicle, the article as brought in by the gatherers, in square blocks, molded, as a rule, in five-gallon kerosene cans.

Some Interesting Letters From Our Readers.

TOO MUCH ANALYTICAL CHEMISTRY.

TO the Editor of THE INDIA RUBBER WORLD:

There is one point which I think is now worth bringing to the front, namely, that there is every indication that the well as the matter of chemical specifications. Back in the '80s the steel industry went through the same crisis—and came out of it with the conviction that for the user of steel the best course is to make his physical and service tests as severe as he chooses but to leave the method of meeting these requirements to the manufacturer.

You will probably remember that for a few years the Pennsylvania Railroad ordered its steel rails on a chemical formula evolved by the late Dr. Charles B. Dudley after a long and exceedingly able series of investigations.

There is very little left of that sort of thing now in the steel business; but there is altogether too much cropping up in the rubber business. As usual, the Governments and Government chemists are the chief offenders, for they in their contract work necessarily set the pace. This is as it should be, but it would be better if they confined to rigid specifications as to performance and left the means of meeting these specifications to those who presumably understand the matter best. CHEMIST.

[Coming as this does from one of the ablest of American rubber chemists, who from his residence in England has the American trade in good perspective, this suggestion should be very seriously considered.—The Editor.]

DIRECT SHIPMENTS OF RUBBER FROM DUTCH EAST INDIES.

SMALL quantities of the rubber product of the Dutch East Indian plantations are now being forwarded direct from Java to New York, and the writer of the following letter believes that arrangements for such shipments in larger quantities would be advantageous both to the producer and the manufacturer of rubber goods.

To the Editor of THE INDIA RUBBER WORLD:

We have shipped some rubber by steamship, now on the way from Java to New York direct, and will continue to ship every month; the regular service opened by the Dutch Colonial Lines between the colonies and New York enables us to do so. And you may be sure that many rubber producers will avail themselves of that service and that considerable quantities will be shipped monthly.

Under these circumstances the fact that England has prohibited the export from England and its colonies to the United States looks less serious. Our East Indian colonies, which include Java and Sumatra, are becoming large producers of plantation rubber, which will become evident to one who knows that up to June 1, 1914, in all 512,852 acres were planted, of which 312,003 acres with rubber alone, the rest interplanted with catch crops. Although a great many of these estates are controlled by English, and some by French or Belgian owners, the leasehold of every acre belongs to Dutch companies, as none but Dutch individuals or companies can have land rights in our East Indian colonies. Therefore we think the shipments to New York will grow more important the longer the English keep their frontier closed to you.

During the beginning of the war, after rubber had been declared contraband, several Dutch producers shipped rubber to England because they could not get the goods through to Hol-

land (our government has never interfered). But that "Great Britain became the only recipient of the whole of the Middle East supply of plantation rubber," as a certain trade journal puts it, is not a fact. It would be good if you would open the eyes of your readers with respect to this, so that they will know that the statements of this journal are not true.

We wonder why the Americans do not plant more rubber in our colonies, were it only to make themselves more independent in the matter of supplies. In our opinion, no country in the world can compete in rubber planting with Sumatra, where a price of 2s. per pound yields large profits. If you know of people who would be interested in such planting propositions we should be glad to help them to excellent and well situated land. PLANTER.

NEW YORK OR LONDON?

TO the Editor of THE INDIA RUBBER WORLD:

There are a few far-sighted prophets of greatness who affirm that ere long New York will be the center of the world's crude rubber trade; further, that this should be so—that the tax Great Britain forces us to pay for rubber is unnecessary, exorbitant, etc.

We do not agree.

First, as to the likelihood—England owns most of the plantation rubber, hence she is liable to market it at home. She, through her shipping, gathers in the African crop; and it is her boats that carry the Brazilian product. That means handling nearly the whole of the world's product through London if she so elects.

Second, as to the exorbitant tax we pay to England—she paid all of the first cost of experimental planting, and later did the financing of the great Far Eastern plantations. She furnished the men, machinery, transportation and scientific oversight that made *Hevea* planting a success. Why should she not get a good fat profit on her investment? Why should America, who has benefited enormously, even in thought, covet what belongs justly to England? NEW YORK.

BY RUBBER TUBE TO THE BOTTOM OF THE SEA.

Utilizing the waterproof property of rubber, Charles Williamson, of Norfolk, Virginia, has invented a deep sea tube with the aid of which it is possible to reach in comfort a greater depth than is accessible in a diving suit and to remain there for an indefinite period without physical discomfort. The apparatus he has devised for this purpose consists of a flexible tube, made of plates or scales, hinged together and overlapping one another and kept in place by rings or bands of malleable iron that form the skeleton of the structure and prevent its collapse. Over this is stretched a flexible waterproof covering of rubber and fabric, the whole forming a flexible shaft, open at the top and for its entire length and terminating at the bottom in a roomy, circular working or observation chamber. This shaft is provided with windows, from which, with the aid of an electric lamp lowered from above, a good view of the surroundings may be obtained. The occupant of the chamber can render valuable service in submarine operations, by making a careful survey of the bottom, and it can also be used to advantage for locating sponge growths, coral beds, pearl oysters, etc., or even the condition and position of a wreck known to contain valuables. It has been employed effectively in securing pictures of submarine life for moving picture films.

Rubber Essays of Universal Value.

THIS is a collection of twenty-six papers read at the International Rubber Congress, held at Batavia, in October, 1914—a gathering of which the world would have heard much more if it had not been for the mighty conflagration which burst upon Europe just before the time set for the meeting. The papers all deal with problems connected with the production of crude rubber, and to that extent may be said to represent the planter's point of view. They are, however, the work of broad-minded scientists who are concerned with the problem of producing the best article at the lowest cost. Not once is struck the false note of regarding the producer's interest as different from that of the consumer.

One of the most original and interesting of these papers is that of W. J. Gallagher, on "The Significance of Branching in Young *Hevea* Trees." Everybody knows that a tree or plant deprived of its proper amount of light will grow spindling, lifting its head ever higher, while the stalk is thin and weak. In the rubber tree it is evident that a thin stalk means a low bark area and a lessening of the latex producing cells. Mr. Gallagher takes the very practical view that no amount of sunlight is going to do the tree much good unless there are leaves to receive and utilize that light, in turning the crude sap into plant building material. To get a large leaf area there must be branches, and a young tree growing upward without branches is, though growing in the open, much in the same condition as if it were growing in a thicket. This is theory. A test was made in a field containing a number of branched and unbranched trees 2½ years old. The former showed a uniformly better girth. A later measurement showed a growth of girth in the branched trees of 3.2 centimeters, while the unbranched showed a gain of less than one centimeter. Branching having been induced, later, on the unbranched trees, they showed an actually greater rate of growth than the naturally branched trees. Other experiments confirmed the theory and showed among other things that the difference in branches and leaves had more effect on growth than the use or lack of manure.

As to methods of inducing branching, topping will at once suggest itself, but Mr. Gallagher points out that this plan has serious objection. His plan is stripping the young tree of its leaves—not by picking, but by cutting—leaving the petiole attached to the tree. In a few days this drops off and a young branch develops in the leaf scar, the result being a fine, well-balanced head. He does not believe in excessive pruning, but thinks the branches settle the question themselves in the survival of the fittest. He thinks branches should be allowed from 7 feet upward. There is no light gained for the leaves by tilting the crown a few feet. He says if the time comes that the plantation as a whole needs light the remedy is not to cut out branches but trees.

Mr. Gallagher says: "Topping should be done, if done at all, before the trees are two years old. The top should be cut off with a sloping cut, which should be immediately tarred. The cut should be made in the uppermost whorls of leaf traces, and not necessarily at ten feet high, but in the best place nearest to ten feet. Thus A is made at the right place, B is not.

This brings us to the subject of thinning, which is considered in a paper by Mr. E. B. Skinner. In the matter of close planting the experience of the rubber grower is not analogous to that of the northern fruit grower, a fact which had to be learned by hard experience. With the latter the produce of the young trees is as good as the old and the whole field may be swept clear at comparatively low cost. But with rubber, immediate returns are the least and, as the planting is for not less than a lifetime, the future of the big trees is the first consideration. Careful experiment shows conclusively that the yield, pound for pound, is better on widely planted than on closely planted equal areas, and of this, according to Mr. Skinner, at least 10 per cent. more is No. 1 rubber. In addition, he shows, conclusively meeting arguments to the contrary, that the cost of harvesting per acre is less with wide than with close plantings. In the beginning Mr. Skinner would plant about 100 trees per acre, and these he would reduce not by cutting out rows, but by selection for elimination of the least shapely or thrifty, and after bearing has begun, of the least productive trees. Always he would have the end in view that the remaining trees must have all the light and air they need. When the elimination of a tree is decided upon he would have it out and done with. The system of pollarding or cutting away the top and tapping the dying stump, he says, does not pay for the labor and nuisance entailed.

The subject of "Seed Selection" is treated by Dr. P. J. S. Cramer, Chief of the Plant Breeding Station at Buitenzorg. The points he makes are briefly summarized and are as follows: Choose seeds from old trees whose qualities have been tested by long experience. Choose, of course, the best from every point of view, yield, health, size and sturdiness. Do not tap the trees selected as seed bearers; let them put all their energies into giving strength and vitality to the seeds. If possible have one part of the plantation set aside for seed bearing and cut out all inferior trees so that there will be no deterioration by cross fertilization. Use seeds from your own plantation; what you want is not only seeds from trees which produce well, but which will produce well under the peculiar conditions of your plantation. If it is not possible to furnish your own seeds get them from a similarly located plantation and from trees of known history.

Several papers treat of diseases of *Hevea* and the best means of counteracting them, but that of H. Colenbrander is of particular interest in telling how vigorous and courageous treatment saved a plantation of 3-year old trees infected with *Fomes Semitostus*, the white root fungus disease. In this case the usual work of freeing the soil from infection was carried out, but by the time it was done nearly all the trees were infected.

In the drastic treatment which was administered to the most badly infected the trees were actually lifted from the ground, the tap roots, most of the main roots and all the hair roots were removed and the little left thoroughly soaked with disinfectant. The trees were left with so little root support that they had to be propped up to keep them from toppling over. The leaves dropped off, and of course growth ceased while the trees, out of their reserve strength, were developing new leaves, new hair roots and, finally, a new system of main roots. But the check was only temporary, and after 3 months growth was resumed with full vigor. It would make an American orchardist rub his eyes to learn that the cost of all this work was less than 20 cents per tree in American money equivalent.

The tempting subject of catch crops is considered in several papers, and while all seem to wish it were possible to reach a good revenue from the ground on which the young rubber trees are maturing, not one is able to suggest any crop or plan which makes any sure promise of profit.

"Methods of Coagulation and Preparation of Plantation Rubber" is a paper which cannot fail to interest the rubber man in the market place. It is by B. J. Eaton, Government Agricultural Chemist of the Federated Malay States. After stating that the coagulant used on at least 99 per cent. of the estates is acetic acid, he proceeds to lower the colors of those who criticize acetic acid as a "chemical" by informing them that it is acetic acid in the smoke of the Brazilian native gatherer which produces the admirable results in coagulation to which the critics have been pointing. In the use of this acid care must be exercised, like soda in the biscuit, there must be neither too little nor too much. Too concentrated a solution forms clots, too dilute will not work at all. It is possible to use sulphuric acid, but its less cost is not held to warrant the risk its use involves. The latex is coagulated 40 or 50 gallons at a time, and after four hours is removed from the pans. The coagulum is then passed between rollers to expel the greater part of the moisture, placed in racks to drain and the sheets are removed to the drying room the same evening. The smudge is usually made of cocoanut husks with the addition of indifferent woods and continues 10 to 14 days, or slightly longer.

The subject of smoking and its effects are considered in the foregoing paper, and also in one by G. Stafford Whitby. Probably there are very few who do not believe that the dark color of rubber is due to the particles of carbon from the smoke. That this is not true may be seen at once in the fact that the rubber

when it leaves the Amazonian fire is still nearly white and that it darkens afterward. It is now practically certain that the darkening is caused by an oxidizing enzyme present in the latex and its action on certain oxidizable substances naturally present in the latex, but which may be added to by the smoke. The addition of sodium bisulphite to the latex neutralizes this enzyme, with the result of a very pale rubber. Mr. Whitby thinks that smoked rubber is undoubtedly preferable to unsmoked and attributes it in part at least to the warmth of the heavy smoke.

Some of Mr. Whitby's remarks might be summarized by saying

that rubber is rubber. He says that color is no indication of quality; that there is little or no relation between the tensile properties of raw rubber and the same rubber in a vulcanized state; that the defects of appearance arising from various causes and known as oversmoking have nothing to do with quality, and that the same is true of the appearance of small bubbles in the sheet.

"Labor Conditions in Malaya," by Patrick Hadon, will give comfort to many uneasy consciences disturbed by the thought of the low wages paid to the plantation laborers. Mr. Hadon states that the "feeding, clothing and housing of the coolies is, in many instances, far better than that of the poorest classes in Europe"; that they are beginning to invest in gramophones and bicycles, and that the conditions surrounding them are "extraordinarily happy ones compared

with those existing in the countries from which they are imported."

Space forbids that we should notice the other interesting papers before us, but all are of high standard.

OTHER AWARDS AT BATAVIA EXHIBITION.

In recognition of his comprehensive exhibit of samples of wild rubber and rubber substitutes, a diploma of honor was awarded to Henry C. Pearson, editor of this publication.

As already recorded, THE INDIA RUBBER WORLD cup was given by the jury to the Belgian Colonial Ministry for the best exhibit of wild rubber.

For rubber washing, creping and sheeting machinery, the firm of David Bridge

& Co., Limited, Castleton, Manchester, England, received the highest award, a diploma of honor. For a complete experimental vulcanizing installation for testing stations the same company received a similar award.

A diploma was awarded to the firm of Gido Redjo for the excellent collection of rubber samples prepared by Brazilian method.

The work of art donated by His Excellency, the Governor-General of the Netherland Indies, was presented to the East Sumatra Association of Rubber Planters, for its exhibits of dwellings constructed on approved hygienic principles.

VIEW OF OLD BATAVIA.

THE BEAUTIFUL BOTANICAL GARDENS, BUITENZORG, JAVA.

The omission from the list of honors, in connection with the organization of the recent Batavia Rubber Exhibition and Congress, of Mr. J. Liefstinck, secretary of the undertaking and one of the hardest workers for its success, is resented by planters throughout the archipelago, and it is proposed, according to the "Straits Times," to show recognition of his services to the planting community by a suitable presentation.

MANURING EXPERIMENTS WITH HEVEA.

In a report issued by the International Rubber Congress and Exhibition for 1914 at Batavia, Dr. A. J. Ultee presents the following summary of manuring experiments with *Hevea* made in Java:

No manuring experiments have been made yet in which the yield of rubber of manured trees was compared with that of control trees.

The increase in circumference of the stem has always been taken as a measure for the results, so that it is difficult to form a judgment on the advantage of manuring. The experiments in Java, four in all, were, with the exception of a single one, not complete; they did not extend further than the comparison of full manuring or of a single manuring substance with unmanured control trees. For the rest they satisfied the conditions which must be applied to such experiments.

In two cases no effect of the manure was noticed; in the other two an increase in circumference, although not considerable, was distinctly observed.

LIGHT COLORED RUBBER.

In a similar report Dr. Ultee makes the following observations regarding light colored rubber:

Although with a single exception there is no relation between the color and the quality of rubber, the light colored product always fetches a higher price.

The color is a result of an oxidation process which is accelerated by the enzymes present in the latex. By rendering the enzymes inactive or by adding reducing substances this reaction may be prevented, while it will proceed less quickly if the rubber is soon dried.

The enzymes may be rendered inactive by heating the latex or the rubber for 15 minutes to 80 degs. Centigrade (176 degrees Fahrenheit). In Java this process has practically been abandoned and replaced by treating the latex with sodium bisulphite (NaHSO_3).

That this does no harm to the quality of the rubber has been proved pretty certainly by testing the vulcanized product and by viscosity determinations. The only drawback is that rubber treated with bisulphite dries more slowly, so that one has to be careful in its application.

About artificial drying, no new points of view have recently been expressed. Whether the quality of the rubber deteriorates by quick drying has still to be proved.

According to "Der Seifen Fabrikant," the surplus rubber tree seed from the plantations in the East is to be sent to England, where the oil it contains will be extracted by crushing. This oil, of which the seed, according to our German contemporary, contains 42.3 per cent., resembles linseed oil in appearance and odor and like it is a drying oil. Experiments show that it makes an excellent soft soap and for this purpose it is proposed to use it.

The "Tijdschrift voor Nijverheid en Landbouw in Nederlandsch-Indie" has issued a special number devoted to the 1914 Rubber Congress held at Batavia last Fall and covering the events and achievements of the congress day by day. The booklet is neatly gotten up and well written. It gives special attention to the meetings and the addresses of the notable scientists who gathered at Batavia to discuss the latest progress in the rubber world. The addresses dealt with subjects such as diseases of *Hevea*, experiments with fertilizer, reducing the cost of rubber, and other practical and scientific aspects of the industry.

MORE MONOGRAPHS ON RUBBER INDUSTRY.

Two more of the interesting hand books which the "Gummi Zeitung" is publishing on the various aspects of the rubber industry have appeared.

The first is "Hartgummi und Hartgummi-Ersatz," by Ingenieur A. Regler.

Hard rubber in its many forms has played of late a very large part in the world's trade. Of course a great many of the manufacturing processes in the production of hard rubber goods are secret and carefully guarded by their owners. This refers not only to real hard rubber, but possibly even more to substitutes, of which a number have gained international fame. In this hand-book the author gives a short description of the different methods employed in the manufacture of hard rubber substitutes, dividing the treatment into two classes—the dry and the wet method. Substitutes, however, occupy only a small part of the book, the main part being taken up with hard rubber proper. It is, of course, impossible to describe intimately the different chemical and technical processes in the production of hard rubber, and only a short outline is given. The manufacture of hard rubber dust out of old, hard rubber waste is given considerable space. Especially interesting are the articles on the manufacture of hard rubber goods of every description. This book, like the remainder of the series, is noteworthy for the clear presentation of facts and the elimination of unessential matter.

The second booklet is "Die Reparatur von Autopneumatiks," by Paul Scharffenroth.

This eleventh volume aims to serve as a practical guide to auto tire repairers. It should prove especially useful at the present moment in Germany, when private owners of motor cars have to be content with the defective tires allowed them by the military authorities. Quite apart, however, from the necessities of the present moment, auto tire repairing has become a considerable industry during the last few years in Germany, and many workmen have found tire repairing and the erection of little shops for this purpose the stepping stone to independence. According to the author, a repair shop can be started in Germany with a very small initial outlay. A well-equipped shop would require about \$1,500. The hints given and the rules laid down in the volume are of a practical character, and the author does not waste much time with scientific explanations, but confines himself to practical information. Of course, the book does not bring out anything new or startling. All the advice given is along orthodox lines. The advantage to the reader lies in the fact that everything is clearly and plainly presented. There is a chapter on mistakes in repairing. The chapter on hot vulcanization is particularly well illustrated. Other illustrations show the beginner how a cover can easily be turned inside out. One chapter deals with tools and gives advice as to their selection.

THE AMERICAN EXPORT TRADE DIRECTORY.

This book gives a complete list of the export commission houses, foreign buyers, manufacturers' export agents, foreign exchange banks and marine insurance companies in all the principal ports of the United States. It is divided into twelve parts. The first part, which fills 200 pages, is devoted to an alphabetical list of the export commission houses in New York, the branch offices in that city of foreign concerns, and the export houses in Boston, Philadelphia, Baltimore and other ports.

Part 8 gives a complete review of the steamship service from American ports to foreign countries. Part 10 contains a list of the consuls of foreign countries in the United States.

There is a good deal of other information of interest to manufacturers, all classified and indexed for immediate reference.

It is a Fourth Edition, compiled by Olney Hough, and published by The Johnston Export Publishing Co., 17 Battery Place, New York.

Fifteenth Annual National Automobile Show.

THE Fifteenth Annual National Automobile Show, held at the Grand Central Palace, January 2-9, was well attended and the exhibits were unusual both in number and interest. There were shown 528 cars, ranging in price from \$295 to \$6,000—81 different makes of gasoline vehicles and 6 of electrics. There were 13 motorcycle exhibits and 236 of accessories. The aggregate value of the exhibits was estimated at \$3,560,000.

TIRES AND ACCESSORIES

Automobile tires and their accessories, of course, formed the chief item of interest to the rubber trade. The following tire equipment was noted on cars in the exhibits of twelve prominent manufacturers: Fisk, Federal, Firestone, Goodrich, Goodyear, Kelly-Springfield, Pennsylvania and United States. Many of the companies had attractive and instructive displays.

The Braender Rubber & Tire Co., of Rutherford, New Jersey, exhibited its new "Bull Dog" non-skid tire, an illustration of which appeared on page 154 of the December number of this publication.

The Brown Scientific Tube, a tire tube that is self-closing when punctured, was shown by Story & Reed, of New York.

Dayton Airless tires, which are neither solid nor pneumatic,

The Dreadnaught Tire & Rubber Co., of New York, had the largest and most complete exhibit devoted exclusively to tires. This company features the patented Dreadnaught Vacuum Tread non-skid "that has the grip to it." It is made of the best material, double frictioned, and has a heavy pure gum cushion, single cure molded tread. All Dreadnaught tires are guaranteed for 5,000 miles and to be free from defects of material and workmanship, and each tire bears a serial number.

The Essex Rubber Co., of Trenton, New Jersey, had an effective display of its Essex red inner tubes, patches, plasters, reliners, etc.

The Globe never-skid tire and red inner tubes were exhibited by the Globe Rubber Tire Manufacturing Co., of Trenton, New Jersey.

The Gordon tire, manufactured by the Gordon Tire Co., of Canton, Ohio, under the "Tri-Angle" brand and a 4,000-mile guarantee, was shown by the Ireland Rubber Co., of New York.

The Leather Tire Goods Co., of Niagara Falls, New York, showed Woodworth tire treads and "Easyon" tire chains.

The Marathon Tire & Rubber Co., of Cuyahoga Falls, Ohio, exhibited a complete line of tires and inner tubes. The company specializes in hand-made products, tires in all sizes for all styles

THE INDIA RUBBER WORLD 1915

THE 1915 AUTOMOBILE AND RUBBER.

1—Rubber Tires, 2—Rubber Inner Tubes, 3—Rubber Reliners, 4—Rubber Quick Dismountable Flaps, 5—Rubber Spring Bumpers, 6—Rubber Fender, 7—Rubberized Lamp Cover, 8—Rubber Gasket, 9—Rubber Fan Belt, 10—Rubber Radiator Hose, 11—Dynamo Rubber Insulation, 12—Magneto Rubber Insulation, 13—Magneto Hard Rubber Connections, 14—Electric Starter Rubber Insulation, 15—Wind Shield Rubber Channel, 16—Hard Rubber Switch Bases, 17—Hard Rubber Switch Connections, 18—Rubber Pedals, 19—Hard Rubber Steering Wheel, 20—Hard Rubber Control Buttons, 21—Rubber Insulated Control Wires, 22—Rubber Matting, 23—Rubber Door Bumpers, 24—Hard Rubber Door Handles, 25—Rubber Running Board Matting, 26—Hard Rubber Door Handles, 27—Rubber Door Bumpers, 28—Rubber Matting, 29—Rubberized Top, 30—Rubberized Side Curtains, 31—Rubberized Boot, 32—Spare Rubber Tire, 33—Rubberized Tire Cover, 34—Hard Rubber Rear Lamp, 35—Rubberized Lamp Cover, 36—Storage Battery Rubber Insulation, 37—Electric Gear Shift Rubber Insulation, 38—Rubber Blow-Out Patches, 39—Rubber Tire Boot, 40—Rubber Bucket, 41—Rubber Cement, 42—Rubber Tire Tape, 43—Rubber Cementless Patches, 44—Rubber Repair Stock, 45—Rubber Lugs, 46—Rubber Tubing, 47—Rubber Pump Connections, 48—Rubber Packing, 49—Rubber Brake Lining, 50—Tire New, 51—Rubber Valve Bases.

and which carry a guarantee of 8,000 miles on light cars and 5,000 miles on heavy cars, were exhibited by the Dayton Rubber Manufacturing Co., of Dayton, Ohio.

The Double Fabric Tire Co., of Auburn, Indiana, showed their "Double Rubber" inner tube, made of multiple plies of alternate red and gray rubber. They also exhibited the "Interlock" inner tube, Gray inner tubes, Red liners, "Jumbo" and "Adjustable Look On" outer boots. They claim to be the largest concern in the world devoted exclusively to the manufacture of tire reinforcements and tubes.

of rims, in angle and smooth treads. Its inner tubes are made in six and nine plies, by which possible flaws are corrected.

A tire of novel tread construction which includes a dual cushion tread, triple arch tread, staggered tread and the vacuum cup idea, was the "Mussinan" exhibited by the Mussinan Tire Co., of New York. The object of this construction is to minimize skidding, punctures and blow outs.

The Rubber Tire Accessories Co., of New York, distributors of Dixie tires, made by the Dixie Tire & Rubber Co., of New York, and also of "Pyramid," "Red Wing," "Silver Grey" and

"Isbest" inner tubes, made by the Greensburg Tire & Rubber Co., of Greensburg, Pennsylvania, had an exhibit of the output of these concerns.

An attractive and enterprising display was that of the Rutherford Rubber Co., of Rutherford, New Jersey. Here could be seen the actual building up of a tire casing by an expert tire maker. Frictioned fabric cut on the bias to length was applied to a core mounted on the usual tire jack. The beads were applied in the usual manner, followed by the breaker strip and the tread, affording the layman an excellent object lesson in tire building.

It goes without saying that no automobilist can afford to be without an inner tube repair kit. The Samson Repair Plug Kit centers about strong metal discs covered with rubber. One is placed on the inside and the other on the outside of the puncture and they are screwed tightly together, making a complete repair. Exhibited by Stevens & Co., New York.

The Standard Woven Fabric Co., of Framingham, Massachusetts, showed a well-made rubber fan belt, rubber lined fire hose and a new brand of tire tape.

An interesting tire consisting of an outer casing and an inner tube, the whole called the Steel Pneumatic Tire, was exhibited. It is guaranteed against punctures, blow outs, rim cuts, etc. The casing is similar to the usual type except that the beads are omitted and the thickness of the tread materially increased. The tube is made up of a number of sections, each containing a steel cylinder in which a fixed air pressure is automatically maintained by the movement of the wheel on the road. There is a piston to each cylinder which inflates the tire automatically. Shown by the Steel Pneumatic Tube & Tire Co., of New York.

Chas. O. Tingley & Co., of Rahway, New Jersey, exhibited a complete line of automobile and cycle sundries. Under their brand C. O. T. are hook-on and laced boots, the regular inside patch and a special one for Ford cars. There were also patches that sick and cementless patches in red and gray, rubber-rimmed goggles, gas tubing, lamp connectors and cement in tubes.

The Vail Rubber Co., of Chicago, showed general motor tire accessories, as, for example, Dyke's Ever-Stick Reliners—a complete inside reinforcement made of five-ply fabric vulcanized together on the bias; the molded reliner made of four-ply fabric; Dyke's Never Creep Double Lock and Lace-On outer boots, etc.

At the booth of the Voorhees Rubber Manufacturing Co., of Jersey City, New Jersey, was a complete line of auto accessories and repair stock. Their "Ideal" red tube is made by a special process, and each tube is packed in a strong duck bag to prevent chafing and damage.

The K. C. "No-Stretch" boot is a steel studded leather and rubber accessory that is guaranteed for 2,000 miles. By combining rubberized tire fabric, stretched by a special process, with prepared leather, water resisting and wearing qualities are obtained. It is quickly applied by hooks which fit under the clinching ring. Shown by The Western Tire & Rubber Co., Kansas City, Missouri.

A. W. Rossen & Co., New York, exhibited Woodworth studded treads, intended to prevent punctures and protect tires from road wear and skidding. These are easily applied and prolong the life of the tire. The Woodworth ventilated rubber tread is a steel studded tread that has an annular protecting strip made of rubber reinforced with fabric, to prevent punctures. All these leather tread specialties are reinforced on the inside with strong waterproof fabric.

AUTO TOP FABRICS.

Top fabrics in increasing quantities are being produced to meet the rapidly developing demand, and several displays were made by manufacturers of this waterproof material. A very comprehensive exhibit of mackintoshes, cloths, auto leathers or rubber cloths was that of the L. J. Mutty Co., of Boston. Their "Numotor" cloth, which is new, is made in single and double texture to match the auto top. All of these double tex-

ture fabrics are interlined with one of three grades of rubber coating, "Bulldog," "Superior" and "Standard." The Bulldog in particular is guaranteed absolutely waterproof and non-separable. The standard is for curtains, seat covers, etc.

An exhibit of material for automobile top coverings, guaranteed absolutely waterproof without time limit in any climate and under all circumstances, was that of the F. S. Carr Co., of Boston, manufacturers of the "Neverleak" top covering.

The Laidlaw line of automobile fabrics shown by Laidlaw Co., Inc., New York, embraces a complete assortment of patterns and textures. The Laidlaw "Storm King" top covering is a rubber surfaced, rubber interlined top cloth made in bright or dull finish, long straight grain or pebble grain.

AUTOMOBILE ACCESSORIES.

Pedal pads for all makes of cars were shown by the Auto Pedal Pad Co., of New York, their "Perfection" pads being especially in evidence.

The Gabriel Wind Shield Cleaner is a rubber squeegee arranged on the wind shield. The pull of a string removes any moisture collected on the glass. It is made by the Gabriel Horn Manufacturing Co., Cleveland, Ohio.

Another novelty is the "J. H." tonneau or rear seat shield. It is made of glass and rubberized fabric. It is adjustable and can be folded, occupying little space when not in use. It is manufactured solely by Mutual Auto Accessories Co. of America, New York.

Herz's Tape Grip Ring is not rubber, but is associated with it. The ring and a short length of tape make a practical connection between rubber hose and metal pipe. It is simple and easily attached or disconnected. Herz & Co., New York.

Charles E. Miller, of New York, exhibited the well known line of specialties and auto accessories manufactured by this enterprising firm.

A very practical auto bucket made of the finest quality of maroon rubber, cloth lined—the product of Whitall Tatum Co., New York—attracted much interest.

A great variety of molded articles in either black or brown, highly polished or dull finish, used in electric insulation and apparatus was shown by the Essex Rubber Co., of Trenton, New Jersey. Automobile radiator filler caps, switch buttons, handles and bases, steering wheels, handles for cutlery and many other articles made of Condensite were also shown.

MISCELLANEOUS.

There were many novelties shown not made of rubber, and some which depend for their usefulness on hose, tubing or a rubber gasket.

Among the exhibits of manufacturers closely associated with the rubber trade, but not engaged in the production of rubber goods, one of the most notable was that made by the Cutler-Hammer Clutch Co., of Milwaukee, manufacturers of the magnetic clutch and brake used in most of the large rubber mills.

Another was the Westinghouse exhibit where there was an electric device for nearly every need. For the automobile and garage there were battery charging outfits, tire vulcanizers, small motors for driving tools, starting, lighting and ignition systems.

Several of the vulcanizer companies displayed their wares, including Henry Adams & Co., of Chicago; the Marvel Auto Supply Co., of Cleveland, Ohio, who showed two models, A and C, intended respectively for small repair and for repairs on large tire casings; the Positive Tire Vulcanizing Co., of Davenport, Iowa, who exhibited two portable vulcanizers, one for repairing inner tubes and the other for mending surface injuries to casings, etc.; the C. A. Shaler Co., of Waupun, Wisconsin, whose exhibit included the well known Vul-Kit vulcanizer and also the Tube-Kit, Cycle-Kit and Ford-Kit.

The Autoped Co. of America, New York, covers the field of the bicycle, motorcycle and the horse vehicle combined. It is

portable, motor driven and has two wheels, with carrying platform below the axles. The passenger balances himself on this platform by means of the steering bar and handles, in which are the controls of the self-contained motor mounted on the front wheel.

The Newmastic Co., of New York, had tire filler on view.

A number of the rim manufacturers showed their line—the Ashley Wire Wheel & Rim Co., the General Rim Co., of New York, and the Standard Welding Co., of Cleveland, Ohio.

F. Edlmann & Co., of Chicago, showed tire gages.

A. Schrader's Son, Inc., of Brooklyn, showed the full line of valves, tire pressure gages, etc., manufactured and sold under their well and favorably known brand.

The Cleveland Worm & Gear Co., of Cleveland, displayed a new tire instrument for removing and replacing clincher tires.

THE AUTOMOBILE SALON FOR 1915.

THE Automobile Importers' Alliance, Inc., held an Automobile Salon in the ballroom of the Hotel Astor, January 29, where many of the foreign cars were exhibited.

The Canadian Dunlop tires shown at this exhibition were the Traction Tread, a real anti-skid tire, the Cross-Groove tread for all-year-round use, and the Dunlop "All-Red" inner tube. The virtues of these tires are set forth in claims for perfect traction, minimum punctures, more resiliency and anti-skidding.

Another tire of novel tread design is the Faure never-skid. These are made with reinforced casings and are furnished in over-size and double-over-size interchangeable sizes.

The Hardman Tire & Rubber Co., of Belleville, New Jersey, exhibited their single cure wrapped tread tire with the sure grip tread. The manufacturers lay special stress upon the process by which the tire is manufactured—the best of material and the final cure.

While Michelin tires were in evidence in the equipment of several of the exhibits, there was no special display of this well known product. The anti-skid leather tread tire with steel studs is a well made and practical looking tire. There were also cars equipped with Firestone, Goodrich, Silvertown Cord and other standard makes of American tires.

PROCEEDINGS OF THE SOCIETY OF AUTOMOBILE ENGINEERS.

IN connection with the annual meeting of the Society of Automobile Engineers, held in New York, January 6-7, the standards committee of that organization at its meeting considered and approved the reports of 14 different committees bearing on the question of standardizing different automobile parts, including some of notable interest to manufacturers of rubber tires.

Among these reports was one on a new schedule of tire and rim sizes, presented by the pleasure car and commercial car divisions of the standards committee. This schedule, the result of prolonged labor, will specially interest tire makers because of its simplification of their business. In place of the almost endless range of tire sizes, manufacturers are now called upon to produce and stock, the following schedule of nine sizes, adapted for rims of 30 x 3 to 38 x 5½ inches, inclusive, had been prepared by the divisions, together with a list of nine odd or oversize tires, intended for use only by consumers who are desirous of increasing the tire capacity of their cars beyond that intended by the builder. The new schedule, which was included in the report of the pleasure car's division read by Mr. E. R. Hall, of the Goodyear Tire & Rubber Co., was adopted without discussion by the general meeting and has been endorsed by the Clincher Automobile

Tire Manufacturers' Association. With its nine sizes each, of tires and rims, it is designed to take the place of a list of more than 50 sizes of tires.

Rim sizes.	Even tire sizes for manufacturers and consumers.	Odd or oversize tires (for consumers only).
30 x 3	30 x 3	31 x 3½
30 x 3½	30 x 3½	31 x 4
32 x 3½	32 x 3½	33 x 4
32 x 4	32 x 4	33 x 4½
34 x 4	34 x 4	35 x 4½
34 x 4½	34 x 4½	35 x 5
36 x 4½	36 x 4½	37 x 5
36 x 5	36 x 5	37 x 5½
38 x 5½	38 x 5½	39 x 6

A new 36 x 5-inch rim, not previously recommended, identical with the present 4½-inch or F section rim, is included in the schedule, its width, between flanges, being halfway between the present 4½-inch or F section and the 5½-inch or G section rims. Its tire seat diameter will be the same as the present 36 x 5 (26 inches) and the rim will receive any 36 x 5 tire at present on the market or manufactured. The oversize, 37 x 5½ tire, can be used with this rim much better than with the old 36 x 5 narrow width rim.

A paper on "The Pros and Cons of Tire Inflation," prepared by Charles B. Whittelsey, secretary and factory manager of the Hartford Rubber Works Co., conveyed some important information on the functions of the pneumatic tire, showing how its efficiency as a shock-absorber was dependent wholly on its proper capacity and inflation, i. e., its interposition of a large enough and sufficiently resilient air cushion between the vehicle and the roadway. As promoting this condition the author favors the oversize tire.

The importance of proper inflation is referred to also from the standpoint of tire durability, a tire inflated to the right degree being not only less liable to punctures, blowouts and other tire troubles, but also protected against the excessive wear due to undue flexing, 12 or 14 per cent. of its sectional diameter being quoted as the maximum extent to which a tire should flatten at the point of contact, to give good service. There is, moreover, less heat developed in a tire of the right size and inflation, an important factor in its longevity. Tables showing the extent to which tires of various diameters should be inflated and the size of tire to be used for different loads, add to the practical value of this paper.

Another paper in which the manufacturer of rubber tires will be interested is by R. B. Mudge and deals with the object of "Wood Wheels vs. Wire Wheels." As a result of various tests made, the writer claims that the wood wheel, on account of greater resiliency, is more conducive to tire durability than the wire wheel. On the other hand, a paper entitled "Wire Wheels or Wood Wheels," treating in detail with the results of tests made with the two styles of wheels, by George W. Houk, is offered by the author as justifying a claim of 30 per cent. gain in service in favor of the wire wheel.

As the nature of the papers and reports above referred to will sufficiently show, the proceedings of the meeting were of a character to interest alike the automobile owner and consumer of rubber tires, their manufacturer and the student of automobile technology.

As a result of the general use of motor vehicles for transportation purposes in the war and the difficulty of keeping them shod with rubber tires, the spring wheel is finding extensive use. It is reported that one order from the German government called for more than 5,000 sets of heavy type spring wheels. Should the spring wheel make good, it will mean good news to the inventors and patentees of innumerable devices of this character.

What the Rubber Chemists Are Doing.

BULLETIN No. 96 of the United States Hygienic Laboratory contains accounts of a number of analyses of rubber goods made to determine whether there were any substances present of a nature injurious to persons coming in contact with them. Nursing nipples were particularly examined. The report says: "Bearing in mind the conditions of the infant's mouth, it is undesirable that antimony be present. Lead, arsenic and mercury should be absent. Magnesium zinc and clay are less undesirable, and barytes are probably harmless." Antimony and Venetian red were noted, in addition to zinc oxide. No lead, arsenic or mercury were found. Generally speaking, the samples were found to be quite harmless.

DETERMINING THE CHEMICAL COMPOSITION OF CAOUTCHOUC.

C. Harries, of the University of Kiel, and Otto Lichtenberg, working quite independently, have been studying this question by producing halides with hydrochloric acid and regenerating the rubber by use of pyridine, then forming the ozonides. Various other compounds have been produced. Harries concludes from this and previous work (see "Berichte," Vol. 46, pages 733 and 2590; "Chemical Abstracts," 1914, page 260; "Journal of the Society of Chemical Industry," 1913, page 983; "Annalen," Vol. 406, 1914, page 173, and 1913, page 395; "Gummi-Zeitung," November, 1913, page 168; "Journal of the Society of Chemical Industry," 1913, pages 203 and 264; also "Chemical Abstracts" of 1913, pages 346, 1502, 1986 and 2860) that the theory of the 8 carbon ring must be abandoned and that raw rubber is not 1.5 di-methyl cyclo-octadiene, but that the molecule must be much larger, with at least 20 carbon atoms.

Lichtenstein seems to get about the same results ("Chemischer Zeitung," 1914, page 124). The work of both these authors is abstracted in "Chemical Abstracts," January 20, 1915, as is that of Caspari on osmosis, referred to in THE INDIA RUBBER WORLD, October, 1914, page 17. An abstract of an article on vulcanizing rubber shoes, from the "Gummi Zeitung," will be found in the same volume, and also a description of a friction testing machine by J. M. Bieber.

R. B. Rice has obtained Canadian patent No. 158,899 for vulcanizing under pressure. Later we refer to other patents along this line.

In the "Journal of the American Chemical Society" for December, 1914, page 2468, there is a record of studies by G. N. Lewis and M. Randal on "The Free Energy of the Various Forms of Sulphur." The article begins with the statement that "no other element is known to occur in so many forms as sulphur."

This seems to be largely made up of calculations based on the experiments of others, who are quoted. It will be of interest to those who are studying the functions of sulphur in vulcanization.

The January issue of the "Journal of Industrial and Engineering Chemistry" contains, on page 21, an article by Morris Weiss, of the Barrett laboratories, on "The Determination of Specific Gravities of Tars, Oils and Pitches." On page 34 is an article describing a method of determining the unsaponifiable matter in ether extracts. This was developed by the Texas experimental station.

SOME NEW PATENTS RELATING TO RUBBER.

David Spence, of Akron, Ohio, who assigns to The B. F. Goodrich Co., has received United States patent No. 1,122,653 for dyeing rubber. The claim is for "treating rubber with an aromatic amin in aqueous solution, then subjecting to a dye-forming bath." That is, the raw rubber is treated with aniline oil till some of the oil has been absorbed; then, by use of nitrites, the aniline is fixed on the fibre, and when treated with betanaphthol-sodium salt, for example, will develop a blood-red

color. Recently (THE INDIA RUBBER WORLD, November, 1914, page 67, and December, 1914, page 130) comprehensive patents for the use of coal tar dyes have been granted Beyer & Co.

Lewis Carter Warner, who assigns to the Beacon Falls Rubber Shoe Co., of Beacon Falls, Connecticut, has received United States patent No. 1,122,824, which claims the vulcanization of rubber shoes by subjecting them first to a vacuum, then to pressure, and afterwards vulcanizing. Quite recently (THE INDIA RUBBER WORLD, November, 1914, page 95) a patent was issued which comprised a system of vulcanizing under vacuum.

Herbert W. Kugler, of Akron, Ohio, who assigns to the Firestone Tire & Rubber Co., has obtained United States patent No. 1,124,920 for a process of reclaiming rubber, which consists in heating under pressure with alkali and aniline (THE INDIA RUBBER WORLD, October, 1913, page 37, and August, 1914, page 622).

Leo Dart, who assigns to the Electro-Chemical Rubber & Manufacturing Co., has obtained United States patent No. 1,120,795 for rubber-coated articles and method of producing the same. The essence of the invention seems to be in putting bismuth or its alloys on the surface of the metal, which allows the rubber to be vulcanized thereon. In United States patent No. 1,120,794 the same inventor makes the above claims for antimony.

Otto Rohm, of Darmstadt, has obtained United States patent No. 1,121,134 for process of making rubber substitute, which consists in vulcanizing any acrylic acid ester.

ANALYSIS OF RUBBER.

In the November, 1914, issue of the "Chemical Engineer," the methods used by the Armour Institute of Technology for the analysis of rubber are detailed in full.

The analysis of raw rubber is first taken up and the sampling methods used are described. While it is recommended that large samples be made by mixing a great number of small samples taken from various parts of the whole lot, no definite process of procedure is outlined.

Moisture: The rubber is dried in a vacuum desiccator over sulphuric acid, with weighings extending over several days, but it is recommended that for technical work, drying in a stream of gas be used, notwithstanding that gas is absorbed by the rubber to some extent. It is maintained that concordant results are what is required rather than absolute exactness.

Estimation of Resins: This is made by acetone extraction in a modified Wiley-Soxhlet apparatus, first wrapping the samples in cheese-cloth in which it is afterwards weighed after five hours' drying at 90 degrees C. in hydrogen. The extract, after driving off acetone, is saponified. The unsaponifiable matter is extracted in a separatory funnel with ether. The ether extract of unsaponifiable matter is dried and taken up in alcohol, and the waxy hydrocarbons are frozen out with ice and salt. They are dissolved in chloroform, dried and weighed. This is called the resins.

Determination of Insoluble Matter: A sample of one-half gram to one gram is weighed and dissolved in a graduated cylinder with benzol in about two days. The solution is made up to 200 C. C., and after settling, an aliquot part of solution is taken off, evaporated to dryness and weighed. The difference between this weight and the same proportion of the original sample represents the same proportion of insoluble matter which is thus calculated and determined.

Nitrogen: This is determined by the ordinary Kjeldahl method.

Estimation of Ash: Gentle incineration in a muffle is used, the residue being weighed. By examining the ash some conclusions can be drawn as to the origin of the rubber.

ANALYSIS OF MECHANICAL RUBBER GOODS AND RUBBER INSULATION.

Ash: After an acetone extraction the residue is gently ignited and weighed, making no corrections for the sulphur. This is much simpler than the method recommended by the Joint Rubber Insulation Committee ("Journal of Industrial and Engineering Chemistry," January, 1914, page 74). They dissolve the residue in Terebene and xylol and filter through tared filter paper which is then weighed without incineration.

Total Sulphur: The sample is treated with nitric acid saturated with bromine and evaporated to dryness and fused with potassium nitrate and sodium carbonate. The sulphate thus formed is determined as usual.

Acetone Extraction: This is performed in a modified Wiley-Soxhlet extractor with a sample wrapped in extracted and weighed cheese-cloth, as before described. The residue in the

cheese-cloth is dried in a hydrogen gas current for five hours, and the loss of weight is called "acetone extract uncorrected." Saponification and freezing are performed as in crude rubber determination above. The product is called "waxy hydrocarbons." It is evident that any rubber resins present would thus be called "waxy hydrocarbons." Sulphur is determined in the saponified matter as sulphate. The above method is practically identical with that recommended by the Joint Rubber Insulation Committee referred to above. But the committee makes a further separation into cases "A" and "B."

Rubber: The sum of the corrected acetone extract, ash, total sulphur and waxy hydrocarbons, is subtracted from 100, and the difference is called "Rubber by Difference."

A comparison of these methods with those recommended by the United States Bureau of Standards may be made by referring to THE INDIA RUBBER WORLD, December, 1914, page 129.

A Review of Recent Progress in Rubber Chemistry— I.

Contributed.

The author of this paper, a well known rubber chemist, submitted it, not as in any way a descriptive article, but merely as an index of progress during the last two years. To elaborate it and make it a readable article would necessitate the use of many hundreds of pages.

DURING the last few years there has been considerable progress in the chemistry of rubber, though there have been no striking discoveries which have greatly changed rubber manufacture or been of marked commercial importance. Perhaps one reason for this has been the fluctuation of price in rubber itself and the commercial changes attributable to the rapid advance in the use of plantation brands, together with the lowering of price and disappearance of many brands of rubber.

As an instance of this may be cited the immense amount of work and money spent on synthetic rubber research while the price of Para was around \$2 per pound. Another instance is the partial disappearance of the deresinating industry, owing to the increased price of crude pontianak and scarcity of other brands of low grade crude.

The notable book by C. O. Weber, published in 1902, gave English readers the first classified work on the theory and practice of rubber chemistry, though much had been published before in a desultory way. Since that time general chemistry has advanced. Colloid chemistry particularly has received much attention, and, as rubber is one of the best examples of a colloid, this advance has helped rubber chemistry.

COLLOID CHEMISTRY.

Since the publication of the work entitled "Colloids and the Ultra-microscope," by R. Zsigmondy, and translated into English by Jerome Alexander, this subject has received much attention, especially as the invention of the ultra-microscope has enabled us to actually see the colloid groups. One of the latest contributions on this subject from an American authority, Dr. Wilder T. Bancroft, is a paper prepared for the meeting of the American Chemical Society which was to have taken place in Montreal in August. In this he gives a working theory for colloid chemistry which may be summarized as follows:

1. Colloid chemistry differs from ordinary chemistry only through the variation resulting from the increasing dispersity of one or more phases.

2. Selective absorption occurs at the surfaces.

3. Sufficiently finely divided particles which are prevented from coalescing will be kept suspended by the Brownian movement.

4. Under fixed conditions of peptonization, we get an approximately definite limiting concentration corresponding with a saturated solution in the case of a true solution. ("Journal of Physical Chemistry," 1914, Vol. 18, p. 549.)

P. Bary ("Journal of Physical Chemistry," Vol. 10, p. 437) states there are two strict divisions of colloids: Those having the power to form gels on account of their great cohesion and power to dissolve. These are properly so called. Second, electrical suspensions. In the case of gels, the conversion into miscellæ is obtained at a specific increase in volume, independent of the nature of the solvent, which may be benzol, chloroform, etc.

In another article this author (*Ibid.*, No. 3) states, "benzene penetrates slowly, passing by osmosis into the particles."

OSMOSIS AND SWELLING IN SOLVENTS.

Some recent work has been done along this line. W. A. Caspari read a paper before the London Chemical Society in which the osmotic properties and physical constants of rubber solutions are described. (THE INDIA RUBBER WORLD, October, 1914, p. 17.)

F. Kirchof (THE INDIA RUBBER WORLD, October, 1914, p. 17) has made a thorough investigation on the swelling of vulcanized rubber.

VISCOSITY.

At the Eighth International Congress of Chemistry, J. G. Fol, of Delft, presented a paper on the relation of viscosity to the amount of resins in Castilloa rubber (Vol. 9, Report of the Eighth Congress). This paper was discussed there (*Ibid.*, Vol. 27) by E. Marckwald, F. H. Hinrichsen, Eaton and others. Clayton Beadle and Stevens later discussed this subject. (THE INDIA RUBBER WORLD, October, 1914, p. 18.) P. Schidrowitz ("Chemical Abstracts," Vol. 13, p. 3669) has further contributed to our knowledge of this subject. R. Gaunt (THE INDIA RUBBER WORLD, August, 1914, p. 600) has also taken up the subject of the viscosity of solutions. F. Kirchof ("Kolloid Zeitung," 1914, Vol. 15, p. 30) has made a study of the influence of the solvent on the viscosity of rubber solutions.

In general the viscosity coefficients, it is found, run parallel with the numbers which form a measure of the swelling capacity of the various solvents toward caoutchouc. Solutions in haloid compounds, such as carbon tetra-chloride, tetra and penta-chlor-ethane, have twice the viscosity of benzol or petroleum benzene solutions. Spence and Kratz (THE INDIA RUBBER WORLD) have also contributed to this subject. B. J. Eaton ("India Rubber Journal," August 16, 1913) has made some investigations on viscosity. It may be noted that most of the workers

on rubber solutions prefer to use the Ostwald viscosimeter, which is so little known in America that the dealers in laboratory supplies neither illustrate nor catalog it.

CONSTITUTION OF THE RUBBER MOLECULE.

F. E. Barrows ("Armour Engineer," March, 1913, p. 169) has a thesis on the theoretical structure of the rubber molecule. This article has attracted much attention in Europe. Ditmar ("Kolloid Zeitung," July, 1913) gives four pages to a review of this article.

Hilden had very early shown that isoprene was methyl divinyl, as quoted by Weber, but several years ago Harris ("Berichte," Vol. 38, pp. 1195 and 2590), after a thorough investigation, concluded that the rubber molecule was 1,5, di-methyl-cyclo-octadien, 1,5, which may be regarded as two molecules of isoprene united by their double bonds, forming the 8 carbon ring. In the "Annales de Chimie," 1913, p. 395, and "Berichte," Vol. 40, p. 733, work is described on the halides and hydro-halogenides and ozonides, from which conclusions are drawn as to the above 8 carbon ring and the differences in construction between the artificial rubbers and the natural rubbers. ("Journal of the Society of Chemical Industry," 1913, pp. 203, 264, 372 and 983; and "Chemical Abstracts," p. 2862.)

W. Caspari (THE INDIA RUBBER WORLD, April, 1914) has written on the composite nature of crude rubber. Quite recently ("Annales de Chimie," Vol. 406, 1914, p. 173; "Chemiker Zeitung," No. 21, p. 1239, and "Gummi Zeitung," November 3, 1914, p. 168), Harries has contributed articles on the constitution of caoutchouc and allied compounds. Lichtenberg ("Gummi Zeitung," November 13, 1914, p. 168) has studied the conversion products of the hydro-halogenides of caoutchouc and their thermal dissociation.

THE NATURALLY ACCOMPANYING SUBSTANCES IN CAOUTCHOUC.

When Weber wrote his work it was recognized that resins, ash and nitrogenous matters always accompanied rubber and the influence of the resins was recognized, but the idea that the insoluble portion described was of any influence was scouted on account of its small quantity.

At the Eighth International Congress of Chemistry L. E. Weber read a paper showing that the extraction of resins greatly interfered with the vulcanization of rubber. (Vol. 9, p. 95, Report of the Eighth Congress.) Clayton Beadle and H. P. Stevens discussed this (*Ibid.*, Vol. 25, p. 581) and confirmed Weber's statements. G. H. Savage also commented on this subject (*Ibid.*, Vol. 27, p. 71) and discussed the effect of litharge.

THE INSOLUBLE CONSTITUENTS OF CAOUTCHOUC.

Since the time above referred to the nature of the insoluble constituent has been studied and its influence determined with some degree of accuracy. Beadle and Stevens (THE INDIA RUBBER WORLD, May, 1914, p. 400) have shown its influence. In the "Journal of the Society of Chemical Engineers," December 16, 1913, there is a full account of their experiments. W. Caspari, as cited above (THE INDIA RUBBER WORLD, April, 1914, p. 340), has shown that the pectous portions are stronger than the non-pectous portion. Newton W. Barritt, of the International Institute of Agriculture at Rome, has lately (THE INDIA RUBBER WORLD, June, 1914, p. 507) discussed the proteins of rubber.

Spence and Kratz have in connection with studies on viscosity (THE INDIA RUBBER WORLD, October, 1914, p. 18) isolated the insoluble constituents and determined the amount of nitrogen therein and described the isolation and characterization of the soluble constituents. G. Bernstein (THE INDIA RUBBER WORLD, November, 1914, p. 68) criticizes their work, claiming it is not novel in methods used. Marguis and Heim (THE INDIA RUBBER WORLD, November, 1914, p. 68) in the "Bulletin of the Society of Chemistry," 1913, p. 862, have also worked on this problem. W. Schmidt has also contributed to this subject. ("Journal of the Society of Chemical Industry," 1913, p. 499.)

RESINS.

Some years ago the deresination of rubbers such as pontianak and guayule was carried on in the United States to a considerable extent and the resins from them attracted quite a little attention as possible substances for use in various arts (THE INDIA RUBBER WORLD, May, 1909, p. 277). At that time little was known as to the chemical composition of these resins, though they had been experimented on considerably for industrial use. We referred above to the part these resins were supposed to play in vulcanizing. Since that time views have changed in many cases. Of late several researches have been conducted upon these resins to determine their chemical composition.

M. Klassert ("Zeitschrift Analytischer Chemie," Vol. 26, p. 471) has conducted quite an extensive research on samples of resins from America, and while he does not seem to know where they came from it is evident from the description that they were extracted resins from pontianak and guayule. The pontianak resins were both the granular kind, as extracted, and the same resins fused.

G. Hillen ("Archives de Pharmacie," 1913, p. 94) gives results of a fairly thorough analysis of pontianak and other resins. The subject of the relation of resins to vulcanization was discussed at the Eighth International Congress of Chemistry by L. E. Weber, Beadle and Stevens (Vol. 9, p. 71, Report of the Eighth Congress), J. G. Fol also gave the results of experiments to determine the relation between the amount of resins and viscosity. E. Marckwald (*Ibid.*, Vol. 28, p. 69) stated that according to his experiments there was no relation between the viscosity and the amount of resins in Manihot rubber. F. W. Hinrichsen also took part in the discussion, and G. H. Savage (*Ibid.*, p. 71) gave results of vulcanizing with resins and litharge.

LATEX AND COAGULATION.

When the main portion of rubber used in commerce and manufactures was produced from wild trees and vines the subject of coagulation of the latex or anything connected with the latex received very little attention from chemists. The production of the rubbers was usually so far from civilization and the transportation and preservation of latex to a point where the chemist could be reached was so difficult that little progress in its study was made. At the Eighth International Congress of Chemistry (Report, Vol. 9, p. 39) Clayton Beadle and H. P. Stevens made a long report on work on latex which had been preserved and sent to England. They concluded that latex preserved with ammonia would, after dialysis, behave similarly to fresh latex. Coagulation, they believed, whether partial or complete, is brought about by the action of acid-reacting substances on the free globules only. They state that 0.15 per cent. acetic acid will completely coagulate freshly dialyzed latex.

In part 2 of their paper they give complete analyses of latex.

COAGULATION.

The Para rubber gatherers developed without the help of chemists a very good system of coagulating latex, and rendering it antiseptic, merely by their crude smoking methods. The modern chemist has succeeded in pointing out to the plantation manager how he can get the same effect with practically the same substances applied by more modern methods. Modern coagulation by acetic acid is following the same lines as the *seringueiro* with his smoke. The acetic acid used by the plantation manager is made primarily from wood smoke. In addition, it is becoming common to produce smoked sheet.

Sidney Morgan (THE INDIA RUBBER WORLD, December, 1913, p. 147) with Clayton Beadle and Stevens have given results of many experiments in methods of coagulating and drying crêpe and their effects on the product. They found that in all cases the use of sodium bi-sulphite improved the rubber and made pale crêpe.

M. V. Cayla (THE INDIA RUBBER WORLD, December, 1913, p. 118) has recently given a long description of the Brazilian system of smoking to produce coagulation.

Newton W. Barritt, in the "Journal of the Society of

Chemical Industry," 1914, p. 289, and THE INDIA RUBBER WORLD, August, 1914, p. 600, have very thoroughly treated this subject. They conclude that acid and salts are both necessary, but there are some salts in the latex.

M. Vernet (THE INDIA RUBBER WORLD, October, 1913, p. 14) in discussing this subject says there are difficulties in using both acids and salts for coagulation, but advises their use. B. J. Eaton says that 0.1 gr. of acetic acid to 100 C.C. of latex is sufficient ("Journal of Society of Chemical Industry," 1913, p. 1097). A. E. Berry has received British patent No. 16,728, of 1913, for coagulating latex with one-tenth per cent. of 5 per cent. solution of sulphurous acid. S. C. Davidson has received British patents No. 13,438 and No. 20,183 of 1913, and No. 764 of 1914 for coagulating by the use of creosote (THE INDIA RUBBER WORLD, December, 1914). Byrne has applied to the German patent office for patent on using wood vinegar for this purpose.

Schidrowitz and Goldberg ("India Rubber Journal," Vol. 44, p. 1147) after experimenting very thoroughly find that the less acid used in coagulating the better the quality of the rubber. F. Kaye has shown ("India Rubber Journal," 1913, p. 1297) that the acid combines with proteins in vulcanization.

The Rubber Planters' Association ("Planters' Chronicle," August 25, p. 628) has recently had extensive experiments made on the production of acetic acid for coagulating and investigated other substances. It is claimed that the slightest trace of copper in the acid is fatal to coagulation work, as it produces a slimy coagulation and a worthless product, and great care is exercised to obtain acid free of copper. Toddy vinegar, bi-sulphate (not sulphite) of soda, formic and lactic acid are recommended, and if unobtainable, sulphuric acid is allowable. Alum is said to be much used by the natives for coagulating. Eichelbaum received German patent No. 256,904 and addition No. 254,196 for preserving latex with sulphy-silicate compounds and formaldehyde and later for using hydrosulphites.

(TO BE CONTINUED.)

THE ANALYSIS OF MATERIALS USED FOR ELECTRICAL INSULATING PURPOSES.

THE criticism of the report of the Analytical Committee of the American Chemical Society, in connection with its work in analyzing materials used for electrical insulating purposes, by the Joint Rubber Insulation Committee, elicited the following reply from the first named body, which we reprint in full from the "Journal of Industrial and Engineering Chemistry," December, 1914:

"From the reply of the Joint Rubber Insulation Committee, this journal, 6, 515, it is evident that some discussion of the results as published in this journal, 6, 514, is necessary to prevent any misunderstanding as to their bearing. Since this reply appeared it was impossible to hold a meeting of the Analytical Committee until this date.

"In presenting the results of their work, the Analytical Committee voted to confine their published report to the facts brought out by their analysis and omit all discussions, as a publication of these discussions in full would have occupied more space than this committee could reasonably have asked for and it was by no means certain how much of it would be of general interest.

"The three compounds selected for analysis were designed to test the accuracy of the methods for analysis of the Acetone Extract as affected by the presence or absence of the two hydrocarbons used in commercial practice. The amount of rubber and the fillers were varied only slightly to avoid the influence of extraneous factors on the results. The selection of fillers and the respective proportions were designed to fall within the limits prescribed by the 1913 Railway Signal Association's specification for 30 per cent. fine Para insulation, as this was considered

to be the most important type of material to which the methods of the Joint Rubber Insulation Committee were likely to be immediately applied. The methods of the Joint Rubber Insulation Committee were intended to be applicable to the analysis of just such compounds. Therefore, if the errors have been magnified due to the constituents, the methods should be revised to meet such conditions.

"The Analytical Committee, before issuing its report, took into consideration the discrepancies of analyst No. 3 under waxy hydrocarbon, which in all probability were due to the solution of alcoholic potash used. They also took into consideration the results of No. 4, under free sulphur, which were obtained by the use of a different type of extractor, for comparative purposes. Inasmuch as no conclusions drawn from either of these results were adverse to the methods of the Joint Rubber Insulation Committee, no exception was made to the decision of the committee to publish only the results and conclusions.

"These discrepancies and the reasons for the same were brought to the attention of the Rubber Section at the Cincinnati meeting and were fully discussed at that time. Two members of the Joint Rubber Insulation Committee, who were instrumental in drawing up the comments printed in this journal, 6, 515, were present at this meeting and were fully acquainted with the facts.

"A clerical error which appeared in the published report should be corrected as follows: Under Sample A, Analyst 1:

11/20—Total waxy hydrocarbons should read 2.14 per cent.

11/21—Total waxy hydrocarbons should read 2.55 per cent.

"Referring to the comments on the work of Analyst No. 2, the Joint Rubber Insulation Committee state: 'The results indicate that the Acetone Extraction was not properly made.' Comparison of the results of Analyst No. 2 with those of Nos. 1, 4 and 5, which are taken as a standard for comparison, does not substantiate this statement, as these results are consistent with Nos. 1, 4 and 5 and the duplicate results are particularly consistent; furthermore, the analyst states that the Acetone Extraction was made absolutely in accordance with the procedure.

"The fact that the averages of a large number of determinations are 'about what we would expect from this compound' proves only that positive and negative errors are equally probable and does not substantiate the claim that the determination of saponifiable extracts by this method will give accurate results, since the individual results show that the probable error of a single determination is large.

"This procedure is given as a method for 30 per cent. *Hevea* rubbers, therefore the Analytical Committee was justified in making its first investigation on fine Para."

E. W. BOUGHTON, W. A. DUCCA, G. H. SAVAGE,
J. B. TUTTLE, P. H. WALKER, D. W. WHIPPLE, *Chairman*,
114 Liberty street, New York City, November 16, 1914.

BISULPHITE NOT BISULPHIDE.

In reporting the remarks made by Mr. Henry P. Stevens at the International Congress of Tropical Agriculture, in the November number of THE INDIA RUBBER WORLD, the speaker was made to say that he used small quantities of sodium bisulphide in the manufacture of pale crêpe plantation rubber. This was an error; the chemical used by Mr. Stevens was bisulphite of sodium.

The introduction of sodium bisulphite as an antiseptic in the treatment of rubber latex in the East was due to Mr. Sidney Morgan, the resident chemist of the Rubber Growers' Association Malaya Research Fund. Samples so prepared were carefully tested, and the use of this substance has now become practically universal in the preparation of pale crêpe rubber.

Announcement has been made by steamship lines operating to South Africa of a reduction in the surcharge on freight to 15 per cent., the old rate having been 20 per cent.

New Rubber Goods in the Market.

RUBBER GOODS FOR THE INVALID

HERE are shown cuts of two new additions to the already long list of rubber articles provided for use in the sick room.

The first is the Easy non-slip bed cushion, a device which provides a comfortable support to the thighs and relieves all strain on the spine and abdominal muscles when the patient assumes a sitting position.

It is also adapted for use in bed for reading, writing or eating. It is also adapted for use in wheel chairs and, in combination with a back rest, it gives the required position for post operative work.

It is 14 x 20 inches in size and is made of pure gum, cloth inserted.

The second is a new style of bed pan, especially constructed both for comfort and service. It is made of fine maroon, cloth inserted, stock, providing a soft inflated cushion for the spine, which is not raised from the bed as is required in the use of the ordinary bed pan. Its generous capacity makes it also suitable for douche purposes. [Davol Rubber Co., Providence, Rhode Island.]

RUBBER TRAVELING ACCESSORIES.

Here are shown several accessories which materially decrease the discomforts of travel. One is a bag for shoes or rubbers, made of leather and having a rubber lining. It is about a foot long and just the thing to protect the other contents of the bag or trunk from the shoes and rubbers, while also protecting the shoes from scratches.

The other cut shows a folding wash basin, made of rubber. This basin is 11 inches in diameter and will fold up—including the soap box and wash cloth in its rubber case—into a space 6 x 8 x 2 inches. [Daniel Low & Co., Salem, Massachusetts.]

SUCTION GRIP FOR LADDERS.

An interesting and useful device is the Morrison Safety Suction Grip, consisting of a small cell-filled piece of rubber, fitted in an iron casting and intended for attachment to either end—or both—of a ladder, to prevent slipping. Another purpose is to render ladders so equipped harmless to the most delicate or highly polished surfaces. This suction foot is made for ladders of every size and the rubber suction grip pad may be readily renewed in the casting. [The Morrison Safety Ladder Foot Suction Grip Co., Lowell, Massachusetts.]

THE "LE ECONOMY" ELASTIC HOSIERY

One great trouble with elastic hosiery is the effect that perspiration has on the rubber thread contained in it. Of necessity this thread is made of almost pure rubber, and is therefore easily affected by perspiration acids. The "Le Economy" hosiery is a new weave which is designed to remove this trouble. Each piece, whatever the application is to be, is knitted separately to a form and with a scientific knowledge of equally divided pressure. [Lee Tire & Rubber Co., Conshohocken, Pennsylvania.]

PANTHER SOLES.

The "Panther" guaranteed fibre rubber sole is one of the newer substitutes for sole leather. It can be easily attached, and the makers' guarantee, under proper treatment, against cracks, breaks or tears in use, covers not only the soles but the cost of the shoes to which they are attached. [Panther Rubber Manufacturing Co., Stoughton, Massachusetts.]

HIPRESS FOOTWEAR.

These goods are cured under pressure instead of in open dry heat. They are called "Little Brothers of the Goodrich Tire"—a high compliment. They are made of auto. tire stock, which of necessity is as tough and durable as can be made.

A radical departure from the ordinary is the color of these boots. Instead of the usual black, they are made either a rich brown or a cream-white, and always with the red border about the top. [The B. F. Goodrich Co., Akron, Ohio.]

"SHEDWET."

Rubber leather, or "Shedwet," is a new material for resoling shoes, said to possess all the merits of both rubber and leather besides a few exclusively its own. It is about the same weight as leather, compared with which it costs a trifle less and is more resilient, is water-

proof and will not slip or skid. It is made in black and tan and with plain and corrugated treads. [Essex Rubber Co., Inc., Trenton, New Jersey.]

NEW SPORT SHOES.

The "Anatomik" is a new straight last golf shoe having a special adaptation to conform to the arch of the foot. It is made for both men and women, the men's style being made in brown ooze-finish leather and the women's in russet chrome, both with rubber heel and sole, the latter having a leather tip. [John Wanamaker, New York.]

The other sole is for tennis shoes. It is an English non-slip rubber sole on the vacuum idea, and the line on which it is in use embraces both men's and women's sizes. [Frank L. Slazenger, New York.]

A factory has been established at LaCrosse, Wisconsin, by William P. Armstrong, for the manufacture of fighting dummies similar to those illustrated and described in the new goods section of our November issue.

A NEW MESSAGE ROLLER.

Many varieties of rubber massage rollers have been introduced from time to time, but here is a new one, described in a circular issued by its maker as "the only patented massage roller having suction cups." These cups are molded in the rubber, their action causing successive depression and elevation of the cuticle. A tube of soft rubber, the outer surface of which is covered with these suction cups, is placed over a hardwood cylinder. A hardwood handle and mountings complete the roller, which is operated by hand. [M. Stonebridge, 4143 Park avenue, New York.]

DRESS SHIELDS AND RUBBER BIB.

A new line of dress shields being produced under the brand "Omo-Elva" contains two distinctive styles worthy of note.

The first of these is a shield of regulation shape, the portion that extends under the arm having attached to it a net upper in the form of a short sleeve. This sleeve has an elastic band around the top to hold it in place over the shoulder, making it easy of adjustment.

The second is the sew-on type of shield, having a small pocket attachment for sachet. This new line is made of pure rubber, double covered with fine absorbent nainsook.

The plain rubber bib has saved many a small child's dress from spots and stains that would have gone through a bib of the ordinary variety—but usually at the expense of some other article, the carpet, for instance, the milk, jelly or crumbs rolling off the bib on to the floor. The waterproof bib with a cover of absorbent material that can be detached and cleansed—which followed the plain rubber sort—absorbs liquids, but does not prevent crumbs from falling on the floor. But the latest bib, just introduced, is an improvement on all

its predecessors, having a pocket that catches all droppings and protects both the clothes and the floor. It is made of rubber and can be washed easily. [The Omo Manufacturing Co., Middletown, Connecticut.]

DENTAL SUCTION CUPS.

Rubber suction cups for dental plates are now being offered, in sets, for either upper or lower plates. One feature of these suction cups is that they are renewable and may be applied or taken off the plate by the wearer in a moment. They are said to be of great assistance in difficult plate adjustments. [Eureka Suction Co., Loudonville, Ohio.]

An ingenious device to remove rain, sleet or snow from the front window of a trolley car or other moving vehicle is the rubber-edged squeegee. This is so arranged that it may be easily moved by turning a handle within convenient reach of the motorman or driver, a metal rod holding the rubber edge of the squeegee firmly against the window.

HOUSEWORK HELPS OF RUBBER.

These several cuts represent the successful carrying out of ideas to relieve housework of a few of its many disagreeable features. The first is an improvement on the long-handled mop. It retains the long handle, but on the end of this there is a toothed crossbar arrangement which resembles a rake. These teeth are made of rubber and are intended to grip the cloth and guide it over the surface to be scrubbed.

Another device, combining water

pail, sponge and drying cloth, is for use in washing windows. This also has a long handle being intended for use on the outside of the window. A shallow reservoir of metal with a sponge at

one side and a rubber "squeegee" on the other is attached to the handle.

The Peerless window

cleaner illustrated is another rubber squeegee. This has a light-weight sheet steel handle with an improved drip catcher, the cleaner

portion being made of hard wood with a rubber strip. [The D. W. Bosley Co., Chicago.]

The fourth cut shows a Japanned sink scraper with rubber edge. Messrs. Takito, Ogawa & Co., of 325 West Madison street, Chicago, are manufacturers and importers of this class of goods.

FUR-LINED MACKINTOSH.

The British manufacturers of mackintoshes are adapting their lines to the needs of the soldiers in the field, and the coat illustrated is one of the latest styles evolved. There is nothing in its general appearance to indicate that it differs from the ordinary. It is different, however, for while cut on the lines of the regulation officer's mackintosh, it has a fur lining, the one garment serving the purposes of mackintosh and overcoat. [Debenham & Freebody, London, W., England.]

The British government has appointed an emergency committee to consider prevention of gun-deafness among soldiers and sailors, the incessant report of guns often causing rupture of the drum membrane. In the French, Japanese and American armies mechanical contrivances are employed to prevent this condition, the American soldiers being provided with a vulcanite device having celluloid ear stoppers.

A new employment for insulated wire is in the propulsion of a scrubbing machine. This is a small push cart apparatus operated by levers on the handle. These levers control a supply of water from a tank, powdered soap, a set of brushes which revolve on the floor, and a pump which sucks up the dirty water as the cart is pushed ahead. The power is supplied through a wire cable connected with a lamp socket.

It is now possible to administer anesthetics at body temperature, thus insuring greater safety to the patient and more rapid and satisfactory absorption. This is effected by the insertion in the rubber inhaler tube of electric wires which heat the vapor before it passes into the inhaler. [The S. S. White Dental Manufacturing Co., Philadelphia.]

A VACCINE TUBE WITH RUBBER BULB.

A new vaccine tube point has been introduced, as herewith illustrated. This tube is made of one piece of glass, easily sterilized, within which the virus is hermetically sealed. When it is desired to use the vaccine a rubber bulb is pushed over the small end of the tube, until the end of the tube projects through the bulb; the flesh is scarified with the point of the tube, but no blood is drawn, and the tube is broken off inside the bulb, through the end of which the broken part is removed. Then the point of the tube is broken off, and the virus is expelled by means of the rubber bulb directly on the scarified area, into which it is rubbed. [H. K. Mulford Co., Philadelphia.]

RUBBER IN MEDICAL AND SURGICAL WORK.

The first of the illustrations below shows the Pleximeter, a hard rubber instrument for use in making diagnoses, for detecting any abnormal condition in a given portion of the body, and especially in sounding cavities of the chest.

The other illustrations show forceps such as are used in intestinal operations. The ends of these forceps have soft rubber tips, which prevent the crushing of the intestines while being brought up in the field of operation. These rubber protections enable the operator to bring

sufficient tension to bear to hold the intestine at any desired point without the laceration liable to result where the ordinary steel instrument is used. [Frank S. Betz Co., Hammond, Indiana.]

MOTOR DRIVEN FIRE EQUIPMENT SUPPLANTS THE HORSE.

The Fire Department of New York has asked an appropriation of \$308,000, to be used in converting the present horse-drawn fire apparatus to motor driven, and for the purchase of new apparatus. The city's present equipment comprises, besides its horse-drawn vehicles, 271 pieces of motor apparatus, 228 motor vehicles having been substituted in the past three years. The present fire commissioner, Robert Adamson, is an advocate of motor apparatus, his preference being based upon greater efficiency, on account of quick response to third and fourth alarms, where a uniformly high rate of speed for distances of perhaps 8 or 10 miles is impossible with horses employed on vehicles weighing from 11,000 to 17,000 pounds; also on the saving in cost and maintenance and in quarters for the department apparatus. If this appropriation is granted by the end of 1917 the city's entire equipment will be of the motor class.

TOY BALLOONS.

The toy rubber balloon with self-closing valve is a distinct improvement over the ordinary variety. Easily inflated, it can be deflated with equal facility, simply by inserting a small stick in the neck of the balloon and holding there until the air escapes, to relieve the strain of inflation when not in use. Such balloons are obtainable in a variety of colors and are adapted for and much in use in many kinds of lawn and indoor games, in addition to their popularity as a children's toy. The cuts show a new cigar-shaped balloon supplied with this valve and which, by the addition of a stick and a colored tissue tassel, becomes a pom-pom balloon, or, by the addition of a paper pin wheel attached to a cork inserted in one end and a string tied to the other, becomes a toy airship. This balloon is made in assorted colors and inflates to 14 inches in length and 4½ inches in diameter. [Gregory Rubber Co., Akron, Ohio.]

BALATA SKI BINDING.

While skiing is not the popular sport here that it is in the Scandinavian countries, where it originated, still, in the colder sections and in Canada it has become a popular winter pastime and the ski constitutes quite an item in the sales of the sport-

ing goods dealers. One of the most important features in the manufacture of the ski is the binding, the balata binding as illustrated above forming one of the varieties most in use. [G. S. Sprague & Co., Boston.]

THE HOME GOLFER.

The accompanying illustration shows a new golf machine, the "Varsity" Home Golfer, patented and produced by a rubber goods manufacturing firm and suitable for parlor or lawn matches. It is not a toy but has been scientifically tested for drives from 20 to 250 yards. The device is arranged for attachment to a solid foundation. When the ball is struck the small metal ring at the base

of the upright spindle to which the golf ball is attached, by its movement on the spindle, indicates whether the ball would have flown high or low—whether or not it would have cleared the bunkers, etc. The force of the stroke moves forward the upright spindle and the crank to which it is attached, thus moving the indicator on the dial and registering the force of the drive. It is said to have been introduced on several ocean liners. [Anderson, Anderson & Anderson, Limited, London, England.]

New Machines and Appliances.

KEMPTER'S MIXER.

THE illustration shows an end elevation in section of a novel mixer or grinder. The trough, which is supported by side frames (not shown), has a hinged section on the right for removing the charge. The two kneaders are journaled in bearings and are driven towards each other in the direction indicated by the arrows. These rolls mix the rubber and compounding ingredients automatically, with a grinding and kneading action, the mass being drawn between the kneaders and the circular walls of the trough. [German patent No. 279,649.]

A—Mixer Trough.
B and C—Kneader Rolls.

DEE'S VULCANIZER, MOLD AND EXPANSIBLE CORE.

IN this invention mechanical pressure is applied to the inner tire casing during vulcanization. It is a combination of vulcanizer press, mold and collapsible and expansible core.

The casing is built up on the core and enclosed in the mold, which is then transferred to the vulcanizer press. The center block is located on the auxiliary piston and the four spring arms inserted. A second mold, containing a tire, is then placed on top

A—Cylinder. B—Ram. C—Platen. D—Auxiliary Cylinder. E—Auxiliary Piston. F—Inlet and Outlet Valves. G—Inlet and Outlet Pipes. H—Vulcanizer Shell. I—Two-part Molds. J—Center Blocks. K—Spring Arms.

of the first mold and a second block is located on the first and the spring arms inserted. This process is repeated until the heater is full. The head is then locked in place, pressure is applied to the molds by the main ram and live steam is admitted to

the heater. Pressure is then applied to the auxiliary piston which raises the center blocks, spreading the spring arms radially. This expands the core, stretches the fabric and shapes the tire and tread against the inner walls of the mold. [United States patent No. 1,120,453.]

A VACUUM VULCANIZER FOR FOOTWEAR.

CROWLEY'S apparatus for vulcanizing hollow articles subjects the inner and outer surfaces to different gases

or vulcanizing media, and also to different pressures. The vacuum chamber shown in cross section is made long enough to support several boot trees held in position by pins. A transverse bar with twisted ends fits in the staggered racks and supports the chamber and trees. The boots are built up on the trees and seated in position on the hollow shell in the work room. Then, with others, it is placed in racks secured in an ordinary heater. Air pressure or vacuum is applied to the interior of the perforated tree through the connections and openings provided for that purpose. [United States patent No. 1,122,695.]

D—Vacuum Chamber. B—Transverse Bar. C—Air Opening. D—Boot. E—Boot Tree. F—Tree Perforations. G—Air Connection. H—Supporting Pins. I—Recks.

MACHINE FOR CEMENTING VAMP LININGS.

GILLESPIE'S machine applies rubber cement to leather shoe linings in an even and uniform manner. The base supports a cement tank in which revolves a felt-covered cement-applying roller. The tank is divided by two adjustable partitions which control the amount of cement fed to the applying roller. The surplus is scraped off this roller and flows back into the tank. The brass presser roller is adjustable vertically. This roller also

A—Base Plate. B—Cement Tank. C—Applying Roller. D—Brass Presser Roller. E—Roller Adjusting Screws. F—Hinged Partitions. G—Partition Adjusting Screws. H—Lower Scraper. I—Upper Scraper. J—Delivery Table.

has a scraper that removes the surplus, which is caught in a trough and returned to the tank. The shoe lining is fed into the

machine from the left, passes between the rollers and is coated on the lower side. It is prevented from clinging to the applying roller by a wire frame attached to the delivery table. [United States patent No. 1,119,820.]

SWINEHART'S TIRE VULCANIZER AND MOLD.

WHEN a tire is being cured by hydraulic pressure applied to the interior, it is sometimes injured by excess pressure. In this device the excess pressure escapes automatically. The tire is placed in the mold and filled with water through the pipe provided for that purpose. The mold is then subjected to pressure in a hydraulic vulcanizer press and live steam admitted. This expands the water in the tire and presses the casing against the inner surface of the mold. In case there is excess pressure within the tire the relief valve opens automatically and allows it to escape. [United States Patent No. 1,122,333.]

A—Two Part Mold. B—Tire. C—Annular Ring. D—Packing Ring. E—Water Pipe. F—Relief Valve.

THE JOHNSTON BEAD TRIMMER.

THE machine shown in the illustration is used in reclaiming scrap tires. It cuts off both beads of quick detachable or clincher tires in one operation. It has a crowned roll A, driven from the motor B by gears C and D. Two pressure feed rolls E, covered by shields F, are held in contact with the roll A by springs G. Back of the feed rolls are circular knives covered by shields H and held down by springs I. The tire is cut and one end fed into the machine under the rolls E and the circular

JOHNSTON BEAD TRIMMER

knives sever the beads from the casing. The cutters are adjusted to cut off beads of all sizes of tires up to 6 inches. With two operators the capacity is 25,000 pounds in ten hours. [The Turner-Vaughn and Taylor Co., Cuyahoga Falls, Ohio.]

OTHER DEVICES.

TORREY'S SHOE BOTTOM FILLER.—This machine keeps the filler material continuously in motion and has a by-pass through which it circulates when the delivery opening is closed. The material is delivered and spread automatically on the shoe bottom. All the operator does is to place the shoes on the jacks and remove them. The machine does the rest. [United States patent No. 1,122,661.]

WEITON'S HYDRAULIC VULCANIZER PRESS.—This press has two rams and cylinders which are bolted to opposite sides of a vertical vulcanizer shell. The upper ends of the rams are attached to a ring shaped cross-head, which has two hooks on the underside for engaging and lifting the vulcanizer door. Two rods attached to the cross-head pass through stuffing boxes in the door and support on their lower ends a floating platen within the shell. The outside rams and cross-head hooks engage and raise the cover while the rods raise the platen. The heater is then filled with molds and the door locked. The rams are raised, and the rods and platen pull the molds up against the cover. [United States patent No. 1,121,214.]

STAPLE'S ROPE PACKING MACHINE.—This invention relates to the manufacture of round packing in continuous lengths. Under the frame of the machine are reels holding the strands of material. These are passed through an assembling ring and around a grooved wheel, where they are gathered together. This core is then passed up through the center of a revolving spool table and attached to a grooved wind-up wheel. Mounted on the spool table are a series of spools containing strands of material. The ends are attached to the core and the spool table is revolved, winding the strands around the core as it is drawn through. [United States patent No. 1,122,168.]

TIRE FABRIC STRIP FEEDER.—Brucker's machine feeds strips of frictioned fabric from stock rollers to a power driven tire core. The reel frame is mounted on a shaft journaled in two side frames. It carries four power driven fabric rollers and four friction driven wind-up rollers for the lining. The feed of the frictioned fabric to the core is regulated by a tension weight and the lining is wound up on a separate roller. When one stock roller is emptied another is brought in position by turning the drum. [United States patent No. 1,121,793.]

NALL'S TAKE-OFF REEL.—This machine spools fabric coated with uncured rubber and interposes the lining at the same time. A square reel frame is mounted on a shaft journaled in two side frames. It supports at opposite corners two lining spool shafts driven independently by chain belting from the center shaft. The coated fabric is attached to the empty fabric spool and the lining from the lining spool is wound up with it when the fabric spool is revolved. When the spool is filled the reel frame is reversed by being rotated. This places an empty fabric and a liner spool, previously placed in the frame, in position to be filled with fabric and lining. [United States patent No. 1,120,520.]

DEES' COLLAPSIBLE CORE.—This core is in four sections, joined by wedge keys and has an annular water groove on the periphery. An inlet conveys water under pressure to this groove and the same pipe acts as a drain. The tire is built up on the core and wrapped or placed in a mold. Before or during vulcanizing water is forced between the core and the tire, which stretches the fabric. A small quantity of water produces the desired result. [United States patent No. 1,117,803.]

NEW TRADE PUBLICATIONS.

THE Gutta Percha & Rubber, Limited, of Toronto, Ontario, has just issued a small but handsome gray booklet devoted to its Maltese Cross tire. This company makes pneumatic tires in plain tread and non-skid styles, the latter being of the straight wall type built with a series of wire cables in the bead finish, with a floating flap to protect the inner tube. The booklet contains various tables, illustrations of standard types of rims and a list of the company's branches and service stations from St. Johns, New Brunswick, to Vancouver, British Columbia.

Firestone racing records form the subject of an attractive folder the Firestone Tire & Rubber Co., of Akron, Ohio, are sending to dealers, with a request to hang it in the window. It treats particularly of the road races recently held through the deserts and over the mountains of California. In the Los Angeles-Phoenix event of 671 miles, the El Paso to Phoenix run of 533 miles and the 300 mile no-stop run at Corona, driven by Barney Oldfield at an average speed of 85½ miles an hour, the first machines to finish were equipped with Firestone tires. The company is justly proud of such a galaxy of victories and the folder, with its map and scenes at the races, is to commemorate them.

"A Year with Nassau Tires" is the title of an artistically designed and handsomely printed pamphlet distributed by their makers, the Thermoid Rubber Co., Trenton, New Jersey. It is mainly devoted to the victories won during the year on Nassau tires by such speed kings as De Palma, Burman, Mulford and Rickenbacher and advice to tire users in connection with the merits of the Nassau tire.

"The Sociological Work of the New Jersey Zinc Co." is admirably described in an illustrated pamphlet by Florence Hughes, superintendent of the Palmerton Neighborhood House, Palmerton, Pennsylvania, established by the above-named company as a social center for its employes and their families, whose social welfare, judging from the pamphlet in question, the company most successfully studies to promote.

"The Staggard" for December, published monthly by The Republic Rubber Co., Youngstown, Ohio, is brimful of reasons why automobilists should use the Staggard tire in preference to any other. The publishers have collected practical arguments in their favor from all parts of the world.

"The Goodrich" for December, with its seasonable cover, is full of Goodrich "meat." The illustrations are particularly fine and well printed, and as they constitute a large share of the contents of the number it is fair to call it a good one.

Boonton Bakelite has a reputation for efficiency as an insulation that has won it a place as a substitute for wood, lard rubber, etc., on electrical apparatus. The fact that it comes from the mold finished accurately to size, all ready for use, with metal inserts in place, makes it economical as well as convenient. Under the title "Molded Insulation" the Boonton Rubber Manufacturing Co., Boonton, New Jersey, issues an attractive catalog of the Bakelite goods.

The Kewaunee Manufacturing Co., of Kewaunee, Wisconsin, who, as "laboratory furniture experts," devote special attention to the manufacture of educational and technical laboratory furniture, send us a copy of their catalog, No. 9, of laboratory furniture, which includes everything in this line needed in the equipment of laboratories for industrial wants and commercial establishments. It contains upwards of 260 pages, with numerous effective illustrations representing laboratory furniture of every description. It gives full particulars as to the purpose, dimensions, construction, shipping weight and cost of every article illustrated and includes testimonials from institutions having similar pieces in use.

The appearance, for the eleventh year, of the Christmas number of the "Times of Ceylon" is announced by that publication in a neat little folder, the tinted cover of which is a reproduction of a water-color sketch of a "proa" in full sail for a palm-fringed shore, while the title page shows a "life size" picture of an Indian rupee, the price of the special number. The interior is devoted to a list of its contents, included in which we note photographs of Estate Kanganies.

Special mention should be made of a particularly fine assortment of high grade colored calendars—some of them printed for leading dealers in rubber footwear—received from the American Lithograph Co. of New York, which for many years has had the reputation of printing a greater variety and a greater number of colored calendars than any other lithograph company in the world.

CALENDARS, ETC., FOR 1915.

WE wish to thank our friends in the trade for what is probably the finest collection of calendars, desk pads and other reminders of the commencement of a New Year that has ever been on hand at one time in this office. Space is not available for merited description of these souvenirs, many of which are so pleasing in design and so well executed as to form reminders of their donors long after the latest date they cover. The following is a list of the contributors to this collection:

CALENDARS.

- Adamson Machine Co., The—Machinery—Akron, Ohio.
- Akron Rubber Mold & Machine Co., The—Akron, Ohio.
- Boston Woven Hose & Rubber Co.—Manufacturers of mechanical rubber goods—Boston.
- Brown & Co., W. G.—Dealers in crude and reclaimed rubbers—Cincinnati, Ohio.
- Daggett, Stanley—Manufacturer and importer of colors, chemicals, etc.—New York.
- Davol Rubber Co.—Manufacturers of druggists' sundries and rubber goods for home and hospital—Providence, Rhode Island.
- Essex Rubber Co.—Manufacturers of rubber soles—Trenton, New Jersey.
- Holmes Bros.—Rubber molds and machinery—Chicago.
- Katzenbach & Bullock Co., Inc.—Importers of chemicals and colors—Trenton, New Jersey.
- Kokomo Rubber Co.—Manufacturers of tires and inner tubes—Kokomo, Indiana.
- Lufbery, Jr., Geo. F.—Manufacturer of chemicals—Elizabeth, New Jersey.
- North British Rubber Co., Limited—Manufacturers of all kinds of hard and soft rubber goods—Edinburgh, Scotland.
- Portage Rubber Co., The—Manufacturers of tires—Akron, Ohio.
- Rubber Products Co., The—Manufacturers of mechanical goods, druggists' sundries and fruit jar rings—Barberton, Ohio.
- Rubber Regenerating Co., Limited, The—Reclaimers—Manchester, England.
- Salisbury & Co., W. H.—Dealers in rubber belting, hose, packing, etc.—Chicago.
- Stamford Rubber Supply Co., The—Rubber substitutes—Stamford, Connecticut.
- Stedman Co., The J. H.—Scrap rubber dealers—Boston.
- Taintor Manufacturing Co., The H. F.—Manufacturers of whitening and Paris white—New York.
- Tyson Brothers, Inc.—Manufacturers of rubber substitutes and chemicals—Carteret, New Jersey.
- West India Committee Circular Publishers—London, England.

DESK PADS, DIARIES, ETC.

- Apsley Rubber Co.—Manufacturers of rubber footwear and clothing—Hudson, Massachusetts.
- Coulston & Co., J. W.—Dry paints and colors—New York.
- Federal Rubber Manufacturing Co.—Manufacturers of tires, inner tubes and mechanical rubber goods—Milwaukee, Wisconsin.
- Lowenthal Co., Inc., The—Scrap rubber dealers—New York.
- New Jersey Rubber Co. Reclaimers—Lambertville, New Jersey.
- Royle & Sons, John—Designers and builders of special machinery—Paterson, New Jersey.

ABOUT A FAMOUS MILITARY ORGANIZATION.

FAMOUS among the military organizations of the United States is the Ancient and Honorable Artillery of Boston, of which Captain Francis H. Appleton, of the rubber reclaiming firm of F. H. Appleton & Son, Inc., has recently been commander. It is famous because of its age, being the oldest military organization in the United States; and famous on both sides of the water because of the notable good fellowship of its members and its many social achievements. It was founded in 1638 by a former member of the Honorable Artillery Company of London, and in 1912, by way of celebrating the opening of its 275th year, it accepted an invitation to visit the parent company in London. The 275th annual record of the company has just been published, which is a book of 272 pages, chiefly devoted to an account of that visit—with Captain Appleton in command—beginning with the invitation, the start from Boston, the voyage across, and including the innumerable attentions showered upon the company in London.

What most impresses one in looking over this book is the fact that the commander of this company at this particular time had perforce to be a very ready speaker, for what with banquets, receptions and unveilings, he was always on the firing line of oratory.

This book will prove not only interesting to the 600 and more members of the company, but to all Americans who enjoy international amenities. It is lavishly illustrated. It was compiled by the Paymaster-Sergeant, Arthur T. Lovell, and printed by the Norwood Press, Norwood, Massachusetts.

FOR BETTER RELATIONS WITH OUR SOUTHERN NEIGHBORS.

"The Development of Intellectual and Cultural Relations Between the United States and other republics of America" is the subject of Publication No. 5 of the Division of Inter-course and Education of the Carnegie Endowment for International Peace. After giving particulars as to the preliminary work of the division, it describes the results of a tour made by a party of university men and educators of the capitals and important centers of the South American nations in the interest of better intellectual relations. The publication, which is edited by Harry Erwin Bard, is published in English, Portuguese and Spanish and has an instructive preface by President Nicholas Murray Butler, of Columbia University, New York, who is Acting Director of the Division.

COTTON GROWING IN THE WEST INDIES.

In view of the increasing importance of the cotton growing interest in the islands, the Imperial Department of Agriculture for the West Indies recently published, in the form of

an octavo pamphlet of 120 pages, "Cotton Cultivation in the West Indies." In a preface to the work the Commissioner of Agriculture for the West Indies, Hon. Francis Watts, expresses his appreciation of the manner in which it has been compiled by Mr. W. Nowell, D.I.C., who prepared the chapters on botany and diseases, the chapter on insect pests being by Mr. H. A. Ballou, M.Sc. The information presented has been brought up to date and numerous photogravure illustrations are included.

THE LARGEST THREE ROLL CALENDER.

BIG machines are an adjunct of big business. That being so the huge calender shown in the accompanying illustration—the largest yet produced—may be taken as an index of the growth of rubber manufacture. This is not for use in home manufactures but is already on its way to England. Speaking first of its dimensions, it is a 28 x 78 three-roll machine, is a trifle over 12 feet high, and occupies on the floor a space 16 x 6 x 9 feet. It is driven by motor and requires from 100 to 200 horsepower, depending on the stock to be calendered. The rolls are chilled, accurately ground, polished and chamber bored. Stuffing boxes are provided for heating or cooling, and the bearings are brass lined, lubricated by sight feed oil cups. The rolls are geared for friction 2 to 3 or even motion, the change being made by keys. All gears are cut double heli-

THE LARGEST THREE ROLL CALENDER.

cal, are encased and run in suitable lubricant.

A motor and controller mounted on one of the side frames drive the vertical adjustment mechanism of the rolls. The power clutch can be disengaged and a hand wheel used for fine adjustment. There are four control levers within easy reach. The first controls the motor or hand wheel drive, the second connects the top and bottom rolls with the motor drive or handwheel, the third and fourth control the worm clutches for the vertical adjustment of the roll necks, independently of each other.

There are also two dial gages attached to the side frames at the front and back for registering the vertical roll adjustment to a one-thousandth part of an inch. These enable the operator to see at a glance the exact thickness of the calendered sheet.

The thrust of the worm shafts is taken up by ball bearings. When adjusting the top roll vertically, ball bearing collars remove the friction of the roll from the vertical screws so that they can be easily turned. The calender sheets from 15 to 45 yards a minute and frictions two-thirds that amount. The take-up and brake can be run either way so that the fabric can be fed in at either side. [The Farrel Foundry & Machine Co., of Ansonia, Connecticut.]

The Obituary Record.

JAMES CLAY HARVEY

DELAYED by the unsettled state of the country, word has but just reached us of the death, in Orizaba, Mexico, on December 11, of James C. Harvey, at the age of 64. This, far too soon, terminates the career of one of the most remarkable men that Central America has known. His life was full of change and romantic effort. He was born at Hamilton, Ontario, of Scotch and English parents, and educated in the schools of the Dominion.

He early evinced a desire to see tropical countries and secured a position as purser's clerk in a steamship line trading between New York and West Indian and Central American ports. Soon afterward he became an articled apprentice in the Castle line of Liverpool. This service extended over a period of six years, during which he visited South Africa, India, Ceylon and Australia, making also several sojournings of some length in planting districts in the Indies.

He took advantage of the opportunities thus afforded to study tropical agriculture under many varying conditions and to advance a deep inborn taste for botanical and horticultural pursuits. He subsequently voyaged to the east and west coasts of South America, finally arriving in California, where he settled, married, and became an American citizen. There he engaged in manufacturing, commercial and horticultural work. But the ruling passion of his life was not to be quenched, and in 1899 he went to Mexico, and spent the greater part of a year in examining the planting regions in the states of Veracruz and Oaxaca. The result was that, in company with a few associates, he acquired land situated in the Trinidad valley district in Veracruz, to which he gave the name of "La Buena Ventura," and about one-half of which he developed and devoted principally to the cultivation of rubber and cacao.

A man of thought and of action, with a keen sense of humor, an enthusiastic botanist, a cosmopolitan of the broadest sympathies and interests, and a raconteur of no mean ability, Mr. Harvey combined all the qualities that go to the making of a delightful companion and staunch friend.

To Mr. Harvey belonged the credit of introducing many useful plants hitherto unknown to Mexico, such as the East Indian jack fruit, cinnamon, African akee fruit, Surinam cherries, grafted Indian mangos, cardamoms, economic bamboos; Indian, Malayan and South American palms; fiber producing plants, such as *Sansiviera Zeylanica*, *S. Guineensis*, and the famous Manila hemp plant (*Musa textilis*); also many newer varieties of pineapples, bananas, oranges, etc., besides an infinity of flowering trees, shrubs and creepers, the cultivation of all of which, with very few exceptions, has proved entirely successful.

Mr. Harvey was a correspondent of the principal botanical stations in the tropics, including the royal botanic gardens at Calcutta, Peradeniya, Singapore, Natal, Mauritius, Seychelles and the Gold Coast, as well as the famous institution at Kew, London, this correspondence relating to the results of experience and new ideas in planting methods, and the interchange of seeds and plants adapted to the respective climatic conditions.

For years Mr. Harvey was the friend and helper of the hundreds of Americans who haunted the Tierra Caliente. His home at La Buena Ventura was the stopping place for botanist, tourist, promoter. He welcomed every white man, helped him in his way, and often went along with him. In the days of the Casteleja craze, he, who was a true believer in that tree, was friend, counsellor, elder brother to the planters.

Never over strong, he taxed his strength for others day in and day out. His particular joy was orchid hunting, and his collection was a large one. He also accumulated by exploration and by exchange the finest collection of palms in Central America.

The last few years of his life were spent in trying to grow *Hevea* rubber on the *Castilloa* plantation already installed. In this he was beginning to have decided success when the civil war in Mexico broke out. Mr. Harvey stayed by the properties under his charge and protected them—sometimes by fighting, at others by persuasion.

H. N. FENNER.

Herbert Nicholas Fenner, president of the New England Butt Co., of Providence, Rhode Island, died of pneumonia on January 5 at his home in that city, after a brief illness.

He was born in Providence, March 13, 1843, the son of Nicholas Arnold and Deborah (Brown) Fenner, and obtained his education in the schools of that city, after which he became associated with the New England Butt Co., succeeding his father. He was for many years treasurer of the company, later becoming its president. He was much interested in public affairs and was also prominent in club life, being a member of many of the important societies and clubs of the State. He is survived by his wife and by one son, Herbert L. Fenner.

JAMES CLAY HARVEY.

THOMAS MORGAN TURNER.

Thomas Morgan Turner, president of the J. Spencer Turner Co., died suddenly on January 10 at his home, 5 West Ninth street, New York. Mr. Turner was born in 1857. After completing his education at the Polytechnic Institute, Brooklyn, in 1876, he entered the firm of which his father, J. Spencer Turner, was one of the founders. In 1905 he became president of this concern, which deals in cotton ducks and fabrics of all descriptions for the rubber trade. He was president of the Consolidated Cotton Duck Co. and an officer in several other important fabric concerns, and a member of the Union League, New York Yacht, Riverside Yacht, Lambs and Republican Clubs.

PROF. F. W. HINRICHSSEN.

Prof. F. W. Hinrichsen, who in spite of his comparative youth had accomplished so much toward solving the chemical problems in the treatment of caoutchouc, and had won an international reputation, fell on the battlefield before Lodz on December 2. His early death, at 38, robs the chemical world of a worker whose achievements would probably have been considerable. He was

born in Berlin in 1877, studied at Berlin University and at Heidelberg, and later was associated with some of the most famous German chemists. He was also the author of several notable books, particularly "Caoutchouc and Its Test," published in 1910.

A. W. BRUNN.

A. W. Brunn, who for a number of years had been identified with the rubber trade of New York, as a crude rubber merchant, died January 23 at his home in Hackensack, New Jersey.

COLONEL R. K. BIRLEY.

By Our English Correspondent.

Colonel R. K. Birley, C. B., V. D., D. L., of the firm of Charles Macintosh & Co., Limited, Manchester, England, died of apoplexy on December 10 at his residence in that city, at the age of 69 years.

He was a son of the late Richard Birley, J. P., D. L., of Manchester, and after leaving Winchester College he studied engineering preparatory to entering the family business of Chas. Macintosh & Co., of which his father was a member. It is understood that the late Col. Birley's wish was to enter the Royal Artillery rather than to become a business man. This desire descended to a later generation, and his son, Major R. A. Birley, wounded and a prisoner in Germany, is a member of this military body.

Unlike most obituary notices dealing with prominent rubber manufacturers, it is not possible in the present case to point to important developments or achievements in the domain of science or technology. The lengthy obituary notices which appeared in the press of his native city dealt more or less ex-

years engineer at the Cambridge street works. In the course of this visit he gained an insight into American procedure, visiting several of the rubber works. Other journeys abroad of a business nature were to Brazil, and to Barcelona, where his firm had a branch establishment for making up proofed cloth. He had for many years been a member of the Society of Chemical Industry. He was a regular reader of THE INDIA RUBBER WORLD, of which he always spoke highly as a technical publication. On the formation of the India Rubber Manufacturers' Association in 1899 he was elected the first chairman.

Col. Birley took a lively interest in the rubber plantation movement and was chairman of the Beaufort Borneo Rubber Co., as well as director of Sablas-North Borneo Rubber Co., the former having been largely subscribed in the Manchester district.

A man of commanding appearance, those privileged to enjoy a close acquaintance found him possessed of a genial nature and a kindly disposition.

The funeral was a military one, the interment being in the family vault at Worsley Church, near Manchester. The firm was represented by Sir Frederick Smith, Bart. (chairman of directors), Colonel Hugh A. Birley, Philip A. Birley and J. Harold Birley, directors, and L. Clay, secretary. James Tints (Irwell Rubber Co.) and William J. Henderson (Ancoats Vale Rubber Co.) represented the India Rubber Manufacturers' Association. There were also present deputations from various military organizations and hospitals in addition to relatives and friends.

ARCHIBALD COLQUHOUN.

The recent decease of Archibald Colquhoun, editor of "United Empire," is a source of sincere regret to those interested in his able work for that publication and to his colleagues in the Colonial Institute. Deceased, who was an earnest and logical advocate of imperial unity and possessed a wide knowledge of the world and its peoples, although so vigorous in his mentality and decided in his opinions, was so kindly and considerate in their expression as to gain friends on every hand. "United Empire" personified his sincerity and intellectuality.

Jacob Cordier, for over fifty years connected with the American Hard Rubber Works at College Point, New York, died December 30 at the Flushing Hospital. He was born in France in 1839.

Samuel C. Kale, for the past 14 years in the employ of the Faultless Rubber Co., of Ashland, Ohio, died in that city on December 15, of heart failure. He was 53 years of age and is survived by his wife, a daughter and two sons.

H. C. Bissell, for more than 20 years with the Habirshaw Wire Co., of Yonkers, New York, died January 21 at his home in that city, of pneumonia.

RUBBER IN INDO-CHINA.

According to the official statistics in the "Bulletin Economique" of Indo-China, the exports of crude rubber in 1912 represented \$203,008, and in 1913 \$151,809. The falling off was caused by the decline of the article in value.

Experiments with *Hevea Brasiliensis* reported from Cochin China, show a distinct connection between the weights of the seeds planted and the height of the stems after twenty weeks' growth. In four groups of seeds the results show average weights of one-tenth, one-eighth, one-sixth and one-fifth of an ounce; the average height attained within the period stated being 10, 17, 22 and 26 inches. One-seventh of an ounce was considered the minimum weight for insuring good results.

From the India Rubber Journal

COL. R. K. BIRLEY.

haustively with the deceased's long connection with the volunteer artillery, dismissing his business connection in a single line. These military activities engrossed his attention for nearly half a century and obtained for him the Volunteer Decoration, the Deputy Lieutenantship of the County of Lancaster and, last but not least, the Companionship of the Most Honorable Order of the Bath.

To a greater extent than any of his partners of thirty years ago Colonel Birley took an interest in science and it was on his initiative that the works' laboratory was founded on a modest scale in 1884. In the late 70's he paid a visit to the United States, in company with Thomas Williams, who was for many

News of the American Rubber Trade.

WALPOLE SALE AND DIVIDEND.

A SALE will be held at Walpole, Massachusetts, at 11:30 a. m. on Wednesday, March 10, to dispose of the business of the Walpole Tire & Rubber Co. This business will be sold as a whole and as a going concern, and bids may be submitted without other restriction than that each be accompanied by a certified check for \$50,000.

An appropriation of \$37,500 has also been made from the funds in the hands of receivers for the payment of a 3 per cent. dividend to creditors, on claims allowed up to January 4. There have been three previous dividends of 4 per cent. and one of 10 per cent., making in all 25 per cent.

UNITED STATES RUBBER CO. MEETING.

After the meeting of the Board of Directors of the United States Rubber Co. held January 7, the president, Samuel P. Colt, gave out the following statement:

"The Board of Directors of the United States Rubber Co. at their meeting held this day declared the regular quarterly dividends upon the preferred and common stocks of the company, namely, 2 per cent. upon the first preferred, 1½ per cent. upon the second preferred and 1½ per cent. upon the common.

"The treasurer's statement as submitted to the meeting showed the net earnings of the company for eleven months, from January 1 to November 30, 1914, sufficient to cover the dividends declared for the year 1914, including those declared today. There was no estimate of the December earnings submitted, but whatever they may be will be additional to the dividend requirements.

"While there has been some improvement in the business for December, which is continuing into January, the existing war introduces an unprecedented uncertainty into the situation.

"There is every reason to believe that the embargo placed by Great Britain upon the importation of crude rubber will be so modified as not to embarrass the company in obtaining its requirements of the crude material."

RUBBER COMPANY DIVIDENDS.

The United States Rubber Co. has declared a quarterly dividend of 2 per cent. on its first preferred stock, a quarterly dividend of 1½ per cent. on second preferred stock and a quarterly dividend of 1½ per cent. on its common stock, payable January 30 to stockholders of record on January 15.

The Canadian Consolidated Rubber Co., of Montreal, Quebec, declared a regular quarterly dividend of 1¾ per cent. on the preferred stock of the company, payable December 31 to stockholders of record on December 19, but has passed the dividend on its common stock.

The American Chicle Co. has declared a monthly dividend of 1 per cent. on its common stock, payable February 20 to stockholders of record on February 15.

The Racine Rubber Co., of Racine, Wisconsin, paid on January 2 its 11th regular quarterly dividend of 1¾ per cent. on the preferred stock of the company, which is 7 per cent. cumulative.

The Hood Rubber Co., of Watertown, Massachusetts, has declared its 28th consecutive quarterly dividend of 1¾ per cent. on the preferred stock of the company, payable February 15 to stockholders of record on January 28.

The Fisk Rubber Co., of Chicopee Falls, Massachusetts, has declared a regular quarterly dividend of 1¾ per cent. on its preferred stock, payable February 1 to stockholders of record on January 21.

THE FEDERAL RUBBER MANUFACTURING CO.

The Federal Rubber Manufacturing Co., of Milwaukee, Wisconsin, is again adding to its plant, having completed plans for a three-story addition 124 x 44 feet, of brick and mill construction.

This company is manufacturing a special "Redskin" inner tube, the distinguishing feature of which is a valve base reinforced by extra thickness of rubber, vulcanized integrally with the tube and therefore a part of it. This reinforcement, which cannot break or work loose, is claimed to add materially to the strength of the tube. To protect the tube from injury in transit, it is enclosed in a red cloth bag before being packed in its carton.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A Portuguese importing firm is in the market for automobile tires which are stated to be for its branch house in South America. Prices f. o. b. New York or c. i. f. South American port are desired. Report No. 15,007.

A manufacturer in Europe wishes to communicate with manufacturers of vulcanite tubes for fountain pens. Report No. 15,096.

A dealer in France would like offers on dental supplies of all kinds. Report No. 15,104.

A dealer in the Far East desires names and addresses of manufacturers of sporting goods, bicycle tires, etc. Report No. 15,167.

An electrical engineer in a leading South American city asks for catalogs and prices on electrical supplies, wire, cable, etc. Report No. 15,184.

A foreign import and export agent desires to be put in correspondence with exporters of unvulcanized rubber rings for preserve jars. Report No. 15,210.

A business man in Russia wishes to get in touch with American manufacturers of rubber ribbons similar to samples which may be examined at the Bureau of Foreign and Domestic Commerce and its branch offices. Large quantities of this material are imported into Russia. Report No. 15,250.

A dealer in Great Britain wants to secure agencies for rubber goods, such as surgical articles. Report No. 15,317.

A firm in the United Kingdom which manufactures surgical trusses wishes to form commercial relations with manufacturers of imitation rubber pads. Report No. 15,351.

A European business man desires to act as representative for American manufacturers of balata and other belting. Report No. 15,357.

A general import agent in Norway desires to represent, on a commission basis, American exporters of rubber goods. Report No. 15,378.

A recent decision of the Board of United States General Appraisers sustained the protest of The B. F. Goodrich Co., of Akron, against assessment at 15 per cent. on wire staples used in anchoring cords while they are being knitted into form for use in making automobile tires. This article properly comes under paragraph 554 of the 1913 tariff, entitling it to free entry.

Imports of new scrap rubber are entitled to free entry, according to a decision handed down on January 19 by the Board of United States General Appraisers, protest having been entered by N. E. Berzen against the assessment at 10 per cent.

SOME RECENT CUSTOMS RULINGS.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

WILLIAM T. COLE.

MR. W. T. COLE, president of the Mechanical Rubber Goods Association from 1908 until December 10 last, and now chairman of the "Mechanical Group" of the Rubber Club, is very much a "live wire." The brief of his business career, sketched by himself, is so well done that we quote:

"My life is an open book, or rather ledger, and I will tell you the little story in the first person, leaving it to your ac-

WILLIAM T. COLE.

knowledge editorial skill to make it readable. Do not accuse me of trespassing, as you took down the bars and invited me in.

"I was born in Paterson, New Jersey (1863), where my father was engaged in building locomotive frames for the Cooke, Rogers & Grant Locomotive Works, located in that city. (I chuckle to recall that Colonel Colt also admits being born in Paterson.)

"I enjoyed an academic education supplemented by a business course and technical training; all of which more or less qualified me to enter (as an employee) the First National Bank of Paterson immediately after my graduation. I remained with the bank for several years, and the recollection of that association is the grandest of my business life, on account of the magnanimity of the broad-minded man composing the Board of Directors and constituting the official staff, in permitting me to engage in outside business to occupy the time before 9:00 A. M. and after 3:30 P. M., and thus keep in check the youthful energy with which I was imbued. I accordingly, in conjunction with two of my closest friends, organized a stock company, of which I was treasurer, for the purpose of manufacturing silk ribbons and brook silk. After two years the business was so well established that I resigned from the bank and merged myself into the firm of Cole & Kuett, with manufacturing plants at Paterson and Sterling, New Jersey.

"The emancipation of women began in 1893, with the advent of tailor made suits, and the silk business was consequently demoralized to an alarming extent, so I said farewell to the fickle *Queen de Soie* and swore allegiance to King Cotton (with a rubber lining) and established myself in the domain of the Fabric Fire Hose Co. I am now, and have been for several years, president and general manager of the Fabric Fire Hose Co."

Mr. Cole is very much of a stickler for the rights of the individual manufacturer. He therefore led in the fight that the Mechanical Rubber Goods Manufacturers' Association made

against the demands of the Insurance Laboratories as to fire hose. In this work he showed himself not only a clear and logical reasoner, but possessed of a trenchant wit and a happy faculty for stating facts that is as pleasant as it is rare. Some of his essays on the rubber manufacturers' position in not being willing to turn over their factories to outsiders and pay them for the privilege, are classics.

PERSONAL MENTION.

Following the resignation on January 23 of C. I. Wilson, purchasing agent of the Boston Woven Hose & Rubber Co., of Boston, J. B. McMahon, who has held the position of assistant purchasing agent, was promoted to the vacancy, M. G. Hopkins becoming assistant.

H. Esmond Bailey, son of C. J. Bailey, 22 Boylston street, Boston, is now associated with his father in promoting the sales of the Bailey "Won't Slip" heel.

G. H. Elliman, chemist for the King Rubber Co., of Clarendon Hills, Massachusetts, has developed a special compound for use in rubberset brushes. Mr. Elliman was previously employed as chemist by the Boston Woven Hose & Rubber Co., the B. & R. Rubber Manufacturing Co., and the Davidson Rubber Co. Mr. Elliman recently joined the King organization.

E. L. Hill, formerly superintendent of the insulated wire and power cable plant of the American Steel & Wire Co., at Worcester, Massachusetts, is now consulting engineer of the Hazard Manufacturing Co. at Wilkes-Barre, Pennsylvania.

Edward C. Southwick, who for the past three years has been traffic manager of the Revere Rubber Co. at Providence, Rhode Island, was elected January 1 to a similar office with the Providence Chamber of Commerce.

John V. Mowe, for a long time identified with the sales forces of the Firestone Tire & Rubber Co. and the Goodyear Tire & Rubber Co., of Akron, has been appointed assistant sales manager of the Kelly-Springfield Tire Co. branch at Detroit, Michigan.

D. C. Hathaway has also associated himself with the Kelly-Springfield company, at Cleveland, Ohio. He is well known to the trade of that section, where for a number of years past he has represented the Firestone Tire & Rubber Co.

The Republic Rubber Co., of Youngstown, Ohio, is about to open a branch in London, of which Frank V. Springer, who has been head of the eastern sales department, with offices in New York, will be manager. Mr. Springer will be succeeded in New York by Herbert W. Bixler, formerly assistant general sales manager of the company at Youngstown.

Walter W. Macdonald informs us that he has severed his connection with the Patterson Rubber Co., Lowell, Massachusetts, to accept the position of superintendent of the Century Rubber Co., Plainfield, New Jersey.

A. O. Holroyd, who will be recalled as the pioneer in the introduction of the Dunlop tire in the United States, is now a resident of Daytona, Florida. He is one of the owners of the Prince George Hotel.

Frederic H. Sanford, formerly of Manaos, Brazil, where he was manager of the Adelbert H. Alden Co., Limited, is at Miami, Florida. Mr. Sanford, wife and son had settled in Switzerland, but came to the United States at the outbreak of the war.

C. Gehring, manager of the Paris branch of The Philadelphia Rubber Works Co., manufacturers of reclaimed rubber, of Akron, Ohio, is now in this country, where he expects to remain until the close of the war and resumption of business on a large scale in France.

J. S. McChirg, formerly of Akron, has with others reorganized The S. & M. Rubber Co., of Coshocton, under the name of The McChirg Rubber Co.; authorized capital stock, \$250,000.

L. A. SUBERS AND HIS FABRICS.

THE fabrics are descriptively known as "laminated, cohesive, interwound" and are the results of many years of work on the part of the inventor. First perhaps a word as to this same inventor. He is L. A. Subers, of Cleveland, Ohio, where he was born in 1865. Educated in public and private schools, he studied mechanical engineering under his father, who was

L. A. SUBERS.

an architect and builder and identified with the manufacture of machinery. He became interested at an early age in the development of new inventions, taking out his first patent in 1886.

He also studied corporation and patent law for the purpose of fully familiarizing himself with the establishment of industrial corporations, and also for the purpose of protecting his inventions.

Then, after having been identified with various corporations, he seriously took up the development of his new fabrics for the manufacture of a certain line of rubber products. For seven years he experimented and patented. Some 30 patents are soon to appear here and abroad covering this particular series of fabrics, machinery, processes and devices, in the most important countries of the world.

Mr. Subers has been so long in the atmosphere of the great American patent that he unwittingly talks its language. For example, in describing his fabrics he says

"The primary principle upon which my fabric is built is based upon a laminated, cohesive, interwound principle which naturally is of a tubular form, consisting of yarn elements in numerals.

"That is to say, ordinarily I may use 23-1 cotton from 12 to 18 ends up, 16 of these spools constituting the principle of lamination. In other words, take 23-1-14 ends up as an example; sixteen spools, 14 ends on a spool, would be 224 yarns, making a band of tubular form collapsed, thereby having selvage edges, said yarn elements being laid at a predetermined angle to the axis of the mandrel, usually being $2\frac{1}{2}$ inches or more. The angle at which these yarns are laid or incorporated determines to a great extent the extensibility of the finished tubular, collapsed band.

"Some of the fabric is made from 37-1-25 ends up, thereby having a total of 400 yarns in the finished band, the band averaging from $\frac{1}{2}$ inch to $\frac{3}{4}$ inch in width, and of a thickness averaging $\frac{3}{64}$ inch and up. In the construction of this band I

utilize rubber compound or cement, or any other suitable adhesive, depending on the purpose for which the same is intended, and at the same time I incorporate among said yarn elements ribbon bands of rubber, so that when the entire product, consisting of rubber in the form designated and the yarn elements, is finished, the band of the character described is the result.

"In building tire fabrics and hose of various diameters I am able by the angle at which these yarn elements are laid in the band, and also by the predetermined amount of stretch that is taken out of the band itself before being incorporated into a fabric, to control under pressure to a minimum the elongation, contraction, expansion, twisting and writhing conditions which now exist under the old method of constructing like articles of manufacture.

"That is to say, I can control my fabric to a minimum by the use of the same cotton and the same rubber as is now in vogue by the old method of loom weave, braiding, etc. By my process of distributing the rubber through a large number of yarns, I obtain results heretofore unknown in the art of manufacture of rubber goods of a specific character.

"As an example, the railroad officials have a machine that is called a pounding machine to test air brake hose. Under my principle of constructing air brake hose, the difference in results is as follows: Most any make of air brake hose on the market today, under this severe test, will pound through the rubber and fabric at from five to fifteen blows. In the same thickness of hose, and primarily the same composition of rubber and cotton, my hose will stand not less than fifty blows.

"In all my hose tests I obtained practically one-third more bursting pressure than any hose tested, in comparison with what I have been able to find."

THE INDIA RUBBER WORLD has been in touch with the Subers laboratories for a number of years and has seen some wonderful strength tests in hose and other fabrics. At the present time the Goodyear Tire & Rubber Co., of Akron, has been licensed to use the Subers machines on lease. If we understand Mr. Subers' late communications aright, other companies will be granted licenses, the machines being built and owned by the patentees, The Subers Fabric & Rubber Co.

TRADE NEWS NOTES.

The Marathon Tire & Rubber Co., of Cuyahoga Falls, Ohio, has under way a new addition to its tire manufacturing plant.

The new list of the Fisk Rubber Co., which went into effect January 1, quotes reduced prices on white non-skid casings and gray tubes, and announces the addition to the line of the Fisk non-skid "Red Top" tire and red tubes, an attractive new proposition at approximately the old prices.

The McGraw Tire & Rubber Co., of East Palestine, Ohio, has opened a branch at 667-9 Boylston street, Boston, in the building formerly occupied by the Diamond Rubber Co. Wallace G. Page, for several years general manager of the tire department of the Hood Rubber Co., is manager of this new branch.

The John H. Parker Co., of Malden, Massachusetts, is calling the special attention of the drug store trade to his bathing shoe proposition. The chief line of this company, which started in 1865, is rubber boots with leather soles, but it has specialized for many years in bathing shoes and is now producing an extensive and attractive line.

United States imports of chicle amounted in November last to 435,000 pounds, almost double those of the previous November, which totaled 223,000 pounds.

"Rubber and Its Manufacture" was the subject of an address by Frank H. Van Derbeck, of the Hewitt Rubber Co., of Buffalo, New York, at the meeting of the Society of Chemical Industry on December 14 at Cleveland, Ohio.

NEW COMPANY TO HANDLE SALES OF DODGE MANUFACTURING CO.

The Dodge Sales & Engineering Co. has just been organized and incorporated to distribute in the United States and abroad the products of the Dodge Manufacturing Co., manufacturers of power transmission machinery. The new company takes over the sales and engineering departments of the Dodge Manufacturing Co., warehouses and branch sales and engineering stations in the principal cities of the United States, except Seattle (Washington) and Portland (Oregon). In these two cities the Link Belt & Dodge Products Co., incorporated in October, 1914, under the laws of the State of Washington, will handle all sales and engineering.

Duncan J. Campbell, for many years general sales manager of the old company, goes to the new corporation as vice-president and general manager, taking with him the sales department. The general offices will remain at Mishawaka, which has been the home of the Dodge Manufacturing Co. for 31 years. C. R. Trowbridge, of that city, continues in charge of the department of sales promotion.

NEW INCORPORATIONS.

Bay Ridge Rubber Corporation, January 20, 1915; under the laws of New York; authorized capital, \$6,000. Incorporators: M. Seltzer, 213 First avenue, New York; M. DeWalthorff, 451 Forty-seventh street, and F. Wimpie, 5612 Sixth avenue—both in Brooklyn, New York. To manufacture inner tires, tubes, etc.

Chicle-Mint Corporation, November 30, 1914; under the laws of New York; authorized capital, \$20,000. Incorporators: W. O'D. Laugley, and A. G. Laugley—both of 97 Seventy-second street—and A. B. Roth, 1308 Avenue R—all in Brooklyn, New York. To deal in chewing gum.

Goodspeed-Holder Co., January 11, 1915; under the laws of New York; authorized capital, \$5,000. Incorporators: T. H. Goodspeed and J. W. Goodspeed—both of 122 Monroe avenue, Grand Rapids, Michigan—and G. E. Reed, 306 West One Hundred and Fourth street, New York. To deal in rubber, etc.

Heina Tire Co., Inc., The, January 15, 1915; under the laws of New York; authorized capital, \$15,000. Incorporators: William H. Heina, 506 West One Hundred and Thirty-fourth street; E. V. Derks, 810 East One Hundred and Seventy-ninth street—both in New York—and Edward A. Kammler, 618 Newark avenue, Jersey City, New Jersey. To manufacture tires, etc.

Heliclox Tire Co., Inc., The, January 7, 1915; under the laws of New York; authorized capital, \$100,000. Incorporators: T. H. Soule, Hotel St. Andrew; I. E. Maginn, 434 West Twenty-third street—both in New York—and S. W. Rogers, 156 Highland avenue, Jersey City, New Jersey. To manufacture puncture-proof armor for automobile tires, etc.

International Wire Tire Co., The, November 28, 1914; under the laws of Delaware; authorized capital, \$1,000,000. Incorporators: J. S. Lyons, 412 North Maine street; G. T. Brown, 40 North Main street—both in Wilkes-Barre—and T. A. Zukoski, Plymouth—all in Pennsylvania. To manufacture automobile tires, rims and accessories and to sell automobiles.

Mecca Rubber Co., Inc., January 5, 1915; under the laws of New York; authorized capital, \$1,000. Incorporators: E. J. Kern, 36 Morningside East; K. W. Tompkins, 222 West One Hundred and Forty-first street—both in New York—and G. B. Marshall, 928 Lafayette avenue, Brooklyn, New York. To manufacture automobile tires and rubber goods.

Chester Rubber Tire and Tube Co., January 2, 1915; under the laws of West Virginia, authorized capital, \$2,000,000. Incorporators: P. Freshwater, J. C. Freshwater, E. Freshwater, A. L. Skinner and G. A. Hasson—all of Chester, West Virginia. To manufacture automobile tires and other rubber goods.

Merrill, Inc., Edwin W., January 15, 1915; under the laws of

New York; authorized capital, \$15,000. Incorporators: Grace P. Merrill, E. P. Merrill—both of Lestershire—and F. E. Spaulding, Binghamton—all in New York. To deal in shoes and rubbers at retail.

Monarch Rubber Co., The, December 28, 1914; under the laws of Ohio; authorized capital, \$1,000,000. Incorporators: E. L. Henderson, J. B. Feidler, R. E. Henderson, F. W. McCoy and H. R. Kemerer. Location, Carrollton, Ohio. To manufacture roller and rubber goods, automobile tires, etc.

Monarch Stitched Tire Co., The, December 23, 1914; under the laws of Maine; authorized capital, \$500,000. Incorporators: H. Mitchell (president), H. A. Paul (treasurer), M. G. Mitchell and H. Mitchell—all of Kittery, Maine. To manufacture automobile tires and inner tubes, etc., and to establish selling agencies on a wholesale and retail basis.

National Tireseal Co., Inc., January 15, 1915; under the laws of New York; authorized capital, \$100,000. Incorporators: D. Bloch, 157 West Fifty-fourth street; G. W. Lebolt, Twenty-third street and Fifth avenue, and S. Stern, 158 East Seventy-second street—all in New York. To manufacture a secret compound for sealing tires, etc.

New Castle Rubber Co., The, January 13, 1915; under the laws of Pennsylvania; authorized capital, \$500,000. Incorporators: J. S. Wilson, E. N. Ohl, J. D. Rhodes, C. H. Bolton and W. H. Schoen—all of Pittsburgh—and A. C. Hoyt, New Castle—both in Pennsylvania. To manufacture tires and inner tubes from rubber and other material, automobile accessories and all other articles of commerce from rubber or from rubber and other material.

Peerless Waterproofing & Products Co., Inc., December 26, 1914; under the laws of New York; authorized capital, \$5,000. Incorporators: A. Garfein, 867 Hunts Point avenue; G. Goldman, 1043 Teller avenue, and G. S. Powers, 540 West One Hundred and Fifty-eighth street, New York. To manufacture waterproofing, dust and damp proofing compounds and chemical compositions.

Physicians & Dentists Products Co., Inc., January 15, 1915; under the laws of New York; authorized capital, \$250,000. Incorporators: A. J. Cooke, S. J. Metro and Chas. F. Blair—all of Buffalo, New York. To manufacture plasters, surgical supplies, elastic bandages, etc.

Pure Gum Co., Inc., The, November 21, 1914; under the laws of New York; authorized capital, \$300,000. Incorporators: F. Baumer, 40 West Thirteenth street; H. S. DeCamp, 317 Riverside Drive, and M. Mulet, 45 Broadway—all in New York. Chewing gum business.

Rubber Research Corporation, December 17, 1914; under the laws of Massachusetts; authorized capital, \$15,000. Incorporators: R. C. Harlow, Plymouth; J. H. Stedman and A. N. Hunt, Braintree, and D. A. Cutler, Fairhaven—all in Massachusetts. To manufacture and deal in rubber, rubber compositions, rubber goods, rubber scrap, etc.

Rubber Tire Co., The, December 11, 1914; under the laws of Ohio; authorized capital, \$10,000. Incorporators: O. J. Schwab, J. F. Davey, N. M. Greenberger, F. Falch and H. A. Sullivan. Principal place of business, Akron, Ohio. To manufacture rubber products.

Schoonmaker Co., Inc., E., January 5, 1915; under the laws of New York; authorized capital, \$25,000. Incorporators: E. Schoonmaker, L. N. Mansuy—both of 835 Seventh avenue, New York—and H. I. Huber, 215 Montague street, Brooklyn, New York. General tire manufacturing business.

Wisconsin Tire Co., December 28, 1914; under the laws of Wisconsin; authorized capital, \$40,000. Incorporators: C. A. Bading (president), 294 Farwell avenue, and L. M. Koticki (secretary), 617 Fourth avenue—both of Milwaukee, Wisconsin.

TRADE NEWS NOTES.

The Atlantic Rubber Co. has recently moved from Hyde Park to its new factory in Atlantic, Massachusetts. In addition to its present line of notions, raincoat cloth and hospital sheeting, the company will add carriage cloth, rubber heels and soles and other molded goods, possibly including sundries later. The new location affords excellent rail and water shipping facilities.

John H. H. McNamee, of the Bay State Insulated Wire Co., Hyde Park, Massachusetts, recently secured a charter for the operation of a new banking concern, to be known as the Prudential Trust Co., of which he is president. The new company is capitalized for \$200,000, already over-subscribed. The only other member of the rubber trade identified with its management is John E. Green, of the Green Electrical Co., who is vice president and a member of the executive committee. The Prudential Trust Co. will be located in the vicinity of Summer street, Boston, and will be open for business in July of this year.

The Boston Yarn Co., which specializes in fabrics for the tire trade, has moved its offices from 161 Devonshire street to 60 Federal street, Boston.

At a luncheon recently given by the New York branch of the Thermoid Rubber Co., of Trenton, New Jersey, to the members and staff of the Weaver-Ebling Automobile Co., newly appointed agents for Nassau tires, J. O. Stokes, president of the Thermoid company, spoke on the policy of that concern; D. O. Pohlman, sales manager, discoursed on factory equipment and results given by Nassau tires in 1914, and J. N. Kirk, Jr., of the New York branch, described conditions in the local tire field.

The Knight Tire & Rubber Co., of Youngstown, Ohio, has opened a branch in New York, at 215 West Fifty-first street, in charge of L. I. Ris, who in the past has been associated with several of the tire manufacturing concerns. H. J. Woodward is eastern district manager for the Knight company, having general direction of the operation of the branches at Baltimore, Philadelphia, New York and Boston.

Rubber reclaimers met January 14 at an enjoyable dinner tendered the Rubber Reclaimers' Club by Mr. William T. Rodenbach, founder of that organization. The dinner took place at the Graduates' Club, New Haven, Connecticut, and the president of the club, Captain F. H. Appleton, and others present made speeches.

The Rubber Trading Co. are now located at 9 to 15 Murray street, New York—not in the Postal Telegraph Building, as stated in our January number, but in the adjoining building. Our previous remarks as to the excellent situation and spacious convenience of their new quarters call for no correction.

The Rotary Club assembled at the Hollenden, Cleveland, Ohio, on January 11, at a banquet. The post-prandial oratory consisted of a discussion of the rubber industry, in the course of which a demonstration of the construction of an automobile tire, from the raw material, was given. The difficulty of obtaining the product was particularly referred to by the speakers. As souvenirs of the occasion, the guests received paper weights in the form of a cross section of an automobile tire, furnished by the Harris Henderson Tire Co., of that city.

The plant at Plainfield, New Jersey, operated for several years by the Century Tire Co., but which has been idle for some time, has been acquired by the Standard Tire & Rubber Co., of Boston, hitherto engaged in the jobbing trade. The factory will be used to turn out a line of tires suitable for the trade thus developed. William Cronin, head of the Standard company, was at one time New England manager for the Diamond Rubber Co.

BOSTON RUBBER SHOE CO. TAXATION SUBJECT OF CITY APPEAL.

The city of Malden, Massachusetts, in which is situated the factory of the Boston Rubber Shoe Co., of Boston, has been sustained by the Board of Appeals in its protest in the matter of tax assessment against that corporation. The Tax Commissioner, in computing this company's tax for 1914 deducted an item of considerable amount for account receivable in New York, property situated outside the state being subject to taxation where situated. In the appeal it was contended that the law on this point had been erroneously interpreted by the Commissioner and that, the assessment against the corporation being too small, the city of Malden received a return less than that to which it was entitled.

THE SHOE WHOLESALE'S WINTER MEETING.

The winter meeting of the National Association of Shoe Wholesalers, held at the Copley-Plaza, Boston, January 9, was attended by several of the rubber men prominently identified with footwear manufacture. F. C. Hood, president of the Hood Rubber Co., of Watertown, Massachusetts, addressed the meeting and expressed satisfaction with the change in date of announcement of annual rubber discounts from January 1 to July 1, suggesting as a further reform the division of discounts into two classes—dull finished goods made to fit the feet (such as arctics, boots and lumbermen's overs), and bright finished goods made to fit leather shoes, which are subject to frequent changes in style.

The address by L. D. Apsley, president of the Apsley Rubber Co., of Hudson, Massachusetts, dealt chiefly with the export trade. He called attention to the fact that by supplying inferior goods at prices which European manufacturers are willing to accept for a superior article, unscrupulous dealers have ruined the American manufacturer's chances in certain markets. He declared that the sharp practices of exporters constituted the greatest obstacle to extension of the foreign trade of our manufacturers and made a strong plea for greater efficiency and integrity in export methods.

TO PROMOTE TRADE DEVELOPMENT.

The Rubber Research Corporation, recently organized under Massachusetts laws, was formed to assist the rubber trade in its line of development. That it is unique in province and scope is indicated by the following statement of its president:

"The field which this company intends to cover is a very broad one. For instance, if a party has conceived some idea in regard to rubber and wishes help in placing this on the market or developing it, we will do this. If a crude rubber plantation desires to place upon the market a crude rubber to satisfy any customer, we propose to help. If a manufacturer desires a crude rubber of a certain specific grade or form we propose to place him in a position to procure such rubber according to his ideas if possible. If a company about to be formed, or already formed, desires the help of experienced men to lay out their plant, or any part of it; to organize their working force, or any part of it; we propose to make it our business to do this for them. If a rubber manufacturer desires to make any special article, or has trouble to make an article which he can sell if made properly, we propose to take the responsibility of doing this for him.

"In other words, we will attempt to commercialize any problem that any manufacturer, person, or concern may wish to have us undertake."

The officers of the company, which has its headquarters at South Braintree, Massachusetts, are: David A. Cutler, president; R. C. Harlow, vice president, and J. H. Stedman, treasurer. Mr. Cutler has had long experience in rubber research work. He was recently associated with the Acushnet Process Co., New Bedford, Massachusetts.

CAPITAL STOCK CHANGES.

The Hood Rubber Co., of Watertown, Massachusetts, has increased its common stock from \$1,000,000 to \$2,000,000, and has issued \$150,000 additional preferred stock, to be sold at a price netting the company above par, the proceeds to be used for additional working capital.

A special meeting of stockholders of the Quality Tire & Rubber Co., of Hartsville, Ohio, was held on January 19, to authorize an increase of capital stock from \$75,000 to \$500,000, the end in view being an increase in productive capacity to 300 automobile tires per day.

The Falls Rubber Co., of Cuyahoga Falls, Ohio, has increased its capitalization from \$200,000 to \$300,000.

WAR ORDERS.

The New Brunswick, New Jersey, plant of the United States Rubber Co., has had a share in the war business received in this country, rush orders calling for January 15 shipment occupying this plant at top speed for three weeks without even a let-up on New Year's day.

Calvet Rosenthal, who arrived in New York, January 12, by the "Minnetonka" from London, representing himself as special agent for the French government, stated that he was authorized to purchase, among other things, 2,000,000 pairs of rubber gloves and 1,000,000 pairs of wire nippers, the latter to cut barbed wire and the former for protection against electric shocks.

Other orders reported include one for rubber shoes placed with the Boston Rubber Shoe Co., of Boston; a \$500,000 order for uniforms with the Kenyon Co., manufacturers of weatherproof garments, Brooklyn; 1,000,000 yards of duck—variously distributed; automobile trucks to a value of about \$18,000,000, and 200 war aeroplanes.

WHAT SHOE MANUFACTURERS SAY ABOUT RUBBER SOLES.

The tenth annual convention of the National Boot & Shoe Manufacturers' Association was held in New York, at the Hotel Astor, January 12-13. In discussing the use of substitutes such as fabric tops and rubber bottoms, it was declared that the purchasers of such shoes were not receiving value equal to that of all-leather footwear and, while the shoe manufacturers benefited by greater consumption, the increasing expenditure for shoes by the general public would latterly affect the manufacturers.

ELECTRICAL MANUFACTURERS TO ORGANIZE.

Representatives of a number of electrical manufacturing companies met last month in the Hotel Biltmore, New York, to discuss the formation of an organization of manufacturers, to deal with the commercial problems of the industry. R. K. Sheppard, of The B. F. Goodrich Co., Akron, Ohio, was chosen chairman of the meeting, and H. R. Sargent, of the General Electric Co., secretary. After some discussion it was resolved to place the matter of organization in the hands of a representative committee of 9, with instructions to report to a general meeting to be called on February 9, to which electrical manufacturers from all over the country would be invited.

The Semple Rubber Co., of Trenton, New Jersey, has adopted the design here shown as a label for use on all its tire tubes, being one of the first of the American rubber manufacturing concerns to make use of the new trade slogan. The Semple company makes inner tubes of two thicknesses, under the trade names Semco and Sedrala.

The Chester Rubber Tire & Tube Co., East Liverpool, Ohio, have made extensive repairs in their plant, which was shut down for several weeks for this purpose. With new machinery, including two new mixing machines, they expect to do a large business during the coming season.

TRADE NEWS NOTES.

Meyer & Brown, crude rubber brokers, of 35-7 South William street, New York, sent out an announcement on January 2 of the renewal of their partnership and their intention to carry on the business as heretofore.

The McGraw Tire & Rubber Co., of East Palestine, Ohio, is offering investors an opportunity to purchase \$500,000 of its 7 per cent. preferred stock. The company's earnings for the fiscal year ending November 30 are reported as \$308,578 in excess of those of 1913, amounting to \$594,136, and its net tangible assets, exclusive of good will, patents, etc., to be worth \$1,353,670. Its authorized capital stock is \$1,000,000.

The Gaulois Tire Corporation, of 49 West Sixty-fourth street, New York, states that shipments of Gaulois tires continue to arrive from Havre and Marseilles, France, as in the past, and that no price advances have been made on account of the war.

The Toledo Rubber Co., of Toledo, Ohio, has moved into new quarters, occupying now an entire large four-story building. This company, which was established 24 years ago, conducts a wholesale and retail business in all kinds of rubber and sporting goods. Its officers are E. C. Deardorff, president, and T. H. Deardorff, vice-president and treasurer.

A lecture on "Rubber from Tree to Tire" was recently delivered at the Seventh Church, Cincinnati, Ohio, by W. G. Brown, of the firm of W. G. Brown & Co., distributors of crude rubber, compounding ingredients, etc., of that city. This lecture was illustrated by moving pictures, 4,000 feet of film being required to show the processes through which the rubber passes from its collection to manufacture into finished goods.

A co-partnership under the name of Arnold & Zeiss has been formed by C. H. Arnold, Albert Zeiss and W. J. Kelly, to take over and carry on, on and after January 1, 1915, the business of the firm of Arnold & Zeiss, whose partnership expired by limitation on December 31. Heilbut, Symons & Co., of London and Liverpool, became at the same time special partners, continuing in the present firm the same financial interest that they had in the former concern.

The B. F. Goodrich Co., of Akron, Ohio, has brought from its factory at Colombes, France, millimeter solid tire molds to be used in the production of tires for army vehicles. The French factory of the Goodrich company is being operated by the Government, but under some disadvantage, about 350 of its former employes having joined the military forces.

Three new 10,000-ton vessels, costing about \$3,000,000, are being built for W. R. Grace & Co., of New York, who do a large business with South American countries, both in import and export lines.

A dinner was held on January 5 at the Hotel Astor, New York, to bring together the men who between 1900 and 1905 were members of the selling staff of the Hartford Rubber Works Co., of Hartford, Connecticut, and to form an organization to perpetuate their friendship. Ernst H. Brandt, Joseph Rental and Harry E. Field were responsible for the idea and the list of persons invited to the dinner contained 51 names.

The Paramount Rubber Co., of Trenton, New Jersey, has appointed The George D. Kramer Co., of New York, distributors in the Eastern States of its line of tennis and hand balls. The Paramount line includes ten varieties of hand balls, but the company has only recently entered the golf ball field, turning out this class of goods for the first time last summer. The process of manufacture is said absolutely to seal the high pressure of compressed air in the ball, leaving no avenue of gradual escape, thus eliminating all possibility of going soft or dead.

TRADE NEWS NOTES.

The Canadian-Connecticut Cotton Mills, Limited, manufacturers of fine Sea Island, Egyptian and Peeler cotton fabrics, have recently placed orders for additional looms and preparatory machinery. O. Butler, secretary-manager of the company, was elected at a recent meeting managing director of the Connecticut Mills Co. at Danielson, and will hereafter be identified with both companies. Mr. Fittz retains his connection as secretary of the Danielson plant. The general agent of this company is R. J. Caldwell, well known to the rubber trade of this country and Canada.

The Knight Tire & Rubber Co., of Canton, Ohio, have engaged Lester I. Rice, formerly with the Republic Rubber Co., to manage their new branch at 215 West Fifty-first street, New York. He will supervise the company's sales in eastern New York, New Jersey and the western section of Connecticut.

The Tire Sales Co., of Buffalo, New York, have a branch at 827 Main street, that city, which will be known as the Motor Tire Supply Co., with A. Greenbaum as proprietor. They will deal, at wholesale and retail, in factory seconds and low-priced guaranteed tires.

The Racine Rubber Co., of Racine, Wisconsin, reports a gratifying result of their last business year, during which they made net earnings sufficient to pay, thirty times over, their preferred dividends, besides a 1½ per cent. cash distribution on their common stock and a 50 per cent. stock dividend in November. They have arranged with the Manufacturers' Supplies Co., Philadelphia, to take over the entire distribution of Racine tires, throughout Pennsylvania, New Jersey and the Southern States. J. A. Winter will be in charge of the sales end, with headquarters at 1336 Race street, Philadelphia.

The Gibney Tire & Rubber Co., Conshohocken, Pennsylvania, have engaged the services, for their Detroit branch, of G. W. Tiffany, formerly with the Goodyear Tire & Rubber Co. in that city.

The Kansas Pure Shoe Law will be on trial as to its constitutionality on February 3, when argument will be heard in the Supreme Court of that State on a motion to advance the case of the Payne Shoe Co. against the attorney-general.

The National India Rubber Co., Bristol, R. I., started its mills on January 4 on full time and the 2,200 employees received the welcome news that sufficient orders were on hand to insure full time for at least six months.

A new tire factory is to be located at New Castle, Pennsylvania. E. N. Ohl, J. S. Rhodes, A. B. Berger and W. H. Schoen, all of Pittsburgh, are interested, and \$260,000 has been subscribed as capital. Large orders have already been given for machinery for the new plant.

The Savage Tire Co., of San Diego, California, recently reorganized its selling department, with H. W. Miller, formerly of the Knight Tire & Rubber Co., as sales manager; Lee Ijams as assistant sales manager, and R. R. Etichus in charge of credits. B. F. Wulff, Jr., has been appointed manager of the distributing branch at San Francisco, which includes in its territory northern California, Oregon, Nevada and the Hawaiian Islands.

At the annual meeting of stockholders of the Chicago Rubber Clothing Co., held at Racine, Wisconsin, on January 23, the following were elected members of the Board of Directors: David G. Janes, George G. Bryant, E. V. Laughton, James Murphy, F. M. Knapp and C. E. Wells. The affairs of the company were reported to be in good condition, and the outlook for 1915 to be most promising. The directors elected the following officers for the ensuing year: D. G. Janes, president; George G. Bryant, secretary and general manager; E. V. Laughton, treasurer.

THE RUBBER CLUB EXPANDS.

One of the busiest offices associated with the rubber trade is that occupied by the Rubber Club of America, at 17 Madison avenue, New York. What with embargo work, the activities of the new divisions and the need of committee meeting rooms, it has been found necessary to add to the office force and to secure additional space.

A NEW PAPER WRAPPING MACHINE.

This machine is for wrapping bales of finished hose, tires or wire. It has a sliding table which is raised and lowered by a hand lever. The bale to be wrapped is placed on the table, which is pushed backward into proper position under the sliding head and then lowered so that it rests on the four revolving cones, automatically operated by a friction drive. This has an adjustable feed for any overlap desired.

A roll of paper is placed between the two sprocket chains and is carried down through the inside of the bale and up around the outside, thereby wrapping the paper strip around it as it is rotated by the cones. When the bale has been completely wrapped, the head is lowered by a hand

wheel, which slackens the sprocket chain so that it can be unhooked. The table is then raised, pulled forward and the bale removed, ready for shipment.

The actual time required to wrap a bale of garden hose 24 inches high with an inch and a half overlap is a minute and a half. One man is capable of running 3 machines, which accomplish as much as 6 men wrapping with burlap in the old way. [Terkelsen & Wennberg, Boston.]

MOTZ TAKEN OVER BY THE GOODYEAR.

The business of the Motz Tire & Rubber Co., of Akron, Ohio, 50 per cent. of whose stock is owned by the Goodyear Tire & Rubber Co., will, after February 1, be conducted as a department of the latter concern.

The Motz company was incorporated in April, 1905, with a capital stock of \$50,000, to manufacture tires. In our issue of

MOTZ CUSHION TIRE.

December, 1913, page 142, a dual tire of the Motz cushion type was shown, and the accompanying cut illustrates the single tire of the same type. These tires have been made for the Motz company in the Goodyear Tire & Rubber Co.'s cushion tire department.

RUBBER CLUB MEETINGS AND MEMBERSHIP.

AT the regular quarterly meeting of the Executive Committee of the Rubber Club of America, held at the Union League Club, New York, January 5, 1915, ten new members were elected, list of whom, with firm representatives, follows:

FIRM MEMBERS.

Acme Rubber Manufacturing Co., Trenton, New Jersey—J. A. Lambert
 Ajax Grieb Rubber Co., Inc., 1796 Broadway, New York—William G. Grieb.
 Bishop Gutta Percha Co., 420 East Twenty-fifth street, New York—Henry D. Reed.
 Braender Rubber & Tire Co., Rutherford, New Jersey—W. P. Braender.
 Combination Rubber Manufacturing Co., Bloomfield, New Jersey—Fred L. Conover.
 Dryden Rubber Co., 1014 South Kildare avenue, Chicago—George B. Dryden.
 Howe Rubber Co., New Brunswick, New Jersey—John J. Tenney, Jr.
 Keystone Rubber Manufacturing Co., Erie, Pennsylvania—J. G. Moomy.
 Mattson Rubber Co., Lodi, New Jersey—J. H. Behrens.
 Western Rubber Co., Goshen, Indiana—G. B. Slate.

ACTIVE MEMBERS.

Myron Henry Clark, United States Rubber Co., 1790 Broadway, New York.
 John Morgan, vice-president and treasurer, McGraw Tire & Rubber Co., East Palestine, Ohio.
 The H. O. Canfield Co., of Bridgeport, Connecticut, authorized the transfer of their active membership to firm membership, with A. H. Canfield as firm representative.
 R. L. Chipman, of 25 Beaver street, New York, authorized the transfer of his active membership to firm membership.
 The B. & R. Rubber Co., of North Brookfield, Massachusetts, have authorized the transfer of their active membership to firm membership, naming T. G. Richards as firm representative.

The following is a list of former members of the Mechanical Rubber Goods Manufacturers' Association who have come into the Rubber Club of America:

Beck, William and Charles, Lawrence, Massachusetts—Alfred Beck, firm representative.
 Bowers Rubber Works, San Francisco.
 C. C. C. Fire Hose & Rubber Co., Boston.
 Cornelius Callahan Co., Boston.
 Continental Rubber Works Co., Erie, Pennsylvania—Theron R. Palmer, firm representative.
 Crescent Insulated Wire & Cable Co., Trenton, New Jersey—C. Edward Murray, firm representative.
 Canadian Rubber Co., Montreal, Quebec.
 Eureka Fire Hose Manufacturing Co., New York.
 Empire Rubber & Tire Co., Trenton, New Jersey—C. Edward Murray, firm representative.
 Gutta Percha & Rubber, Limited, Toronto, Ontario.
 Hewitt Rubber Co., Buffalo, New York—H. H. Hewitt, representative.
 Mechanical Rubber Co., Cleveland, Ohio.
 Niedner's Sons Co., Charles, Malden, Massachusetts.
 New Jersey Car Spring & Rubber Co., Jersey City, New Jersey—John J. Fields, firm representative.
 New York Belting & Packing Co., 91 Chambers street, New York—J. H. Cobb, firm representative.
 Peerless Rubber Manufacturing Co., 16 Warren street, New York—Charles A. Hunter, firm representative.
 United & Globe Rubber Manufacturing Cos., Trenton, New Jersey.
 Voorhees Rubber Manufacturing Co., Jersey City, New Jersey—John J. Voorhees, firm representative.

After the regular meeting a joint session of the Executive Committee and the Embargo Committee was held. Reports of the Embargo Committee's work in Washington were read, special mention being made of the prompt and efficient assistance rendered by the British Ambassador.

A meeting of the Mechanical Rubber Goods Manufacturers' Division of the Rubber Club of America is to be held in New York on Tuesday, February 16, 1915.

ALEMBIC RUBBER.

TWO exceedingly friendly and good-looking young men called at THE INDIA RUBBER WORLD office the other day, by request, with the story of the new "Alembic" rubber that is about to be manufactured in Perth Amboy, New Jersey, by the Alembic Process Co. Whether or not they are one day going to be able

LABORATORY OF ALEMBIC PROCESS CO.

to really produce synthetic rubber in commercial quantities we do not know, but they certainly believe it.

Their story is that 10 years ago a German chemist, familiar with synthetic work at Elberfeld, came to this country and, in the attempt to manufacture synthetic rubber by a process of his own, spent a fortune of something like \$50,000. Incidentally, an explosion in his factory killed his wife, and a later one killed his chief assistant. Not discouraged, he started again to manufacture, this time dispensing with the high pressures that hitherto had proved so disastrous. The result was, so his assistants claim, a gum which looks very much like a fair grade of guayule, which is produced at a cost of 12 cents per pound. There is also

FURNACE ROOM AT PERTH AMBOY.

a by-product which has a ready market in soap manufacture.

The present equipment, which is said to be very simple, allows the production of something like 18 pounds a week. The company has filed a brevet on its process and product and is seeking capital to put in more machinery, so as to be able to turn out from 1,000 to 6,000 pounds a day. The base from which the so-called rubber is made is said to be turpentine.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

OPTIMISM has been restored in local rubber circles now that arrangements have been made for adjustment of English regulations affecting the shipping of rubber. Officials of the Akron rubber companies, including A. H. Marks, general manager of the B. F. Goodrich Co., H. S. Firestone, of the Firestone Tire & Rubber Co., and P. W. Litchfield, of the Goodyear Tire & Rubber Co., in interviews this week, expressed confidence in an early revival of trade. While this city has felt the business depression affecting practically every industrial center of America, during the past six months, conditions are gradually improving and by the first of April will probably be restored to normal. The depression has not had the effect upon Akron that other cities of the same class in this section of the country have experienced and the number of unemployed here is much less than in neighboring cities.

* * *

One hundred salesmen of the boot and shoe department of The B. F. Goodrich Co. attended the first of a series of five winter sales conventions in Akron the second week in January. Social and business sessions covering three days marked the convention.

Frank Kenton, a Goodrich company foreman, and three other employees, sailed January 19 for Paris, France, where they will join the allied armies' crew of tire repair men. It is said that an effort will also be made by Goodrich officials to regain control of the French branch factory of the company which was commandeered by the French government at the beginning of the European war.

Dr. C. E. Smith will be in charge of the department of dental inspection to be opened by this company February 1. Lectures on the importance and care of the teeth and instructions on caring for them will be given by Dr. Smith in all of the departments, in which more than 10,000 men are employed. The Goodrich is the first big industrial institution in this section of the country to establish a dental inspection department.

Diamond tires made a successful addition to their list in "Squeezee," the new non-skid tread Diamond. The tread is made up of three continuous ribs, with cross-bars, and like its namesake, it clings so closely to wet and slippery pavements as to offer sturdy opposition to skidding either forward or sideways.

Plan No. 26 of the Goodrich Company is to have an addition, a permit having recently been granted by the building department of the city for the erection of such a structure, two stories high and costing \$5,000.

The B. F. Goodrich Co. and the Firestone Tire & Rubber Co. are included in the list of Akron industrial concerns which are affected by the increased rates for use of State water. The companies have appealed from the decision of the State Superintendent of Public Works, but after receiving an opinion from Attorney General Turner, Governor F. B. Willis decided that the rate increases were legal and declined to interfere.

The largest check for taxes ever received by the county treasurer of Summit county was received the second week in January from the Goodrich company. It was for \$148,000.

John R. Gammeter and The B. F. Goodrich Co. have lost their right in the Court of Appeals of the District of Columbia for ownership of patent rights on a head placing ring. After four years of litigation the DeLaski & Thropp Co., of Trenton, New Jersey, was awarded the claim. Priority of filing of patent claim was the point involved in the suit.

The Miller Rubber Co., by a two-story, fireproof, brick addition to their plant, have provided for an increase of 1,000 tires in their daily output. A three-story 40 x 110 feet warehouse is being built, also a 50 x 100 extension to the rubber drying room. The additional factory space, including a new shipping depart-

ment built on adjoining property recently purchased, will total 272,905 square feet, or about 6 1/2 acres, and a 2,000 horsepower plant is also being installed for operation purposes.

* * *

Firestone Tire & Rubber Co. converted 12,000 tons, or 24,000,000 pounds, of steel into Firestone rims last year. Contractors estimate 1,000,000 pounds as a liberal allowance for a fairly large building. A working floor space of 150,000 square feet, a force of 400 men and a fine equipment of machinery, including 16 electric welders, find employment in this branch. Firestone rims will be used exclusively this year by sixty automobile manufacturers.

H. S. Firestone, president of the company, in an address before members of the Cleveland Advertising Club, Thursday, January 21, told how rubber trees are grown and cared for and how rubber is transformed from the crude state into the finished product. Stereopticon pictures illustrated the lecture.

Mr. Firestone and other officials of the company attended the factory ball recently given by employees at an Akron dancing academy.

Hanging to a fire escape, four stories above the ground, Jerry Phelps, an Akron man, reached through a window at the Firestone Tire & Rubber Co. plant not long ago, and pulled out more than \$200 worth of auto. tires which he threw to a companion. The men were arrested and bound over to await action of the Grand Jury.

The Goodyear Tire & Rubber Co. recently made public a statement showing the growth of their pneumatic tire production for the past six years. In 1909 they made and sold 102,669 tires, and this number has shown a steady yearly increase, until in 1914 the number of Goodyear tires made and sold was 1,478,396. The demand for the company's pneumatics for heavy motor trucks is likely to further increase these sales. The company is now supplying a 38 x 7 inch tire with a rated carrying capacity of 2,500 pounds, a 42 x 9-inch carrying 4,500 pounds per tire and a 48 x 12-inch of 7,500 pounds carrying capacity per tire. All are of the No-Rim-Cut type and conform to the company's Ideal Detachable Rim, '07 profile. This company last month entertained the selling force of Morley Bros., who handle their goods at Saginaw, Michigan. The party were the company's guests from the 12th to the 16th ult., and were afforded an opportunity to inspect the big plant and attend the school of instruction for Goodyear salesmen.

President F. A. Seiberling, of the Goodyear company, and Mrs. Seiberling are now in London arranging for decorations for their new home on Portage Path, one of the finest in this section of the country. They will return to Akron early in February.

William Upson, former Akron attorney and father of Ralph H. Upson, world champion balloonist, of the Goodyear company, is helping to nurse wounded soldiers in a war hospital at Bagueres de Bigorre, France. He was traveling in France at the beginning of the European war.

According to Jos. Dangel, general factory superintendent of the American Hard Rubber Co., Akron is the only city in the world which boasts a plant successfully manufacturing hard rubber bowling balls. The Akron balls are made entirely of rubber. Mr. Dangel is one of the expert bowlers in this section of the country and it is due to the study he has given the manufacture of the rubber balls that they have been such a success.

Akron rubber companies exhibited at the Ohio Industrial Safety First Exposition at Columbus the second week in January. W. N. Fitch, safety director of the Goodrich, and R. E. Lee, safety director of the Firestone, were among the speakers.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE new year has not yet filled the anticipations of the optimists in the trade. Manufacture has not advanced any considerable extent and there are traces of disappointment in the reports which come from members of the trade. However, there has been an improvement, of greater or less extent, in nearly every branch of the business, and the prospects are for continued advance. The call for mechanicals is quiet; the tire manufacturers are doing a fair business; druggists' soft goods are being called for moderately, and there is some movement in clothing. The weather should help this branch, for rain and snow have been plentiful. In boots and shoes the weather has brought a demand, which had been to some extent provided for. The factories making tennis shoes are busy and adding to their production as fast as help can be secured.

* * *

The tennis shoe question is an interesting one at present. Leather shoes are high, and likely to further advance in price. Shoe dealers in many sections, and especially in the South, anticipate a big call for tennis shoes to take the place of leather shoes, which are or will be too high for certain classes of trade.

* * *

The substitution of rubber for leather in soles grows in importance each month. Sole leather is going abroad for manufacture into shoes for the soldiers, and foreign buyers are willing to pay such prices that American shoe manufacturers find quotations so high that they are turning their attention to substitutes, and most of these substitutes are of rubber, either alone or mixed with fibre, etc. It's a poor month when a new soling of rubber is not exploited in the shoe trade.

One great objection to the use of these soles has been the necessity of stitching with holes rather widely apart, and the use of heavy, coarse thread, so that the rubber will not tear between the holes made by the needle. Such stitching and thread are appropriate only in outing and sporting shoes, and similar lines, and is neither desirable nor practicable for women's fine shoes with high arch insteps and narrow edges. How to overcome this heavy appearance and to give the touch of fine shoemaking without weakening the shoe by cutting the sole at the stitching is a problem which has occupied the minds of several inventors. A Lynn shoe manufacturer, Karl A. Stritter, of Strout & Stritter, claims that his invention will accomplish this. He has applied for a patent, the details of which are not yet fully available, but which are, in effect, a leather welt or reinforcement cemented on, and extending around the edge of the rubber sole in such way that the stitching goes through both rubber and leather, the latter holding the stitches and preventing the splitting of the rubber sole between the needle holes. This gives such protection to the rubber sole that it may be given any desired "edge," and makes it practicable to withstand the strain subjected by high-heeled shoes. If this is really effected, there is almost a certainty of a large increase in the use of rubber soles on women's shoes, for many women would wear these more stylish shapes who will not wear the present low-heel, heavy-edged, rubber-soled shoes. Samples which have been shown in Boston the past month are fully as stylish, slender and shapely as those made with leather soles.

* * *

Frank W. Whitcher, of the F. W. Whitcher Co., manufacturers of the Velvet Rubber Heel and other specialties in rubber, is an ardent champion of fixed prices on advertised articles, and has addressed several conventions and associa-

tions on this important subject. He claims that manufacturers should be allowed to control the prices at which their articles are sold, either by dealers or wholesalers. Until the decision in the Sanatogen case some months ago, manufacturers were so controlling the selling price, but this decision renders such control illegal. There are many hundreds of articles manufactured of rubber which are widely advertised, and on which a standard price has been fixed. But if these articles are sold at cut prices, the manufacturers must either reduce the cost of making or quit advertising, either horn of the dilemma being suicidal. Surely this is a subject worthy of careful consideration, and should be agitated to influence legislation in favor of fixed prices, as a protection to manufacturer, wholesaler and retailer.

THE RUBBER TRADE IN CHICAGO.

By Our Regular Correspondent.

THE first weeks of the year in the rubber trade here have met with the entire satisfaction of the members. Owing to the fact that the month has contained a great deal of bad weather, the rubber clothing houses have been doing a rush business. When the storms arrived the dealers in raincoats and rubber shoes soon ran out of stock and were obliged to replenish from local distributors. These houses were well prepared for the rush, and goods were sent out in expeditious fashion.

Rubber belting houses have not been so busy, of course, as the main rush for them is over until spring. However, there has been a good average demand. Most of these firms carry tires, packing and other mechanical goods, so that when one line is out of season another can take its place. The demand for tire inners has been good, say the mechanical rubber goods men. They also declare that they are receiving orders in fair volume for packing from coal and copper mines in the west and northwest.

* * *

The tire men made great preparations for the annual automobile show, held in the Coliseum and the First Regiment Armory, January 23-30. Some of the firms, of course, have large displays. These are located on the balcony, along with the other supply exhibits. Large crowds are attending the show this year, as the event has been given more than the usual amount of publicity in the newspapers.

* * *

R. H. Abernathy, of the Brazil Rubber Manufacturing Co., 18 South Dearborn street, expresses himself as well pleased with the trend of business for the past month and looks for a good spring season.

* * *

Rubber manufacturers of this city are much interested in the fight which is being made by Chicago manufacturers to secure lower freight rates on carload shipments to the Pacific Coast.

Last week Thomas C. Moore, representing the Merchants' Transportation Bureau, appeared before the Western Classification Committee, which met here, and told the members and a number of railroad officials present exactly what the manufacturers of the city, including the rubber men, wanted in the way of reduced rates.

"Under present conditions," said Mr. Moore, "the manufacturer of a product in New York, Boston, Philadelphia, or any of the other cities on the Atlantic seaboard can actually ship goods by water via the Panama Canal cheaper than the manufacturers of this city can send them to the Pacific Coast by rail. What is more to the point, the steamship companies can make the trip in only a few days' more time. Chicago manufacturers believe that this competition is not fair, and they want a substantial reduction on carload rates to the coast."

The committee refused to touch the matter, however, until they had received some idea of the stand of the Interstate Com-

merce Commission. Railroad men present said that they believed the railroads would not oppose a reduction, but stated that it would not be possible to reduce the trans-continental rates without reducing the inter-mountain rates at the same time. This would bring about serious complications, they said, which would require the attention of the Interstate Commerce Commission.

As a result of this stand Mr. Moore said that the matter would be brought to the attention of the Interstate Commerce Commission at Washington.

* * *

Figures which have been compiled by the newspaper bureau show that rubber goods were handled (in a jobbing way) in Chicago during 1914 to the extent of \$9,675,000, compared with \$12,900,000 for 1913. This is something of a falling off, though some other lines of business show a much greater loss.

* * *

The Canton Rubber & Manufacturing Co., 143 North Dearborn street, have just completed their inventory. They state that the new year has started in in a manner that meets with their entire satisfaction.

* * *

M. S. Curven, of the Boston Belting Co., 172 West Randolph street, said in a recent interview that business has been good and he believes the rubber trade of the West to be in a very healthy condition.

* * *

Business at the Quaker City Rubber Co. has been rushing for the past month or so, shipping packing to the coal mines. There have been few strikes or other labor troubles resulting in the closing down of mines this winter,

which has been a good thing for the mechanical rubber goods houses of Chicago. The vast coal and copper mines within reach of Chicago look to this city as a natural source of supply and, of course, when they close down it means loss of business to local dealers.

A method of attaching vulcanite to aluminum is described in a recent issue of the "Dental Record" that will undoubtedly prove of interest to dentists. It would furnish a means whereby the vulcanite portion of a denture could be permanently attached to an aluminum plate, making an exceptionally light and in every way excellent equipment. The process consists in coating the cleaned aluminum surface with a thin solution of rubber in chloroform. Over this, when dry, is carefully packed a layer of weighted rubber and the further filling of the mold space is completed with ordinary rubber. It is claimed that by this means a stable union between vulcanite and aluminum is effected.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE Trenton rubber manufacturers were not particularly worried over the threatened continuation of the English embargo on crude shipments. For the most part the Trenton plants have abundant supplies either on hand or en route and they would not have been seriously interfered with in the manufacturing end unless the embargo had continued for a considerable length of time. At least one of the Trenton factories was actually benefited by the embargo talk. As soon as the newspapers printed the story of England's ruling on the rubber question this factory received a number of rush orders by telegraph. The customers anticipated their needs for months to come and wanted to make sure that their orders were filled before the supposed raise in price took place.

The accompanying illustration of the new plant of the Essex Rubber Co., at Trenton, tells more graphically than words of the remarkable success of this steadily growing concern.

Less than 7 years ago a small, one-story building was adequate to take care of the company's manufacturing department,

and it also afforded an 8 by 12 office room. A representative of THE INDIA RUBBER WORLD on a recent visit to the plant found a corps of bookkeepers, order clerks, stenographers, etc., busily engaged in an office occupying more space than the combined office and factory contained in the original building.

In the private office of President C. H. Oakley hangs a neat, black frame containing,

PLANT OF THE ESSEX RUBBER CO., TRENTON.

under date of April 29, 1907, the first order the company ever received. Mr. Oakley looks upon this as "the baby of the house" and he cherishes it as tenderly as a father his first-born. It was not until a year after the receipt of this order that the company leased the modest little structure referred to above. A wagon load of coal was obtained from a trustful dealer (who, by the way, still supplies the plant with its fuel) and the fires were lighted in May, 1908. Several mills, a calender and one hydraulic press constituted the original equipment. About \$9,000 worth of rubber goods were sold during the balance of the first year. When it is stated that the sales of the company for the year just closed totaled close to \$1,000,000 one can appreciate with what rapid strides the concern has forged ahead. The profits of the business have been devoted to the upbuilding of the plant.

The new mechanical equipment consists of 1,500 h. p. of Edgemoor water tube boilers, 2 Greene engines of 1,000 h. p., 400 kilowatts of electrical energy for lighting and motive purposes. Eighteen 54-inch mixing mills, 3 calenders, 2 of which are electrically driven, tubing machines and vul-

canizers are required for manufacturing purposes. The company's complete building plans include a three-story brick office building and a reclaiming plant not yet completed.

The company manufactures soles and heels for the shoe trade and claims to produce more rubber soles than any other concern in America. In addition to this important branch of the business, which occupies a most complete vulcanizing press room 60 x 200 feet, the concern makes automobile accessories, sporting goods, asbestos and rubber packing, asbestos brake linings, horseshoe pads, "Soft Spot" heel cushions and all sorts of mechanical and molded goods except belting, hose and tires. Two years ago a hard molded insulating department was formed to make Essex-Condensite, used as an insulating material by makers of electrical appliances and automobiles, in ignition systems and for the covering of automobile steering wheels.

The Essex company operates its own pattern, carpenter and machine shops and employs 400 hands.

The officers are C. H. Oakley, president and general manager; W. F. Bainbridge, vice-president and New England sales manager; Owen Moon, Jr., treasurer; A. E. Moon, secretary and assistant treasurer.

* * *

The Ajax-Grieb Rubber Co. is working 24 hours a day, with three relays of operatives, in an effort to take care of the rapidly increasing demand for Ajax tires. Louis P. Destribats, general manager of the factory, stated to THE INDIA RUBBER WORLD correspondent that even with the great output made possible by this factory arrangement the company will be taxed to take care of its trade.

* * *

John S. Broughton, of the United & Globe Rubber Cos., who recently returned from an extended trip throughout the South and West, reports that the outlook for spring business is gratifying, particularly in the western market.

* * *

The Lambertville Rubber Co. has resumed operations after having been shut down for three weeks for stock taking and repairs. This concern's line of rubber boots and shoes finds a steadily increasing demand throughout the country.

* * *

The Luzerne Rubber Co. has moved into its newly completed building, which affords accommodations for its office department, shipping and inspection rooms. The plant throughout has been practically doubled in capacity and new and up-to-date machinery has been installed. The old steam system of motive power has been replaced by electricity, with individual motors attached to machines.

* * *

Fire, which did damage to the amount of \$1,500,000, wiped out the insulated wire department of the John A. Roebling's Sons Co. at Trenton January 18. The blaze started in a mysterious manner in the shipping department about 7 o'clock in the evening while several hundred men were employed in various parts of the plant.

Owing to the fact that some materials were being manufactured supposedly for use in the French army the rumor gained ground that a German spy had caused the fire. F. W. Roebling, secretary-treasurer of the company, said he gave no credence to the report.

The fire destroyed not only the huge plant in which the insulated wire business of the company was conducted but also a long row of residences, and came alarmingly near spreading through the plant of the Home Rubber Co.

The fire brigade of the Home Rubber Co. remained on duty all night and several incipient blazes along the windows and roof of the plant were put out. An automobile chemical engine was stationed alongside of the Home plant and the flames swept so close that it was necessary to drag it away

with the aid of a locomotive, which serves to illustrate the dangerous position of the company's property.

About 1,000 operatives were thrown out of employment by the destruction of the Roebling plant and many of these suffered the further affliction of losing their homes. In addition to the total loss of many thousands of dollars' worth of

INTERIOR VIEW OF INSULATED WIRE DEPARTMENT.

special machinery, large quantities of finished product were consumed by the flames.

The Roebling wire department was a model in fireproof construction. It had practically a complete inner lining of clinched metal protecting walls and ceilings. The elevator shafts were absolutely "fire proof." Self-closing doors, a supposedly adequate sprinkler system, a well organized shop fire department equipped with chemical carts, hose, extinguishers and other apparatus of the latest design, had rendered the plant theoretically immune from the very element by which it was destroyed.

There was only about \$300,000 insurance on the building and machinery of the Roebling company. F. W. Roebling said after the fire that the company would rebuild at once. No large building will replace the burned one but a number

EXTERIOR VIEW OF INSULATED WIRE DEPARTMENT.

of smaller structures will be erected so that the disaster cannot be so complete should fire again visit the plant. The mayor of Elizabeth, New Jersey, and the president of the Board of Trade of that city visited Trenton after the fire and tried, without success, to induce the Roeblings to locate their insulated wire department in that place.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THERE has been a gradual but on the whole a substantial improvement in the condition of business among the rubber factories in this vicinity during the month. While appreciating the possibilities of the European embargo on rubber, the local manufacturers have continued optimistic and have conducted their plants along conservative lines with hopes of a modification before their stocks of crude material should become exhausted.

There are evidences on all sides of an increased volume of business. The factories making boots and shoes have been favored by the weather conditions so far. Other lines of the industry have also enjoyed encouraging activity, and all anticipate steady employment for some time to come.

* * *

A trial is now being conducted before Judge Arthur L. Brown, in the United States District Court in this city, of Edward P. Metcalf, former president of the suspended Atlantic National Bank, and others, for alleged misapplication of the funds of the bank. At the time the Walpole Tire & Rubber Co. was forced into the hands of a receiver, following the suspension of the Atlantic National Bank, it was stated that the financial difficulties of the bank had entered materially into the embarrassments of the Walpole company. The affairs of the Walpole company have progressed slowly to the point of selling the plant and business, but the date of sale has been repeatedly postponed from time to time, and recently was again set for March 10, at 11:30 a. m.

Business has been rather quiet in some of the departments of the Washburn Wire Co.'s plant at Phillipsdale, and advantage has been taken for overhauling, repairing and general improvements. The waste heat boilers recently installed in the open hearth department are undergoing thorough tests.

Charles R. Remington, general manager of the company, was confined to his home in North Seekonk, Massachusetts, for some time the past month by severe illness.

The factory of the National India Rubber Co., at Bristol, resumed operations on Monday, January 4, with sufficient orders for footwear on the books to give steady work to at least 2,000 employes during the remainder of the winter. During the shut-down the main portion of the plant underwent thorough and extensive repairs, and a fine system of stop levers was installed, under the direction of Vice-President LeBaron C. Colt, to prevent accident to the employes at the calenders and grinders.

One of the most important changes was the removal of all the sewing machines numbering over 300 to a room in the building which was formerly used for a store house. There are also being installed 140 additional sewing machines, which will make a total of 440 in use. When everything is completed the company will employ a larger number of hands and turn out more rubber footwear than ever in its history.

Superintendent James W. Franklin, of the National company was pleasantly remembered Christmas by the employes of the shoe department, when he was given a large and handsome cut glass punch bowl.

*

The plant of the International Rubber Co. at Barrington has been working with double shifts in most of its departments for several weeks, and there are orders enough on hand to keep up the present pace for some time to come.

* * *

Terrence McCarthy is carrying on an active business in the manufacture of tennis shoes and arctics at his factory—formerly the Consumers' Rubber Co. at Bristol. Mr. McCarthy,

who was connected with the former management for a long time and later was receiver of the Consumers' company, is operating his plant to capacity and, it is understood, has orders on his books sufficient to keep it engaged on full time for several weeks to come. The increased activity in the plant has called for an increase of help in the office departments.

The big plant of the American Wringer Co., on Social street, Woonsocket, resumed operations on January 4 after a ten days' shut-down for the purpose of taking the annual account of stock and to make an overhauling and repairing of machinery, boilers, engines, etc. While the plant was closed the boilers were given especial attention. General Manager M. M. Flynn states that the plant has resumed operations with encouraging prospects for steady work for some months to come.

*

The plant of the Davol Rubber Co., on Point street, Providence, has been gradually resuming a full-time schedule in its numerous departments during the past few weeks, so that the entire establishment is now running practically to its capacity. It is reported that the company has recently been in receipt of several large orders for surgical goods which are to be used by the Allies in their field hospitals.

FEDERAL COURT HOLDS STATE TIRE CORE PATENT INVALID.

A DECISION of great importance to manufacturers of detachable tires, and tire core manufacturers, has just been rendered by Judge Dodge of the United States District Court for the District of Massachusetts, in the case of the Goodyear Tire & Rubber Co. vs. the Hood Rubber Co., holding invalid all of the claims of United States patent 865,064, granted September 3, 1907, to Will C. State, and now owned by the Goodyear company.

This patent covers the core shown in the accompanying illustration. It is made with a plurality of segments that abut against each other. It has beaded inner flanges and two rings channeled to fit them. The sections are assembled and bolted firmly together by the rings.

It was asserted by the plaintiff in the suit that the State patent covered all types of cores, used in the manufacture of detachable tires, having substantially non-extensible edges and comprising a plurality of independent sections held in ring formation by one or more rings overlapping the inner portions of the sections.

The court found that, prior to the invention of this core by State, substantially the same construction had been in commercial use at the plant of The B. F. Goodrich Co., of Akron, Ohio, and had also been in general use by the Fisk Rubber Co., of Chicopee Falls, Massachusetts, in the manufacture of detachable tires, having substantially non-extensible edges.

The suit just decided was filed December 5, 1910. Another suit on the same patent brought by the Goodyear Tire & Rubber Co. against the Ajax-Grieb Rubber Co., of Trenton, New Jersey, is now pending in the United States District Court for the District of New Jersey.

A—Core.
B Beaded Flanges.
C Clamping Rings.

The Taunton Rubber Co., Taunton, Massachusetts, has moved into its new factory on East Whitehill street. J. L. Gifford, sales manager, is very optimistic over the future prospects of the business.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

AT no time since the embargo on rubber was instituted have such sanguine views been held as to its early removal. Mincing Lane appears to be convinced that the cancellation of the export prohibition is only a matter of days, or even hours, and plantation rubber has already risen several pence per pound in anticipation. Incidentally, the hard Para market has weakened. It may be that in the existing optimism there is a trace of the wish being father to the thought; but there is in reality a far more potent reason. A few days ago it was unofficially reported that President Wilson had ordained the certification of the exact contents of American cargoes before they leave port. This is the foundation upon which current hopes are based, for it is contended that, if the report be true, the entire question at issue between the two countries will be automatically solved. Obviously such a course would do away with the necessity of searching ships at sea, for it may be assumed that if manifests are declared before sailing the shipping of contraband must cease. It is thought that the British government sought to use the rubber embargo as a lever in the negotiations respecting commerce conditions between the two countries and the view is that it has proved very effective. But, pending confirmation of the report referred to, the market must be content to wait and hope. As has been stated before, the prolongation of the embargo, indefinitely, would give rise to some very serious problems in the plantation industry, not the least of which is the possibility of trouble with the imported Indian labor on the rubber estates.

Meanwhile it must be confessed the importers have taken the situation very philosophically, in which they are supported by the fact that hitherto the market has kept its end up remarkably well in circumstances which might have been calculated to knock the bottom out of it. In this the situation has been helped by the fact that owing to shortage of labor at the docks the landing of rubber cargoes is proceeding very slowly. Thus, although supplies at hand are undoubtedly large, the actual stocks on land do not indicate anything abnormal. Another noteworthy point is that, despite the embargo, there is no sign of diminished production in the Orient. On the contrary, the crop returns for last month show substantial increases all along the line.

RUBBER "ARMOR PLATE" FOR WARSHIPS.

Not only has the war proved the best advertisement that rubber has ever had, but it has been the means of bringing to the fore several interesting inventions in which rubber plays an important part. One of these consists of rubber plates for the protection of battleships against the attack of mine or torpedo. Mr. Louis P. Bowler, the inventor, claims that 4 to 6-inch rubber plates attached to a 1½ inch armored ship will withstand the explosive force of any torpedo or mine in present use. He contends that heavy steel armor plate is useless against the attack of the modern submarine and points to the losses sustained in the present war as proof of his argument. It is common knowledge, in regard to explosives, he observes, that when a ponderous floating mass, such as is presented by a huge battleship, offers solid steel-faced resistance to the explosive shock of the torpedo, something has to go. The hardened steel is a non-absorber of concussion, and its only influence is that of repelling. The effect of this same terrific force directed against a tough, unbreakable, yielding and resilient body such as rubber or gutta-percha is the exhaustion and absorption of the striking

force or concussion. The inventor once witnessed the explosion of 1½ hundredweights of dynamite on a 2-inch rubber flooring, which resulted in everything being blown away except the rubber, which had a scorched surface extending over 4 feet with several holes caused by burning. The tendency of dynamite is to strike downwards, the heat being the most destructive agent where rubber is concerned; but this effect would be considerably reduced in cases of explosion in water.

The idea, briefly outlined, having been brought before the Rubber Growers' Association, that body has made a proposition to the Admiralty to supply, free of cost, the rubber necessary for covering a trawler mine-sweeper. The expense of covering a battleship with rubber plates would, of course, be very great, for it is asserted that the cost of covering a 120-foot mine sweeper would be from £12,000 to £15,000. Nevertheless the cost would not be disproportionate if the device were effective in saving battleship crews, not to mention battleships themselves.

ACTIVITIES OF THE RUBBER GROWERS' ASSOCIATION.

It will be recollected that some months ago the Rubber Growers' Association made representations to the government with a view to supplying the British troops operating in wet trenches with rubber boots. Although their efforts in this direction have not yet been crowned with success, the association has been asked to equip the Royal Flying Corps with rubber boots and is now preparing to comply with the request. Besides the 1,000 hot-water bottles supplied by the association to the British Red Cross Society, large numbers of similar bottles, provided out of the Hospital Flooring Fund, have been distributed among some 45 hospitals throughout the country.

TIRE NOTES.

The failure of the Marshall Jacket Tyre Syndicate, Limited, with assets only sufficient to pay the debenture holders ten shillings on the pound, adds another to the somewhat lengthy list of tire flotations which have grievously disappointed investors in them. The idea of a jacket which is to bear the rough work of the road and keep the real tire in good condition has many supporters, and another company has recently been formed to supply motorists with old covers to be wired on to protect their new tires. The Wood-Milne Co., Limited, is now quite busy with a new band tire, but this does not contain the steel wool which has been a component part of the tires they have been exploiting for some years. The idea of incorporating steel wool in the rubber comes from America and is the property of a company there. The sole British rights were obtained from the inventor by Mr. Roberts of the Wood-Milne Co., Limited, on the basis of a certain payment for each tire made.

It is interesting to note that a number of the tire repairers have been enlisted by the War Office, through the agency of Harvey Frost & Co., of London, and certified by them. The principal work of the men is in connection with the Mechanical Transport Department of the Army Service Corps, though some are engaged with other corps; the pay is 4s. or 5s. per day, all found. It is now announced that men who hold the H. F. mechanics vulcanizing certificate and are also competent drivers are required for enlistment in the military wing of the Royal Flying Corps.

A new British registration which calls for notice is the Firestone Tyre & Rubber Co., Limited, which has a capital of £10,000 in £20 shares, the first directors being H. Hughes, Marshall

Stevens and J. Jordan. The declared object is to carry on the business of manufacturers of and dealers in rubber tires and metal rims for vehicle wheels and rubber goods of all kinds.

The works of the Sirdar Rubber Co., Limited, situated at Bradford-on-Avon, were put up for auction sale by tender as a going concern in December. The company, which had gained considerable success with its Sirdar motor tire, had been for some time in the hands of a liquidator.

THE RUBBER HEEL TRADE.

Attention was drawn to the prevailing depression in this branch by the sale by auction of the effects of the Lancashire Rubber Works, Limited, of Manchester, on December 23. The factory, with unexpired lease, was first offered as a going concern, but as no bid was forthcoming the plant and stock were sold piecemeal, with the exception of the heavy machinery, which was stated to be the property of Messrs. Hampson Brothers, the rubber engineers. For some time the close competition among heel manufacturers has been a source of concern to individual firms and the practical closing of the Continental trade by the war has been a serious matter. Belgium, Austria and Italy have been good customers for cheap heels, and also Germany to some extent. There has been practically no import of these goods from the Continent, and manufacturers have not had much in the way of increased home markets to make up for the loss of foreign business. At the same time some firms announce satisfactory business in home circles, so it is not all gloom. What foreign competition there is comes from America, in the form of a heel described by business competitors as being of a good medium quality.

ELASTIC THREAD.

As so large a part of the English production of this article is usually sent to Germany, France and Scandinavia, it is not surprising that this department of the rubber trade has been severely hit by the war, though considerable compensation has come in the increased demand for surgical equipment, into some of which it enters. Since the introduction of the rubber-cored golf ball the thread manufacturers, though they have no monopoly of the business, have experienced increased demands. At the moment, however, the trade in golf ball elastic, like all rubber expressly intended for sporting and games, is very slack. The rubber thread used for golf balls is, of course, of the band form approximating to electrical tape, rather than the rectangular type used for weaving purposes. With regard to the manufacturers of the latter commodity, there has been no alteration in the number and identity of the few firms engaged, and with one alteration the following list of members of the Rubber Thread Manufacturers' Association of today is identical with that of 30 or 40 years ago. Wm. Warne & Co., Limited, Tottenham, generally supposed to be the largest producers; Charles Macintosh & Co., Limited; David Moseley & Sons, Limited; The New Liverpool Rubber Co., Limited, and W. & A. Bates, Limited. The main objective of the association, which is quite distinct from the India Rubber Manufacturers' Association, is to fix the selling price of the thread for certain periods.

SYNTHETIC RUBBER FIASCO.

The company known as Synthetic Products, Limited, which came out with a flourish in 1912, appears already to have reached its end. The concern was to devote its energies to the production of acetone and fusel oil with synthetic rubber as a sort of side line. As a commercial undertaking the company has been anything but a brilliant success, and now, with funds virtually exhausted, and the government in possession of their synthetic rubber factory, presumably for billeting troops, operations are to be suspended until the end of the war. The report states that in the spring of last year the company was approached by important Continental chemical groups for the formation of an International Synthetic Rubber Alliance and negotiations were still in progress when the

war broke out. It is also stated that "an application has been received from a wealthy manufacturing corporation in the United States, with the object of developing our processes there."

The position as outlined at the annual meeting of the company seems to be that the process does not admit of the production of acetone alone. The manufacture of one part of acetone involves the simultaneous production of two parts of butyl alcohol, one of the higher forms of fusel oil. For acetone there is a certain demand, but butyl alcohol is rather an unknown quantity; whilst it might be possible to sell 50 tons, it is highly problematical whether a market could be found for as much as 1,000 tons. The embarrassing presence of butyl alcohol in such large quantity, however, would not matter so much if only the synthetic rubber process were more advanced, for the former provides the raw material for the latter. The position is, therefore, that acetone cannot be produced without butyl alcohol and the butyl alcohol cannot be utilized because the synthetic rubber process is not sufficiently developed. Even if it were, nothing could be done at present, because the government is in possession of the factory containing the synthetic rubber plant. Something was said by one of the directors at the meeting about "training their special bacteria" to concentrate upon the production of acetone and to let butyl alcohol take care of itself, but whether more will be heard of this seems open to doubt. Shareholders appeared to be more concerned with the fact that some £40,000 has been expended on development and experimental work without any very tangible results. But perhaps the unkindest cut of all was for the board, which includes the name of Sir William Ramsay, to be informed by the government that "they were not a satisfactory body to deal with" in connection with the manufacture of acetone, because they are not the registered owners of the patents under which the company operates.

NON-INFLAMMABLE SOLVENTS.

Carbon tetrachloride was proposed a good many years ago as a solvent for making rubber solution which would not be looked at askance by carrying companies, because it is non-inflammable; and it has been regularly used to a limited extent. Probably its use is on the increase, to judge by recent enquiries in the trade for the sources of supply. Except the special property mentioned, it does not seem to have any advantage over benzol and coal tar naphtha, and its toxic properties form a danger which must be guarded against. Of recent years the position held by carbon tetrachloride has been challenged by various organic chlorine compounds, the suitability of which as solvents for rubber was demonstrated two or three years ago by a professor of chemistry at Berlin, who patented these applications in this respect. The principal drawback to their use has been inability to compete with naphtha as regards price. Quite recently, however, two or three of these bodies, namely, dichlor-ethylene, trichlor-ethylene and tetrachlor-ethane, have been prepared on a large scale by a chemical corporation in England and at a price which closely corresponds to that of benzol. I understand that these liquids are used as solvents for certain resinous bodies. I note in "Rogers' Industrial Organic Chemistry," published in 1912, a note to the effect that the use of the following non-flam solvents for rubber is protected by patent, viz., carbon-tetrachloride, dichlor-methane, trichlor-ethane and tetrachlor-ethane. In English patent No. 22,704, October 8, 1913, the use of trichlor-ethylene as a rubber solvent is protected, so it would seem that as the production of these various chlorine compounds is developed somebody patents their use with rubber. I have experimented with some of these bodies of rather formidable name and find that they are certainly good solvents, but I should think that

their vapors, though non-inflammable, would prove to be more trying to those inhaling them than in the case with benzol. Further information on this point is a matter of some technical importance.

In the meanwhile I may mention that at a recent inquest in London on a workman employed at the air craft factory, Hendon, the home office expert said that the man had been working with a very quick-drying varnish consisting partly of tetrachlor-ethane which had caused disease of the liver. This was the first case of the kind reported and it was stated that the management of the factory would take special precautions in the future.

With regard to the business done in non-flam solvent in the last few years a prominent use has been in the making up or repair outfits for cyclists, the rubber works buying the solvent from the rubber chemical dealers under the name of non-flam solvent and not under its specific chemical name. In most cases the solvent was carbon tetrachloride, the price being about double that of benzol.

THE PATENT LIST

The French patent No. 468,493 of W. E. Muntz is concerned with the idea of protecting the fabric of rubber-coated materials from the action of sulphurous and sulphuric acids produced by oxidation of the sulphur in the rubber. This is to be done by treating the fabric previously with a 3 per cent. solution of barium hydrate under reduced pressure, allowing it to drain and then immersing in a 3 per cent. solution of ammonium carbonate and allowing to dry at the ordinary temperature. Presumably by this procedure we get a finely divided precipitate of barium carbonate on the cloth, which, under the action of sulphuric acid, will form barium sulphate. Theoretically this seems all right, but the point arises whether any precaution of the sort is necessary. I don't remember having come across any cases where the acid produced from the sulphur in the rubber has rotted the fabric, though it is supposed to exert a baneful influence upon the rubber. In order to prevent this treatment an alkali solution is often applied to single texture goods, though more often in the case of cold cure than dry heat cured goods.

Patent No. 11,125, of 1914, granted to Arthur Nixon, of Manchester, relates to a specified mixing of approximate proportions of ingredients for making solid rubber tires. This seems somewhat of a new departure for a patent, as none of the ingredients are novel and it would be extremely difficult to say that similar formulas have not been used by others. It would seem to be a case where it would be very difficult to prove infringement and at the same time it puts the patented man in a position to block enterprise in the constant change which is taking place in factories with the object of improving or cheapening mixings. Of course the usual procedure in a rubber works is to evolve a satisfactory formula and to keep it as far as possible a secret. Unless a new process of manufacture is involved it has not been customary to seek patent protection. The present patent may or may not refer to an exceptionally good formula on this point but it is important to know that it is patentable seems to be a matter fraught with considerable importance to the trade generally, in view of possible developments.

Exhibitors have explored the floor installed in the Nigeria and British Guiana Courts in the Public Exhibition Galleries at the Royal Institute in London, and, of them, consisting of rubber and rubber goods, as well as of other materials, but it is not clear what are the reasons for finding a market in these countries. The new exhibitors of the Nigeria Court include rubber and oil-palm products, native leather and materials used in dyeing it, ground nuts, ostrich feathers, and Nigerian wild silk. The exhibitors of the British Guiana Court, the

additions include rubber, cane sugar, rum, rice, cocoa, coffee, starch, arrow root and an interesting assortment of native woods.

THE ENGLEBERT FACTORY NOT OPERATING.

Letters from Englebert Bros. & Co., of Liege, Belgium, written January 6 and 12, deny the rumor mentioned in our issue of December—page 120—to the effect that their factory was being operated in the manufacture of tires for the German army. They state that their plant has been closed since August 4. Upon the occupation of Liege by the Germans the manufactured stores of the Englebert company were requisitioned and sentries were placed on guard to prevent tires being brought out for other than German needs, but the factory has not been in operation, except for a very brief period, when 20 workmen were allowed to complete an order for joints, valves and other technical goods for certain of the Englebert customers. It is supposed that the rumor may have been caused by the fact that one of the furnaces in the plant has been kept running to heat the offices, where accountants are at work, and that smoke has been seen issuing from the chimney.

ITALY'S RUBBER COMMERCE.

The extent to which the movement of rubber in the world's markets has been affected by the war, is revealed in recent tables of imports and exports, published by the Department of Commerce and Labor of the United States. In the foreign trade of Italy, for instance, the falling off is startling. For six months ending July, 1914, Italy imported from the United Kingdom, manufacturers of rubber and elastic, valued at \$515,000; in July, 1914, goods of the same character to the value of \$68,000; in August of that year \$50,000, and in September \$8,000. From Germany, Italy's imports of manufactures of rubber and elastic were, for six months to July 31, 1914, \$2,210,000; July, 1914, \$223,000; August, 1914, \$110,000; September, 1914, \$21,000. From France, during the six months to July 31, Italy imported manufactures of rubber and elastic to the value of \$1,163,000. For July, 1914, these imports amounted to \$102,000, for August, 1914, they had declined to \$54,000, and in September, 1914, they amounted to \$18,000. The export returns show a similar state of affairs: For six months, April to September, 1913, Calcutta exported raw rubber to the value of \$15,943; for the same period in 1914 the value of the exports was \$4,573.

The exports of rubber from French West Africa to Italy, amounting in value in 1912 to \$8,346,380, dropped to \$2,942,822 in 1913. Nigeria showed a similar decline from \$608,227 worth of rubber in 1912 to \$437,826 in 1913. In other lines, both raw and partly manufactured goods, the falling off has been equally severe.

INTERNATIONAL CONGRESS OF CHEMISTRY AT PETROGRAD.

A list of members of the Bureau of the Sections and Sub-sections of the Ninth International Congress of Applied Chemistry, to be held at Petrograd, Russia, August 8-14 of the present year, is contained in the preliminary announcement of that meeting. Section V-b—India Rubber and Other Plastics—is in charge of the following officers: President, B. Bysoff, of the Russo-American India Rubber Co.; vice-president, L. Muschus; secretary, B. Tiedemann, of the Technical School of Chemistry of Petrograd. Communications concerning this Congress should be addressed to the honorary secretary, W. N. Ivanow, 8 Winter Palace Place, Petrograd.

Now that the rubber tires used by the London omnibuses, of which 75 per cent. were formerly made in Germany, must of necessity be made by British firms, it has been suggested that there is no reason why this trade should not be kept permanently at home.

GERMAN RESTRICTIONS ON SALE OF TIRES.

Sale or other disposition of every sort of tire fit for passenger and other vehicles, and for motorcycles, is prohibited in Germany, this prohibition including old tires and those containing flaws. Dealers are forbidden the distribution of such goods, and rubber factories the filling of orders, even those placed previous to the enactment of this rule. Permits are obtainable from the authorities for the distribution of repaired or imperfect tires incapable of repair by the makers, this only in cases where the maintenance of a public vehicle service, a commercial undertaking or a medical practice is involved and would be rendered impracticable without rubber tires. Applications for such permits must be made under local police certification to the department of inspection for military, air and power vehicles, and must indicate the nature of the vehicle, the number of such vehicles, tires and tubes in the possession of the applicant, the number of tires requiring to be changed, etc., and in some localities the vehicle to be re-tired must be submitted to the bureau of inspection or to the military authorities.

RUBBER DISHES FOR GERMAN SOLDIERS.

Another rubber article has been added to the list already taxing the restricted supply of rubber in Germany. It is a rubber wash-basin, which is being manufactured in large quantities and finds its way to the front in the form of gifts from relatives.

This new type of wash-basin, folding into small space and adding little weight to the soldier's outfit, has been found exceedingly practical. It has proved such a success that the manufacture of plates, cups and saucers made of rubber-lined cloth is being considered, because of the saving in weight. At first it was objected that food served in such dishes would taste of rubber, but experiments proved that this could be avoided. A more serious problem, however, is the durability of such dishes, for they show a tendency to peel and crack; but this difficulty can probably be overcome.

According to an announcement in the "Frankfurter Zeitung" of November 23, German manufacturers of waterproofs have notified their customers of a rise in price of 20 per cent. in the case of rubber coats and 10 per cent. for coats of waterproofed material.

COTTON IN DEMAND.

Cotton in Germany is quoted at a price a little over 20 cents a pound, and it is reported that 2,000,000 bales will be required in that country in 1915. The American ambassador in Berlin says the question is not how much does Germany want, but how much can the United States engage to supply. Austria wants 800,000 bales; Italy, for which formerly 700,000 bales have sufficed, is now prepared to take 1,000,000 bales. As cotton is not contraband, and Great Britain, France, Germany and Austro-Hungary have given formal assurance that it will be so regarded, the principal thing is to secure a sufficient number of neutral vessels to transport it.

By order of the Imperial Chancellor of Germany the export or re-export of cables of all kinds has been forbidden from December 18.

During the fighting at Stenbach, Alsace, the rubber goods plant of J. Rollin was totally destroyed.

German chemists have been stimulated by the shortage of rubber, due to the war, to devote special attention to the production of a synthetic substitute for the natural article. The manufacture of reclaimed rubber has attained a high degree of perfection in Germany and every available scrap of rubber is turned to practical account.

RUBBER NOTES FROM CHINA AND JAPAN.

By Our Regular Correspondent.

THE state of war in Europe, but more particularly the embargo laid by Great Britain on the exportation of india rubber from her colonies in the Malay Peninsula, has seriously affected the rubber industry in China and Japan.

CHINA'S IMPORTS OF RUBBER

According to the latest available statistics, China's imports of crude rubber and manufactures of rubber were as follows:

CRUDE RUBBER AND GUTTA PERCHA

From.	1911.		1912.	
	Pounds.	Value.	Pounds.	Value.
Hong Kong	2,400	\$1,048.58	2,400	\$1,015.28
Singapore, Straits, etc.....	133	104.34
Great Britain	16,533	6,400.26	5,600	1,998.74
Germany	13,600	3,952.34	8,600	2,306.58
Belgium	1,333	187.96
France	666	229.40
Austria-Hungary	1,866	627.52
Japan	3,733	1,542.90	19,191	6,671.84
United States	4,392	1,053.76

Gross imports from foreign countries	44,523	\$15,042.72	35,990	\$12,096.78
Re-exported	133	44.40
Net imports	44,523	\$15,042.72	35,857	\$12,052.38

MANUFACTURED RUBBER (INCLUDING BOOTS AND SHOES).

From.	1911.		1912.	
	Pounds.	Value.	Pounds.	Value.
Hong Kong	\$24,897.30	\$13,489.46
Macao	1,309.06	701.52
Singapore, Straits, etc.....	313.76	90.28
British India	241.24
Great Britain	56,592.24	13,634.50
Germany	23,473.54	14,015.60
Netherlands	1,537.72	19.98
Belgium	309.32	3,941.24
France	16,523.46	9,735.44
Italy	102.86	37.74
Austria-Hungary	3,026.60	930.92
Russia and Siberia—by land frontier.....	32,473.42	69,164.84
Russia and Siberia—by Pacific ports.....	36,163.06	18,366.88
Korea	55.50	7.32
Japan	58,403.76	17,675.64
Canada	11.84
United States	8,808.96	6,052.46

Total imports from foreign countries.....	\$264,243.64	\$167,863.82
Re-exported	14,806.22	9,123.46
Net imports	\$249,437.42	\$158,740.36

In connection with the falling off in 1912 it may be noted that during that year, the civil war, attendant on the establishment of the Chinese republic, affected commerce and industries of the country and the year's imports decreased in consequence.

DEMAND FOR RUBBER GOODS IN SHANGHAI.

Imports of rubber goods at Shanghai for 1913 were reported by the Japanese consulate as follows:

From.	Value.
Japan	\$2,618.86
Germany	8,269.50
Austria-Hungary	451.40
Great Britain	14,307.90
France	47.36
Russia	23.68
Belgium	61.42
United States	12,022.04
Total	\$37,802.16

Regarding the jinrikisha and the rubber tire trade in China, referred to in previous correspondence, I may supplement the following:

There is a present demand for pneumatic tires for the foboche not only in Shanghai, but in Sotow, Nanking and Tinja, where, following the example set by Shanghai, the old style iron tires on jinrikishas are being replaced with rubber pneumatics. The annual demand for rubber tires and tubes for foboche and jinrikishas should surely reach \$600,000 in the near future.

The future demand being so promising, the question is how the trade in pneumatic tires, with the merchant or consumer, can be established. Being on the ground, the Dunlop Rubber Co. (Far East), Limited, and the Michelin Rubber Co., Limited, hold a good position, have a goodly number of customers and will make every effort to develop their trade. It should, however, not be difficult to introduce new lines, under better conditions as to prices and terms, especially in regard to the durability and guarantee.

Suitable conditions would be the following:

Quality.—The quality must be insured by an eight or ten months' guarantee of durability, tires being stamped or numbered to facilitate guarantee records.

Price.—A fair price for a rubber pneumatic tire (2 x 36) would be 11 H. K. taels (\$8.14) per pair, f. o. b. Shanghai; for tubes, 4 to 4½ taels (\$2.96 to \$3.33), f. o. b. Shanghai. Should a rubber tire guaranteed for eight months fail or become useless in the sixth month, the dealer shall refund one-fourth of the full price, or exchange the damaged tires for a new pair on payment of one-fourth of the original price. On failure of the tire during any other part of the guaranteed term, the dealer to estimate the allowance according to the above proportion.

The import tariff on rubber tires is 5 per cent. ad valorem.

THE CRUDE RUBBER MARKET IN JAPAN.

The sudden cessation of crude rubber shipments from Singapore and British India on October 21, 1914, as a result of the embargo laid on these exports by the British government, resulted in a rise of about 75 per cent. in the price of crude rubber in Japan, compared with the July quotation, and a gradual slight increase in old rubber prices. The embargo imposes great hardships on the Japanese rubber industry and if continued for another month will result in the closing of some establishments, the smaller concerns carrying but small stocks of raw material. As a rule they use plantation rubber, which is cheaper than other grades.

As a result of representations made by Singapore to the Colonial Office in London, the embargo was removed on shipments of gutta-percha and jelutong to Japan. An appeal was made directly to the Colonial Office in London, and the Dunlop Rubber Co. (Far East), Limited, were allowed to export 50 tons monthly from Singapore and Colombo to Kobe, Japan, where their branch works are located. As a result of the efforts of Viscount Inoue, Japanese ambassador to Great Britain, the exportation from Singapore of crude rubber produced on plantations owned by Japanese was allowed, but the quantity is small and does not go far to meet the demands of Japanese manufacturers.

The Japanese consul at Batavia informed the Japanese government on November 28 that shipments of crude rubber were being made from there to the United States and that Japan could buy in that market. Nevertheless, the price of crude rubber in Japan remains high, and manufacturers being short of stock, prices are raised to consumers and are now sometimes twice the July quotations, or even more, so that it is difficult to frame a list of the domestic prices of crude rubber. According to a despatch from the consul of Japan at Colombo, Ceylon, the government of Ceylon held out hopes of a removal of the embargo as far as Ceylon is concerned, if he was informed of the names and output of the Japanese manufacturers interested. This would result

in a material reduction in prices in Japan, but they will not reach a normal level until the embargo on exports from Singapore and Ceylon is removed.

Crude rubber imports, from August to November, 1913 and 1914, were as follows:

	1914.		1913.	
	Pounds.	Value.	Pounds.	Value.
August	109,480	\$52,605	158,877	\$113,849
September	261,476	110,301	200,881	112,791
October	322,318	129,660	254,946	134,544
November	Not known	47,272	229,569	104,570
.....		\$339,838	844,273	\$465,754

Quantities and values from January 1 to October 31, 1913 and 1914:

	1914.		1913.	
Source.	Pounds.	Value.	Pounds.	Value.
British India	343,264	\$190,013	263,758	\$192,806
Straits Settlements...	1,480,686	621,181	1,312,517	750,439
Dutch Indies	8,554	1,446	13,928	8,908
Great Britain	202,314	144,288	405,818	380,595
United States	11,054	7,509	138,932	99,551
Other countries	2,582	1,796	84,484	79,685
	2,048,454	\$966,233	2,219,437	\$1,511,984

In explanation of the above statistics it may be stated that the imports for October, 1914, were very large, foreign bills of exchange were beginning to draw and large orders for crude rubber were given. The imports for August and September were in most part from ships that had taken refuge in neutral ports from German cruisers. The imports for November, 1914, show a heavy falling off, the embargo on exports from British colonies having just come into force.

JAPANESE EMBARGO ON ACETIC ACID.

Since the commencement of the war, the Japanese government has placed an embargo on exports of various drugs, medical and chemical supplies, etc.; among the rest, on acetic acid, which planters in the Far East use to coagulate latex. With Germany and Japan, two of the chief sources of the acid, out of the market, planters will have to find some more readily obtainable coagulant, or one of home manufacture. The subject is already receiving considerable attention in Ceylon and other rubber planting centers.

RUBBER GOODS IN SIAM.

Rubber goods imports into Siam for the fiscal year ending March 31, 1914, totaled 159,115 pounds, valued at \$119,507.

The imports consisted of 43,115 pounds of motor-car tires, value \$48,073; 10,816 pounds of cycle tires, value \$12,926; 38,691 pounds of carriage and jinrikisha tires, value \$18,988, and 66,506 pounds of other rubber goods manufactures, value \$39,520.

Of the total rubber goods imports for the fiscal year 1913-14, the United Kingdom and dependencies furnished \$105,193 worth; Germany, \$12,492; France, \$198; Japan, \$468; United States, \$741; all other countries, \$415 worth.

The United States, although furnishing only a small share of the rubber goods imports, during last year supplied 76 motor cars to Siam, against 114 cars from all other countries, so it is expected that in the import of automobile tires, at least, a decided advance will be made during the current year.

The import duty on rubber goods is 3 per cent. ad valorem.

Robert Sandison, at one time on the staff of the English branch of the Continental Tyre Co., has taken over the management of the Columb Tyre Co. (Far East). He is a director of the Columb company in Java, which has the selling rights of Prowodnik tires in the Dutch East Indies, and also has charge of Prowodnik distribution in China and Japan.

Some Rubber Planting Notes.

F. M. S. DECEMBER EXPORTS ESTABLISH A NEW RECORD.

ACCORDING to information cabled by the Government to the Malay States Information Agency, the exports of plantation rubber from the Federated Malay States for the month of December amounted to 3,361 tons, as compared with 2,889 tons in November, and 2,616 tons in the corresponding month of 1913.

Appended are the comparative statistics for 1912, 1913 and 1914:

	1912.	1913.	1914.
January.....tons	1,218	2,131	2,542
February	1,212	1,757	2,304
March	1,379	1,737	2,418
April	1,020	1,626	2,151
May	1,007	1,225	2,069
June	1,029	2,005	2,306
July	1,204	1,781	2,971
August	1,633	2,363	1,850
September	1,326	2,000	2,879
October	1,435	2,160	2,897
November	1,394	2,062	2,889
December	1,649	2,616	3,361
Total	15,506	23,463	30,697

It will be seen that the figures for December establish a new record for one month's export, while the total for the year, the biggest yet recorded by the Federated Malay States, shows an increase of 7,234 tons over last year's record. It is interesting, for the sake of comparison, to give the aggregate export of plantation rubber from the Malay States for the past six years: 1909, 2,641 tons; 1910, 5,452 tons; 1911, 8,792 tons; 1912, 15,506 tons; 1913, 23,463 tons; 1914, 30,697 tons.

WHY PUBLIC SALES?

The alleged benefits of public rubber sales have lately been discussed in the columns of "Tropical Life." It is remarked that "public sales are still withheld, but there is no reason why any should take place. What sells, sells easily, and those qualities which do not attract the large buyers are not likely to do any better if dragged before the limelight of the public sales."

Planters are urged to send to the market what buyers want and not merely what they are able to turn out. Standard qualities of a good and reliable character are wanted, but they must be such as to command a ready sale at a good profit. Public sales are time-honored institutions, but there are other methods of selling—notably the inscription system.

BURMA PLANTERS SEEK GOVERNMENT ASSISTANCE.

A recent issue of the "Malay Mail" reported an appeal on the part of the Lower Burma Planters' Association to the lieutenant-governor, in which the local government is requested to afford temporary financial assistance to planters in that section. The absence of foreign shipments of rubber since the war began, the small local demand in the Eastern markets of Singapore and Colombo and the difficulty in obtaining loans from local or home banks, together with the fact that in many instances loans have been called, has resulted in serious difficulties for the planters. Unless some such step is taken a point must soon be reached at which coolies will have to be discharged and cultivation suspended, and such a shutting down would entail the disorganization of the official staff and scattering of the labor force. It is suggested that the government advance or guarantee a monthly payment, the amount to be determined, after enquiry by the deputy commissioner or other government official.

RUBBER EXPORTS OF SEYCHELLES ISLANDS.

According to a British return, the following have been the shipments of Seychelles rubber, all of which has gone to the United Kingdom: 1912, 677 pounds, value \$750; 1913, 1,768 pounds, value \$1,390.

NEW RUBBER MARKET AT BATAVIA

The Consul General of the Netherlands at New York, A Van de Sande Bakhuyzen, advises us, under date January 19, of the receipt of information by cable from the Chamber of Commerce at Batavia that a rubber market will be established in Batavia, Netherland East Indies.

STATISTICS OF NETHERLAND INDIES.

Official statistics show that in June, 1914, there were in the Netherland Indies 555 separate rubber undertakings, as compared with 548 in June, 1913. Of these undertakings 332 at the earlier date were in Java, 216 in other possessions; at the later date 344 in Java and 211 in other possessions.

The planted area had increased from 442,192 acres in 1913 to 511,682 in 1914, although in Java there was a slight restriction from 217,692 to 213,507 acres.

About 90 per cent. of the total planted area was under *Hevea*, the remainder under *Ficus*. Rubber alone was planted in about half of the acreage, while the remainder was in mixed cultures.

RAIN IN JAVA.

Considerable anxiety has been felt in Java by reason of the drought which has prevailed in that island since the middle of June. According to recent advices, the dry spell has ceased, much to the relief of those engaged in the local planting industry.

LATEX COAGULATION IN CEYLON.

The shortage of acetic acid, used as a coagulant for rubber latex in Ceylon, now that the supply from Germany is cut off, has led to various suggestions as to substitutes for the product. The manufacture of the acid locally, by the destructive distillation of woods, of which it is claimed that there is a good supply in Ceylon, is urged particularly, the residual product being a grade of charcoal that would find a ready market as fuel. Dry coconut shell can also be used for the same purpose, the dry distillation of 10 pounds of shell yielding about ½ pound of tar and 2½ to 3 pounds of crude pyroigneous acid, containing about 12 per cent. of acetic acid. *Withanica Coagulans*, a plant that grows wild in Ceylon, is also proposed as a coagulant for rubber.

Experiments have also been conducted in the coagulation of latex by means of toddy vinegar, but the most promising results are claimed for the fluid obtained from fresh coconuts, when broken for copra. This fluid, left to ferment for a few days, becomes sufficiently acid to effect the desired coagulation and the process is claimed to furnish a better product than acetic acid. Experiments are being made with other coagulants some of which are impracticable, while others promise to furnish a utilizable substitute for acetic acid. Sulphuric acid in dilution is also suggested as a coagulant, and the "Planters' Chronicle," Bangalore, discusses at length its use for this purpose.

One process of coagulation consists in exposing the latex in shallow trays to the smoke in smoke houses, a thin layer being added each day to that already coagulated, until in a week or two a fairly thick slab is produced. Layers of latex two inches in depth are found to coagulate completely within 24 hours.

The Indian Commercial Intelligence Department is making preparations to assist Indian manufacturers in the production of goods hitherto imported from Germany and Austria. For this purpose, suitable leaflets will be circulated among Indian manufacturers, describing these articles and showing the value of the trade they represent. Exhibitions, showing samples of the imported goods and of similar articles made in India, are to be opened in Bombay, Madras and Calcutta.

PLANTING NOTES.

The rubber planting companies in the Far East report a heavy depletion of their home official forces as a result of the war. A large percentage of the staff of the leading companies is either on active service at the front or otherwise engaged in affairs connected with the war. Some of the offices of the leading estates have been thus almost completely demoralized.

The directors of the Straits Plantations, Limited, in their fifteenth annual report submitted at their recent meeting, gave the crop of rubber for the year 1913-14 as 50,485 pounds, compared with 49,129 pounds for the preceding year. The cost was 1s. 7.71d. per pound, f. o. b. Teluk Anson, against 1s. 8.12d. per pound the previous year, and the average net price realized was 1s. 10.37d. For the year 1914-15 a crop of 43,000 pounds is estimated.

At the fifth ordinary general meeting of the Good Hope (Selangor) Rubber Co., a proposition was submitted to convert the corporation into a London sterling company. A favorable report on the condition of the company's properties was made by Mr. Kelway Bamber, who had recently returned from a visit to the estates, and the report and accounts were adopted as presented.

The Seaport Estate, according to a report presented by its directors at the recent annual meeting held in London, harvested last year a crop of 244,500 pounds of rubber, against 240,000 pounds, estimated, the previous year's yield having been 198,494 pounds. The total cost of production, including London expenses and all charges, was 1s. 5.12d. per pound, compared with 1s. 11.38d. per pound last year. The year's net profit amounted to £11,662 14s. 4d., to which must be added £6,873 14s. 10d. carried forward, making £18,536 9s. 2d., from which the payment of a dividend of 6 per cent. was recommended, leaving £7,286 9s. 2d. to carry to next year's account. For the year ending June 30, 1915, a rubber crop of 270,000 pounds is expected by the manager. Several additions were made to the buildings on the estate, including an assistants' bungalow, a smoke house, three sets of permanent coolie lines and an extension to the factory, in which a second engine and a washing mill were installed.

The Golden Hope Rubber Estate, Limited, announces the declaration of a 5 per cent. dividend on the paid-up capital.

At the eighth annual general meeting of the Sungkai-Chumur Estates, Limited, the chairman announced net profits of £18,004 which, with £6,391 brought forward from last year, gave them £24,396 to dispose of. From this it was proposed to pay a final dividend of 10 per cent., making with 2 interim dividends 30 per cent. for the year. After transferring £6,000 to development account, making a total of £10,496 for working capital, the sum of £5,396 would be left to carry forward. The total production for the year was 347,621 pounds, 3,621 pounds more than last year, at a cost of 1s. 3.71d., compared with 1s. 9.76d. for last year, a reduction of more than 6d. per pound. The gross average price realized was 2s. 3.25d., compared with 3s. 8.79d. the previous year. The average acreage tapped was 868 out of 1,469 planted, the yield per acre 388 pounds, against 340 pounds last year, and the yield per tree 3.20 pounds, compared with 2.72 pounds last year. For the current year a production of 350,000 pounds is estimated.

The proposed shipment of latex from the plantations in the Far East to London, for conversion into rubber, in connection with which English capitalists are rumored to have secured a patent, is the subject of comment in "Times of Ceylon," which claims to recognize in the proposition a move in the direction of standardization which would be promoted by the collection of large quantities of the material from various sources, for treatment in one large central plant. We still fail to comprehend what advantage would be gained by sending the latex to London, where it could be just as well treated in Ceylon, and the rubber would be a much safer and more convenient article to ship than the latex.

REVISED DUTY ON RUBBER EXPORTED FROM THE MALAY STATES.

FOR some time past the rubber growers of the Federated Malay States have been seriously dissatisfied with the effects on their business, especially on the profit side, of the export duty on rubber and the rentals paid on land occupied for plantation purposes.

As a result of correspondence and negotiations between the Council of the Rubber Growers' Association in London, the British Colonial office and the government of the Federated Malay States, the latter body, with the approval of the Secretary of State for the colonies, has sanctioned a revised scale of duty and certain modifications in rental.

The revised scale of duty, recommended by the High Commissioner for the Malay States as the result of a meeting held by him with the Acting Chief Secretary at Kuala Lumpur, at which the unofficial members of the Federal Council residing there and residents of Selangor and Negri Sembilan were present, is as follows:

No export duty shall be levied on rubber when the value of first grade plantation rubber in London is less than 1s. 6d. per pound; when the value is 1s. 6d., and not more than 2s., a sliding scale is provided for the regulation of the duty, and when the price rises to more than 2s., the duty is to be 2½ per cent., as at present; the duty is to be calculated on the value of first-grade rubber and no allowance is to be made for inferior grades.

As regards rentals, at the Estates' option, the enhancement of rent should be modified to be 50 cents from the seventh to the tenth year, inclusive; \$1 from the eleventh to the fifteenth year, \$2 from the sixteenth to the twentieth, and \$3 from the twenty-first year. These modifications are accompanied by a more stringent cultivation clause, calling for the cultivation of 5 per cent. of the area annually for 5 years, a further 25 per cent. from sixth to tenth year, inclusive, and from the eleventh to the fifteenth year an additional 25 per cent.

These recommendations having been approved by the British Colonial Secretary, the High Commissioner was so informed.

The Council of the Rubber Growers' Association does not consider the modification either satisfactory or final, and on the cessation of hostilities will again take up the question with the Colonial Secretary and the government of the Federated Malay States.

RUBBER IN ZANZIBAR AND PEMBA.

Zanzibar has an area of 400,000 acres, with a population of 114,000, and Pemba 245,000 acres, with about 85,000 inhabitants. There are two rubber-producing plants indigenous to Zanzibar, the *Landolphia Kirkii* and the *Muscarenhasia elastica*; the rubber exported being almost entirely obtained from the former. The exports of rubber from 1909 to 1913 were as follows: 1909, 2,740 pounds; 1910, 4,124 pounds; 1911, 4,285 pounds; 1912, 3,588 pounds; 1913, 2,220 pounds.

Ceara rubber trees were largely planted in 1907 in the north of Pemba, but owing to difficulties of labor and transportation their cultivation was discontinued.

INCREASED COCHIN CHINA YIELDS DURING DRY SEASON.

Reports from Cochin China state that the yield of rubber during the dry season, instead of being less than in the rainy period, as in many other countries, is as much as 50 per cent. greater. The Annamite laborers are remarkably dexterous, the average number of trees tapped daily being 600 for men and 450 for women. The method used gives a constant flow of latex, with a minimum amount of bark removed.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

NOTES FROM DUTCH GUIANA.

By Our Regular Correspondent.

THE revenue of the colony for the year 1914 was much less than that of the previous financial year. This falling off was due to a partial failure of the balata industry consequent upon the European war and a corresponding depression in trade generally. The year can hardly be recorded as having been a prosperous one. Apart from the war, from the effect of which the peasant proprietors and laboring classes suffered considerably, there was also a large increase in the price of imported foodstuffs from the United States, which advanced the cost of living. There does not appear to be much hope of these high prices abating, and the result will probably be, as far as this colony is concerned, that the consumption of many articles will gradually be discontinued in favor of local products, while the war lasts.

Thirty motor carts were imported during last year, twenty-five of which came from the United States, the trade with which country has in the past few years shown a steady increase.

Owners of rubber plantations have every reason to be satisfied with the results of the past year. The harvests of 1914 were exceedingly good. The prices were not as satisfactory as might have been expected, but the planters have not yet begun to produce rubber in sufficient quantities to have big turnovers. When the prices advance they will all come in for big profits, for then large quantities will be regularly shipped to Europe and the United States. We think the waiting game of the planters a very sensible one. The by-products, however, proved highly remunerative, and dealers, in common with producers, can look back upon a year of fair success in spite of the troubled state of affairs and the unstable markets. There is also every reason to believe that the present year will see a continuance of prosperity, and in increased magnitude. The weather experienced towards the end of last year was entirely favorable, and large crops may be expected as the result.

A fair amount of new land has been planted with rubber, cocoa and coffee during the past year, but there still remain unopened thousands of acres quite suited to rubber growing. It is also gratifying to note that up-to-date methods of cultivation are being more generally adopted.

With a view to bringing about a further improvement in the preparation and quality of plantation rubber, the Agricultural Department has issued a set of recommendations for the treatment of latex and the curing of rubber and its sorting, grading and packing. As regards the costs of production in the colony, the retrenchment enforced last year by the planters will compensate in the long run for the low prices of the products.

The balata industry is practically ruined because of the European war, and will continue to go from bad to worse unless the government adopts measures to afford the companies temporary aid. The financiers in Holland—or those directly interested in the Surinam balata industry—have not the money to make the necessary disbursements in the colony. Thousands of kilos. of balata are tied up in the colony, which under ordinary circumstances, would mean enormous amounts of ready cash in circulation. These facts are responsible in a great measure for all the misery experienced by the greater part of the population, who derive their living, directly or indirectly, from the balata industry.

It was in 1880 that Dutch Guiana entered the world's markets as a balata producer. She now supplies about one-quarter of the world's balata. Her largest exports were in 1913, with 1,155,540 kilograms (2,547,503 pounds), and she would have beaten all records last year but for the European war. The government—by order of the Ministers in Holland

has declined all applications for balata concessions, pending further communications from the Hague. Several persons are desirous of prospecting new tracts, for exploitation when the crisis is over, but no prospecting licenses will be granted.

It is encouraging, however, to note that the Governor is devoting serious attention to the economic condition of the colony in the present crisis. He has requested the Chamber of Commerce and the Labor Bureau to inquire into prevailing conditions and to forward a joint report to the government.

NOTES FROM BRITISH GUIANA.

By Our Regular Correspondent.

IN previous letters mention has been made of the anxiety felt here because of the gloomy prospects of the balata industry as a consequence of the war. Most local industries—sugar in particular—have benefited rather than otherwise as a result of the war, but the balata industry has been hedged round with many difficulties. The system under which this industry is conducted, by which the companies are called upon to send large stocks of provisions to their depots in order to provide the laborers with the necessities of life, threatened at one time to create a serious difficulty. In this colony, as elsewhere, prices rose suddenly after the outbreak of war, and the prospect of increased cost of production immediately presented itself. This danger was averted by the government, which appointed a committee to fix maximum prices for foodstuffs. But an even greater danger arose, a permanent solution of which has not yet been arrived at, although a temporary way out of the difficulty has been found.

The greater part of this colony's balata, as indeed of the world's production, has in the past found its market in Germany, and for the present that market is definitely closed to the British producer, however, the neutral producer may be able to make use of it. The largest producer of balata in this colony is the Consolidated Rubber & Balata Estates, Limited, and this company is in the unhappy position of having produced a record crop this year at a low cost, which it is unable to dispose of except at a sacrifice, perhaps even below the cost of production. Consequently recourse has been had to government assistance. The legislature has authorized the government to guarantee an advance of \$75,000 to be made by the Royal Bank of Canada to the local managers of the company, on a security of one pound of balata for every 15 cents advanced. The resolution embodying this policy met with some opposition, but was passed without a division.

The exact position of the company and, inferentially, of the balata industry, cannot be better explained than by quoting the governor's minute addressed to the Combined Court, which was as follows: "It is well known to the members of the court that the Consolidated Balata Co. controls very nearly the whole of the balata production and export in British Guiana. The company is in difficulties owing to the present condition of the balata market, caused by the war preventing the sale of large quantities of balata at a remunerative price. The company now has 667,000 pounds of balata, over which the Royal Bank of Canada has a lien on account of moneys advanced to the company. In addition the company has at New Amsterdam, at Potaro Mouth, in the Pomeroon, and on the way to these stations and to Georgetown, balata to the amount of 425,000 pounds. This latter balata is at present free from lien. Your approval is asked for the government to guarantee a further advance by the Royal Bank of Canada to the company to the amount of \$75,000, on the basis of the attached document. It is con-

- 19,352 (1913). Waist belt for garments, made of uncovered rubber. S. H. Thorp, Charters Towers, Queensland, Australia.
- 19,418 (1913). Block tire. H. P. Haas, 112, Boulevard de la Seine, Brussels.
- 19,425 (1913). Horseshoe with rubber pad. J. Opladen, 28, Schaafenstrasse, Cologne, Germany.
- 19,462 (1913). Pneumatic wheel tire. J. Wallace, 35, Darwen street, Blackburn.
- 19,464 (1913). The inflating valve consisting in part of a rubber cone. F. A. Poupard, 4, Chestnut Road, W. Norwood, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 31, 1914.]

- 19,869 (1913). Finger stall or bandage of rubber. H. R. Jackson, 11, Ingelow Road, Battersea, London.
- 19,940 (1913). Tire of rubber with soft rubber core. W. H. Carmont, 74, Eden street, Kingston, Surrey.
- 19,950 (1913). Leather faced rubber driving belt for motorcycles, etc. Dunlop Rubber Co. and C. Macbeth, Manor Mills, Salford street, Aston, Birmingham.
- 19,994 (1913). Toy pistol with elastic strip controlling release of projectile. G. C. Lasares, 319 State street, Boston, Mass., U. S. A.
- 20,035 (1913). Rubber and canvas gaiter for insertion between the air tube and cover of a tire. S. C. Caddy, Kildare, Keynsham, near Bristol.
- 20,185 (1913). An tube for wheel tires. Motorists' Purchasing Association and C. C. MacDowell, 170, Piccadilly, London.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

- 472,507 (May 16, 1914). Protective nail pulker. J. Simonet.
- 472,509 (May 18). Wheel tire. J. Leoviguit.
- 472,548 (May 22). Elastic automobile tire. E. E. Rousse.
- 472,595 (May 22). Elastic wheel tire. B. Buscaglia.
- 472,712 (August 13, 1913). Improvements in hernial bandages of rubber. F. Canvin.
- 472,735 (May 27, 1914). Small elastic heel for footwear. J. Brouillard.
- 472,753 (May 28). Substance replacing rubber or leather and its process of manufacture. E. B. Cook.
- 472,789 (August 18, 1913). Soft or hard plastic substance. F. E. Falvet.
- 472,846 (May 30, 1914). Improvements in covers of pneumatic tires. J. D. Tew.
- 472,852 (May 30). Substance analogous to leather, suitable for molding and hardening. R. Miller.
- 472,869 (August 22, 1913). Improved dress shields. H. Bloch and V. Gelas.

- 47,885 (June 2, 1914). Shaping apparatus for tire carcasses. E. C. Morton.
 47,934 (May 6). Process of preparation for rendering pneumatic tires watertight. H. Lewison.
 47,936 (May 6). Tire composed of small blades close to each other. E. Spiegel.
 473,003 (August 22, 1913). Protected air chamber. P. Labadie.
 473,006 (June 3, 1914). Tire for automobile wheels with antiskid grooves. E. Krest.

[Note: Printed copies of specification of French patents can be obtained from R. Bobet, Ingenieur-Consult, 16 Avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity.)

- 281,262, Class 39b (December 23, 1910). Process for production of plastic or elastic masses. Julius Stockhausen, Crefeld.
 281,268, Class 39b (December 21, 1911). Process for production of plastic or elastic masses from glycerine gelatine, etc. Julius Stockhausen, Crefeld.
 281,202, Class 55d (December 9, 1913). Pressing roller for paper machine with a rubber jacket under the influence of an air hose fastened to the core of the roller. Richard Schultz, Diefenbachstr., 57, Berlin.
 281,376, Class 71a (January 25, 1913). Extensible heel with horseshoe shaped rubber edge. Paul Pieper, Herderstrasse, 79, Dusseldorf.
 281,431, Class 77a (August 14, 1913). Closing of needle stitching on rubber playing balls. Gummiwaren-fabrik M. Steinberg, Kohn-Linden-thal.

THE COLONIAL TIRE & RUBBER CO., LIMITED.

The above is the title under which the firm hitherto known as Harry R. Sayer, Limited, will hereafter do business, the name of the concern having been changed on January 21. This company deals in rubber goods of all kinds—tires, clothing, footwear, drug sundries, hose, belting, packing, etc.—with headquarters at Vancouver, and a branch at Victoria, British Columbia.

RUBBER PLANTATIONS NEAR HOME.

A CORRESPONDENT suggests the following: "One lesson of the war that is being thoroughly impressed on the rubber trade is the necessity of having our rubber supply near at home and under our own control. England dominates the rubber plantations in the Far East, which are intended to supply the world with rubber. There is no doubt about the supply, but the great distance, militant Europe and Asia and the embargo are very apparent obstacles. What avails a producing plantation owned by Americans in Ceylon or the Malay States when in times of war the embargo and contraband list prohibit shipping, even under the American flag?"

The cultivated *Hevea Brasiliensis* produces under normal conditions, say, 4 pounds of rubber per year. An acre planted with 100 trees will produce 400 pounds a year, and five acres will produce one ton. The United States consumes about 50,000 tons yearly. This can be produced on 250,000 acres with 25,000,000 bearing trees.

The shaded portions of the map show where the *Hevea* is or could be cultivated profitably. The map indicates regions along important rivers or near the coast that are easily accessible. Millions of acres of good land are thus shown. Vast tracts away from the rivers are also available.

THE RUBBER TRADE IN CANADA.

CANADIAN imports and exports of india rubber, gutta percha and manufactures of, for six months ending September 30, 1914, by countries, are officially stated to have been in value as follows:

	IMPORTS—FREE			
	United States	Great Britain	Other Countries	Total Value
Crude rubber and gutta percha.....	\$1,182,746	\$267,351	\$56,059	\$1,506,156
Reclaimed	386,913	1,933	161	389,007
Waste	53,681	25	209	53,915
Other	21,935	16	21,952

MAP SHOWING TERRITORY AVAILABLE FOR *Hevea* PLANTING NEAR HOME

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

THE market is not very active at present. The most important feature is the question of freight rates and cargo space for the shipment of European chemical products. Freight rates are increasing and cargo space is becoming almost impossible to obtain, indicating a resumption of general commerce. With the German commercial fleet tied up and many boats of the Allies commandeered for war purposes there is not sufficient accommodation for the freights offering. Notwithstanding the above it must be noted that the general trend of both domestic and imported chemicals is tending downward.

Pigments generally are quiet and whiting has advanced. Some foreign grades of zincs have arrived, but as spelter and zinc ore have risen these products are quite firm. Foreign barytes is still arriving in spite of previous notice that no more would be shipped.

Crude Rubber During 1914.

THE year 1914 opened with a normal market for crude rubber, both as to prices and receipts and under the ordinary fluctuations, prices had receded by the end of June to 67 cents for Upriver fine and 57 cents for First latex crepe.

At the opening of the war, during the early days of August, a most remarkable rise in crude rubber quotations took place, the price of Upriver fine jumping in a few days to \$1.25, while First latex crepe had followed it to \$1.23 per pound.

These figures ruled for but little over a week and although the demand on the part of manufacturers was active sales were comparatively small and were reported at \$1.10 to \$1.20. Imports of all kinds during the month amounted to 3,224 tons.

By the middle of August the receipt of several large consignments and the expectation of further arrivals broke the market. Upriver fine quickly dropped to 90, First latex crepe reached the same figure and from this time a steady decline set in for both Upriver fine and First latex.

These extreme variations in price took place without any panic or extraordinary disturbance in the market. Realizing the inevitable result of the interruption of shipments, due to the hostile disturbance of oversea commerce, the embargo, etc., manufacturers prudently withdrew from the market toward the close of October, working up their stocks and refraining, as far as possible from buying in the hope that efforts being made would result in the early removal of the embargo.

The chart printed herewith and accompanying tables will make the movement of crude rubber in 1914 as compared with the preceding year perfectly clear. The heavy line indicates the fluctuations in Upriver fine in 1914, the heavy dotted line the variations of First latex crepe for the same period; the lighter lines show the movement on the same grades for 1913.
